The raw material from which are produced the almost countless varieties of sticks in the market is brought from nearly every part of the earth. There is a large quantity grown in England, but the bulk is foreign. To get an idea of the vast quantity of foreign sticks imported into England, one should visit the London Docks, East Smithfield Entrance Warehouse, No. 1, which is one of the largest storehouses of the kind in England. Here, piled from floor to ceiling, are all sorts of sticks imaginable: pimento, olive, myrtle, hazel, oak, ash, orange, bamboo, Tonquin canes, and a host of others, in such profusion as to be bewildering. It must be seen to be realised, by any person outside the trade. It would be impossible to name all the different kinds of raw material; but the following are the names of the most important: Olives from America, Queensland, and South Africa. Pimento from the West Indies, chiefly Jamaica, from which island from three to four thousand bundles, each containing from five to eight hundred sticks, are imported annually. Many of these sticks are sawn up into half-a-dozen smaller ones. Myrtle from South Europe, and most of the countries situated round the Mediterranean Sea. Ash from America, South Europe, and South Africa. Cornel or cornelian cherry from Mid and South Europe and some parts of Asia. This wood is very tough, and was used extensively when the 'acacia' became popular. Also several varieties of each of the following: Oak, orange, cherry, hazel, thorn, Ceylon vines, supple-jacks, palm, orange, crab, birch, beech, sycamore, lancewood, ebony, Amboyne, tulip-tree, snakewood, rosewood, Whangee, Jambeze, Penang, Rajah, Partridge, bamboo, Tonquin, betel, Malacca, Nana, Madagascar, Whampoa canes, bird's-eye maple, greenheart, &c. The chief produce of Great Britain are: Oak, ash, furze, birch, hazel, thorn, beech, crab, sycamore, cherry, and many other minor varieties. This list will show the great amount of skill required to become a judge of the raw material only.

But though extensive, the raw material is nothing compared with the multiplication of species, which arise as manufacture proceeds. The reason of this lies in the fact that from nearly every kind of raw material several distinct kinds of sticks are produced. One illustration will make this clear. Olives for walking-sticks are subject to nine different processes—sawing, filing, straightening, finishing, staining, varnishing, pumicing, finecoating, and ferruling. In large houses, each process is carried out by different

workmen. More than this—it is possible to take half-a-dozen olives, and, by treating each of them differently, to produce a corresponding number of sticks, which are known in the market as pepper, nutmeg, cinnamon, Australian bay, acacia, and olive—six distinct kinds from the same wood. This is done more or less in every branch of the trade, especially among what is known as 'Naturals,' that is, sticks made from the single branch of a tree. The handle is made to the desired shape from a piece of a thicker branch, which is left on for that purpose when the stick is cut. As it is difficult to get a sufficient quantity of sticks grown like this, the difficulty is met by joining the required piece on. The joint is so neat that most people would never notice it, or if they did, it would be more by accident than design.

The other great branch of work besides the natural is called 'Fancy,' and embraces carving, bending, inlaying, and everything which might be described as other than natural. There are many curious things made up into walking-sticks, such as snake-skins stretched on wood, sinews of large animals, sunflower stalks, cabbage stumps, sticks rendered curious by nature, some of which are of very strange and fantastic growth. The most curious stick the writer has ever met with was made as follows: A smooth round stick, on which knots were made with plaster of Paris, and then covered neatly all over with American table-covering, the pattern of which resembled the grain of wood. The edges were joined so neatly as to be invisible. The whole produced a very novel and peculiar stick, which deceived many experts, who, believing it to be wood, were puzzled at the peculiar grain. It was only by cutting a piece off that the trick was discovered.

Many pieces of very rare wood are made into walking-sticks—pieces of old ships, &c., beside scarce specimens of wood almost unknown, such as Myall wood, Australian black wood, muskwood, Cypress pine, zebra wood, kauri pine, deodar wood, calamander, sabicu, and occasional pieces of lignum vite. The 'modus operandi' whereby sticks which grow crooked are made straight is not generally known, and has been the subject of some curious speculation. We do not remember to have met with a satisfactory account anywhere in print, although at different times sage advice has been given on the subject through the press, in answer to correspondents. All such advice, so far as we know, has been more or less erroneous and absurd. The main object is to render the wood or cane soft and pliable; to do this, it is plunged into heated sand. Woods such as oak, ash, orange, &c., require wet sand; while olives, pimento, and all varieties of cane, require dry sand. In addition to this, a contrivance called 'a horse' is used, which consists of a plank of beech two inches thick set up on one end at an angle of forty-five to sixty degrees. Out of the two edges of this plank, pieces are cut, to allow the insertion of the stick. When sufficiently heated, the stick is taken from the sand, and, using it as a lever, it is bent here and bent there until it is perfectly straight. This process is repeated at a later stage, which is called 'baking.' For this second process, dry sand is used; and the stick is not only made quite straight, but as stiff

as it is possible to make it. The success of this process depends entirely upon the judgment of the workman, who is known as a 'kilnman.' He must determine how much heat is required, and whether wet or dry sand. If he gives too much heat, the stick becomes stunned, and in most cases is useless, as it will rarely come straight after. If, on the other hand, he does not make it hot enough, it is liable to break in halves.

Wet sand is also used for bending purposes; but a more improved method for sticks requiring moist heat is to boil them in water. For bending canes and wood requiring dry heat, a powerful gas jet is used. All such work requires an extensive knowledge of the nature and growth of the material to be operated upon, and a large amount of skill in the process.

The dealers in raw material and the manufacturers are generally different persons; but during recent years, several large manufacturers have engaged in both kinds of business. There are several kinds of raw material, such as cherry, orange, &c., the supply of which being limited, is controlled almost exclusively by several of the leading manufacturers. Among them, they buy up the whole available quantity as soon as it arrives in this country. When secured, it is sorted, the best kinds picked out, and the remainder put back on the market for sale.

During the last decade, many important changes and improvements have been effected in the trade, nearly all of which may be traced to the general use of steam-power in place of manual labour, used hitherto. It began by the introduction of an elaborate system of band-sawing, to do the heavier kinds of work. A considerable saving in raw material was the first result, and many varieties of wood not in use at that time were successfully introduced. After this, steam-power was applied to turning, joining, varnish-making, and ultimately embraced the whole trade.

Although greatly developing the resources and extent of the business side of the trade, the innovation has certainly not improved the quality of work produced, neither has it raised the moral or material condition of the workmen. The reasons of this are (1) That by reason of the increased keenness of competition consequent on improved means of production, prices have gone down, and quality also in exact proportion; (2) That wages have declined in proportion as prices have fallen; and (3) That quality being adapted to the ruling prices, the workmen are satisfied with inferior results of their labour as compared with former times. Taken altogether, the trade seems quite different from that of twenty years ago. There is a larger and more varied supply of raw material, which in turn causes a more than ever bewildering variety of sticks in the market. The margin of profit is much smaller, and very difficult to obtain, as some considerable credit has to be given. The most rigid economy prevails almost everywhere, and the division and subdivision of labour are more minute and exact than ever. Foreign competition is not very formidable. A not inconsiderable quantity of finished sticks have been imported from Austria and Germany, at different times; but, as a rule, the finish of the work is not up to the English market. The

process of refinishing has mostly to be performed by English workmen before such sticks are saleable here. The Austrian sticks have many excellent qualities; but the main fault will be best understood by saying, The ship has been spoiled for a halfpenny worth of tar.

THE MONTH:

SCIENCE AND ARTS.

THE recent eclipse of the sun seems to have been observed under the most favourable conditions by the different expeditions equipped for the purpose. The weather is described by Professor Pickering in a telegram from Minasaris as being perfect, and the results of his observations as satisfactory. Four immense streamers stretched for a distance of nearly half a million miles from the corona, and several solar prominences attained great distinctness and brilliancy. There was every evidence that the general condition of the sun was one of great disturbance, and a large number of spots were apparent. A comparison of the photographs taken at the various stations is looked forward to with great interest, and it is believed that the solar eclipse of 1893 will be a memorable one.

An *acrolite* is said to have fallen lately at St Louis, Missouri, breaking off the left arm of the statue erected in honour of John Brown, the well-known martyr to the cause of the abolition of slavery. It is further stated that Professor Joplin has analysed the stone, and has found that twenty-five per cent. of it consists of an unknown metal. If this report be true, and certainly it seems definite enough, we shall probably hear a good deal more of this messenger from starry space.

Experiments in freeing potable water from micro-organisms have recently been described in a German technical paper. The inquirers first of all reported some previous experiments in the simple addition of alum to water, a single grain of this compound to a gallon of water reducing the number of organisms in fifteen drops from eight thousand one hundred to eighty. Using larger quantities of alum, they were able to reduce the water to an absolutely sterile liquid. Another experimenter has detailed his investigations in the purification of water by sedimentation, and shows that during the storage of water in large reservoirs a natural bacterial purification takes place. Here is one of the results obtained: Thames water before being admitted to the reservoir of one of the London water companies was found to contain in every twenty-five drops 1437 microbes. These were reduced to 318 after the water had had time to rest; and after further rest in a second reservoir the number was reduced to 177. It has been long ago pointed out that the water of rivers undergoes a natural purification, and this, no doubt, is due to sedimentation.

We suppose that no habit has been more severely condemned and written against than that of opium-smoking. Now and then a

traveller has argued that the habit is not nearly so harmful as most persons imagine it to be, and they have actually asserted that it is not without beneficial effects. In a recent number of the 'Asiatic Quarterly Review,' Dr Nightingale speaks in defence of opium-smoking; and as the conclusions at which he has arrived are the result of personal experience obtained among the Chinese themselves, they are certainly worthy of consideration. He alleges that opium-smoking has the effect of warding off fevers and of allaying their effects, that it enables Chinamen to endure fatigue and perform heavy work in a high temperature which no other race of men would be capable of; and that it does not make its habitué quarrelsome, as alcohol does its victim in Western climes. He concludes that the more the matter is studied, the less harmful does the drug seem to be. If this writer's conclusions are correct, we are once more reminded of the advantage of looking at both sides of a question.

In California there is a six-mile tramway line which connects a certain town with a mountainous country in its vicinity, and on this tram line the curious spectacle may be seen of the horses riding on the cars. They first of all pull the car and its passengers up the steep gradient, and the car then finds its way back to town by gravity; and as it would be a useless waste of energy for the horses to run by its side, they are accommodated with a small platform at the back of the car. It is said that when they have an extra heavy load to pull up, they will frequently stop and make an effort to change places with the passengers.

News concerning the Antarctic whaling expedition which left Dundee many months ago has been received in that town. The four ships engaged in the enterprise failed in finding the valuable black whale of which they were in search, although they diligently scoured the ground where, according to Sir James Clark Ross, the animal used to be common. But seals were found in such abundance that between them the fleet secured no fewer than sixteen thousand pelts and a large quantity of oil. The absence of the black whale is attributed to the presence of its formidable enemy, the grampus. The seal-skins are said to be of unusual size; but it is impossible to appraise their value until later on. The weather encountered was most severe, and had the fleet been more favoured in this respect, an attempt would have been made to get farther south.

An interesting Report upon Jade in Upper Burma has been issued by Dr Noetling, of the Indian Geological Survey. There are, it seems, two different kinds of jade-mines—the quarry mines, which are on the summit of a hill, and the river mines. In the latter, the green stone is found in boulders in the river bed, and trained men dive for it. But in the hill quarries a wasteful and destructive method is adopted for winning the hard stone from its native rock. The rock is heated by means of large fires, and at night the cold is sufficient to crack it in all directions, after which wedges and crowbars are used to force the jade from its bed. Dr Noetling points to jade as being an example of a thing which is highly prized by the Chinese and Burmese, and is almost valueless to others. The

Chinese will pay for a piece of good jade as much as if it were gold, but there is no market for it outside China and Burma. With scientific appliances and the use of dynamite, the output of the mines could be enormously increased; but under present conditions the supply of jade is likely to diminish.

Some curious experiments have recently been carried out at Brest, having for their object the creation artificially of volumes of smoke, under the cover of which a torpedo boat can approach a hostile ship without being itself visible. The idea seems to be impracticable; but it has been considered worthy of protection by a patent, and its inventor, M. Oriolle, of Nantes, is confident of ultimate success, albeit he speaks of 'the consequences which may follow upon the discovery of a sure means of producing smoke or fog of sufficient stability and permanence.' It is singular that one set of warlike inventors should be busy upon the problem of doing away with smoke, while another is looking for a sure means of producing it in large quantities.

Some months ago, Mr Van der Weyde, the well-known London photographer, announced that he had invented a new apparatus, which he called the Photo Corrector, the object of which was to diminish the size of the head, hands, feet, or any other portion of a portrait, so as to correct any exaggeration which might easily be brought about by a too forward position of the sitter with respect to the camera. The means he employs is a supplementary lens of peculiar construction placed within the camera, close against the sensitive plate. This lens grasps, as it were, the light rays composing the part of the image needing correction, and while squeezing them into smaller compass, diminishes the size of the object. The idea is most ingenious.

A new and exceedingly useful application of the electric motor is exhibited in the 'Electrical Deck Planer,' which has been designed by Mr Malcolm Sutherland, of Dumbarton. This useful machine has the outward appearance of a lawn-mower, for it is pushed forward by a double handle, and has at its lower part a quickly revolving cutter, which, however, can be adjusted in height at will. The purpose of the invention, as its name implies, is to plane down decks and floors of all kinds, an operation which when performed with an ordinary hand-plane is very hard work, necessitating a cramped position for the labourer. The cutter in this instance is geared to an electro motor, and revolves at a speed of three thousand revolutions per minute. The machine borrows its power from a stationary dynamo, to which it is attached by flexible cables.

The New York 'Engineering Journal' recently published some interesting particulars concerning the employment of the metal platinum. The consumption of the metal for manufacturing purposes has increased from an insignificant quantity in 1880 to fifty-five thousand ounces last year. The increase is due, firstly, to the amount used in the manufacture of electric lamps. A large quantity is also employed yearly in the construction of stills for the concentration of sulphuric acid. For the attachment of artificial teeth to their supporting plates, platinum wire is used exclusively, and this industry uses many thou-

sands of ounces annually. Jewellers, chemists, opticians, and others also find uses for platinum; and of recent years a large quantity has been applied to the production of permanent photographs. The Siberian Urals have hitherto supplied ninety-two per cent. of all the platinum used in the world; but now Colombia, British Columbia, and the United States are competing with Russia in its production.

A well-known naturalist and Arctic traveller, Colonel Fielden, has suggested that the musk ox might with advantage be introduced into the Highlands of Scotland, where he believes it would thrive as well as it does in higher latitudes. This animal is covered in the winter-time with a long-stapled, light-yellow wool, as fine as silk, in addition to its coat of hair; and from this wool, stockings and other articles of clothing could be made, which would rival silk in softness and beauty. The animal is very easily tamed and reared; and Colonel Fielden says that they could be caught in any numbers in Jameson's Land.

Visiting cards are being made of iron with the owner's name printed upon them in silver. These cards are so thin that forty of them placed one upon the other are said to have a thickness of only one-eighth of an inch—each thin enough, we should imagine, to represent a very keen cutting edge.

We noted, some months back, several improvements which had been made in the Welsbach Incandescent Gaslight, in which, it will be remembered, a 'mantle' of incombustible mineral matter is suspended in the flame of a Bunsen burner, becoming white-hot. A battery of these lamps has recently been employed by Mr Treble, of Clapham (London), for photographic portraiture, and the light given is of such a highly actinic quality that it is possible to secure a picture at night in about five seconds. This new method of taking photographs in the absence of daylight is likely to become a favourite one, for the lamps give off no disagreeable fumes, and are cheap both in installation and maintenance.

Among the many methods in vogue for domestic decoration there is, perhaps, nothing more cosy and artistic than the old oak panelling with which our forefathers lined their rooms. Like many another good old fashion, this one has of late years been revived; and in houses of the better sort, panelled walls can now often be seen. As the work is far too expensive for general adoption, a modified process, patented by Messrs English Brothers, of Peterborough, by which the same effect is produced at about half the cost, is of some interest. This new panelling is in reality a thin veneer, which is associated with a cheaper wood. It can be screwed to rough deal fillets nailed to the walls; and great variety can be obtained by employing bird's-eye maple and other artistic woods in juxtaposition.

Coal which costs eighty-three pounds per ton to raise from the earth seems to be somewhat of a curiosity, yet that is the actual cost of raising from the Abram Collieries, Wigan, a huge block of cannel coal weighing over twelve tons, which is intended for the World's Fair at Chicago. Nine months were occupied in hewing out this monstrous lump of fuel, after which it was boxed up in planks and sent by train to Liverpool for

shipment to Boston. The cost price quoted does not include the expense of transport; and it is quite likely that before this 'black diamond' reaches its destination it will figure up to more than one hundred pounds per ton.

Electric lighting, which has already become so common, is expected to receive an enormous impetus as soon as the patents referring to the incandescent lamps and their belongings shall lapse, for their present price is out of all proportion to their actual cost. The price will also be still further reduced if a certain vacuum pump for exhausting the air from the little glass lamp-bulbs answers the expectations raised concerning it. This pump is the invention of Adolph Berrenberg, and is said to be in successful operation. In one hour it will exhaust six hundred lamps simultaneously, quite half this time being occupied in extracting the occluded gases from the carbon filaments. Hitherto, pumps have been used for this purpose which are very much slower in their action, and which are only capable of operating upon half-a-dozen lamps at one time.

The Committee appointed by the Board of Agriculture to inquire into the plague of field-voles in Scotland (of which we gave a full account in *Chambers's Journal* of June 25, last year) have recently sent in their Report. They estimate that more than one hundred thousand acres were affected by the pest, and that this visitation can be traced back to the year 1888. These little animals are so prolific, that under favourable conditions they increase most rapidly; and one cause of the outbreak is found in the favourable character of the seasons since the date above mentioned. Autumns have been wet, producing great luxuriance of grass on the hills, which afforded shelter to the voles; while winters, severe enough in England, have been mild in Scotland. A second cause for the plague is found in the destruction of hawks, buzzards, owls, stoats, and weasels by owners of game-preserves. All the witnesses examined by the Committee agree that the above are the main causes of the increase of voles. The damage done to the pastures is enormous, the habit of the vole being to eat the stem of the grass close to the ground, leaving the upper part to wither. This destruction of pasture naturally affects the rearing of stock most seriously. The Committee are reluctantly led to the conclusion that they are unable to recommend any specific method of dealing with or putting an end to the present outbreak; but at the same time they mention a number of remedies which in certain cases have proved effectual in diminishing the number of voles, and it cannot be said that their work has been altogether in vain.

Another bullet-proof fabric is presently to form the subject of experiments before a military Commission. In this case, the inventor does not claim that the material will be suitable for clothing, but he maintains that it will be useful in the construction of light portable screens, which will be quite capable of preventing a bullet reaching its billet. The inventor is Herr Sylander, of Pressburg.

M. Herrmann, the well-known conjurer, has been writing to an American journal concerning the wonderful feats attributed by travellers to

Indian jugglers. He once regarded India as the Mecca of magicians, and he went there in quest of knowledge. Most wofully was he disappointed. All the well-known tricks which have been retailed again and again, he expatiates upon. Some are simply travellers' tales; and he never saw them performed. The others can be very much better done by many a European prestidigitateur on his platform. The Indian juggler, he tells us, never advances, and never originates. Their tricks are clumsily performed, and of the most primitive kind. Thus ends one more of our childhood's illusions.

It has long been the custom to describe a very copious downpour as 'raining cats, dogs, and pitchforks,' and one of our greatest caricaturists, George Cruikshank, long ago gave the whimsical idea pictorial illustration. But romance and exaggeration have once more been outdone by reality. In a storm which occurred in New South Wales in October last, a reliable observer writes that 'substantial brick buildings came tumbling in all directions, and the air was full of iron tubs, galvanised iron, and tins of every description.' Hailstones fell in abundance, and many of them measured more than six inches in diameter. They slew sheep, kangaroo-rats, and birds, and the dead bodies were lying thickly on the fields. But the size and force of these terrible missiles will be better appreciated when it is mentioned that the hailstones made large holes in corrugated iron roofs. Trees twelve feet in circumference were snapped off by the winds as if they had been twigs. This terrible storm was described in all its details in a paper read before the Royal Society of New South Wales by Mr H. C. Russell, in November last.

A German process for depositing upon cotton cloth a brilliant and flexible coating of metallic tin is described as follows: Powdered zinc is made into a paste with white of egg, and is brushed into the surface of the cloth, the albumen being afterwards coagulated by a current of super-heated steam. The cloth is next immersed in a bath of perchloride of tin, when the metal deposits in a finely divided condition upon the cloth, which is afterwards dried, and passed through a calendaring machine. Very fine designs can be transferred to cloth in this way, and the invention is likely to meet with many applications.

In a recent article in *Chambers's Journal* (p. 116) on 'A Brazilian Convict Island,' it was stated that between 1884 and 1891 no British ship had visited the island of Fernando de Noronha. Mention was made of the 'Challenger's' visit in 1873, when permission to collect specimens of the fauna and flora of the island was refused. This, however, as we are kindly informed by a correspondent, was done with great success in 1887 by Mr H. N. Ridley, F.L.S., now Superintendent of the Botanical Gardens at Singapore. His party, of which our correspondent was a member, stayed for six weeks on the island, and explored the natural history as thoroughly as was possible, obtaining some fifty species new to science, and a full record of the geology and petrology of the place. The expedition was sent out under the auspices of the Royal Society and the British Museum; and the results of its labours

were published in the following year by the Linnean Society, the reports extending over 190 pages of that Society's Journal. A paper, with a map of the island, will also be found in the Royal Geographical Society's Journal, 1888.

A LEGEND OF NIAGARA.

IN the vast continent known as North America, there still exist, though in a degraded and debased condition, the descendants of a once free and proud people. Originally the undisputed possessors of their rich and fertile country, their inheritance has dwindled; and now only a small territory remains. For, before the indomitable industry—and it is to be feared the overbearing oppression also of the white man—the Red Indian has been compelled to withdraw his claim to his patrimony. No doubt, however, the mischief has been aided by his incorrigible idleness, and a fatal fondness for the 'fire-water' of the stranger. But the legend I have to relate has to do, not with the degenerate posterity, but with their brave and noble ancestors.

Many hundred moons ago, there dwelt on the shores of the great fresh-water lakes a branch or tribe of this nation. They were a brave and warlike race; and dwelling in a district which was well stocked with bison, deer, and other animals, by the chase of which they chiefly subsisted; and possessing other advantages by their proximity to the lakes, they were, perhaps, the most powerful of the tribes into which their nation was divided. They were noted for the courage and skill of their 'braves,' as the young warriors were called, and they were no less famous for the beauty and modesty of their maidens. The fame also of their wise men, the elders of the tribe, had spread through the land, and many another tribe envied them their firm and gentle governance.

Among the young men of the tribe, none was more highly esteemed by its elders than Ahdeck, the son of the chief. Brave, handsome, and kind-hearted, he was the beloved of the people. The young braves followed him on the war-path or to the chase with confidence; and many a bashful glance beamed from bright eyes, as Ahdeck, returning from the chase, passed by where the matrons of the tribe instructed the maidens in the simple arts of their nation. It was felt by all that when Gitche Manito (the Great Spirit) called away the old chief to the happy hunting-grounds, he would leave a capable successor behind him.

But if Ahdeck was the leader of the young braves, among the maidens no superior was acknowledged to Nokomis; lithe and agile as the mountain deer, her countenance—to use an Indian metaphor—was like the full moon. Among the youth of the opposite sex, a smile or a word from Nokomis was sufficient for a day's happiness. But gradually despondency spread among the young braves, as it became whispered about that the brave Ahdeck himself had fallen a victim to the innocent wiles of the winsome Nokomis. And who could hope to successfully compete with Ahdeck? The trophies of his skill and courage were laid by him at the feet of Nokomis; and the Indian maid's dark cheek glowed as she saw the meaning smiles of her

companions. But many a young brave was heart-sick for love of the dark-tressed Nokomis.

Now the time came round when a solemn annual festival was wont to be held by this tribe. Dwellers by the great lakes, and living within the ceaseless sound of the thundering cataract, great was their veneration for the Spirit of the Falls. And it had been declared by an ancient wise man that only so long as an awful annual tribute was paid, would the powerful Spirit continue to protect them. Therefore, it was the custom annually for the maidens of the tribe to draw lots; and the chosen one seated in a canoe gaily bedecked with fruit and flowers, floated down the river to meet certain destruction at the Falls. As this festival drew nigh, anxious depression filled the mind of Nokomis. Every year, as long as she could remember, a young and innocent maiden had been sacrificed in this manner. What if she drew the fatal lot? In vain did Ahdeck attempt to comfort his betrothed; the soul of the Indian girl was filled with dark forebodings of coming sorrow. Just as her life had reached its goal of happiness, the dark shadow of approaching grief hung threateningly before her. As Ahdeck wandered at night beneath the silvery birch-trees on the banks of the river, his heart sickened with anguish at the thought of the possible end to his hopes; and he formed the stern resolution that if Nokomis died, it should not be alone.

The fatal day drew rapidly nearer: at last it arrived. The maidens of the tribe were gathered around Nokomis, weeping, for, alas! the lot had been taken, and the beloved of Ahdeck was to die! Not to Nokomis had Ahdeck breathed a word of his resolve. And to neither of them had the thought of flight suggested itself; or if it had, only to be instantly dismissed as unworthy of an Indian.

The whole tribe was assembled on the bank of the river. All hearts were filled with sorrow and anguish, but none thought of violating the dreadful custom. To their simple minds, any deviation would have meant ruin, irretrievable and inevitable ruin for the whole tribe. It was a splendid autumnal dawn. A blaze of colour was on the foliage as the warm sun shed its beams over the far-reaching woods. To Ahdeck, nature seemed to mock him. How could the birds sing matins on such a day! He shuddered as he gazed upon the treacherous water, that rippled and dimpled in the early morning sunlight as if nothing unusual was about to happen, and thought how soon Nokomis would be lying stiff and lifeless beneath the waves!

Slowly the maiden drew near the bank, attended by her weeping friends. She was attired in white, her dark hair garlanded with the rich red autumn leaves. The last agonising farewells were made; but Ahdeck was absent. With piteous eyes, Nokomis looked around for him; but he was gone, and with a breaking heart, she stepped into the frail boat—which was decked with the gayest flowers that could be found—the hapless victim of an ignorant superstition. The priest of the tribe drew his knife and cut the rope that held the canoe to the shore, and slowly but with gathering speed it launched out into the current of the rapid flowing stream. The people gazed.

But see! another canoe has thrust out from

the bank, impelled by a vigorous arm. It is Ahdeck. The elders gaze anxiously. Is he about to rescue her! Then would they fear the wrath of the malevolent Spirit! But such is not his purpose. Swiftly he overtakes the canoe in which the unhappy girl is kneeling. With a cry of joy she welcomes him as he steps into her canoe; and hand clasped in hand, they float down the river, cheerfully acquiescing in the fate that permits them to die together. Swiftly and yet more swiftly they approach the frightful fall: one sudden swoop, and it is over! The awe-struck spectators peer fearfully into the deep dark pool beneath. For a minute the mingled tresses of the devoted pair are seen to dance on the white foam, and then disappear for ever.

It is not easy to describe the effect of the tragedy. Accustomed to the yearly tribute, the tribe had callously grown indifferent to the suffering involved. But now, the blank left by the death of Ahdeck and his bride made indifference impossible. Before the next festival came round, the camp was moved, and for many years the Falls were avoided. When they finally returned, the custom was never renewed. Not in vain had the lovers died!

Indian lovers, however, wandered on the river banks as before, and talked of the unhappy fate of Ahdeck and Nokomis, and glancing timidly at the deep blue sky above, pointed out to one another the bright twin-stars which appeared overhead at harvest-time; and told how the Great Spirit had taken compassion upon Ahdeck and Nokomis, and snatching them out of the cruel water, had placed them in the sky, for ever to adorn the bright heavens.

SONNET.—IN ILLNESS.

They also serve who only stand and wait.
MILTON.

'THE broken threads of life's all-tangled skein
I will take up when I am better!' So
The heart, hope-prompted, cries when that we grow
Each day more frail in illness, and the pain
Of dull inaction, knowing that but vain
Th' attempt to rouse the prostrate powers that now
No more their wonted active vigour show,
As if some palsy hand on them had lain!
Ah, it may be that in life's evening hours
The discipline is not to do, but *be*;
To know the broken threads no longer ours
To weave and fashion; and resignedly
To fold the hands—that wait the amaranth flowers
To clasp—in humble faith contentedly!

CAMILLA CROSLAND.

SMAILHOLM TOWER.

A FEW miles north of the Tweed, in Roxburghshire, on an outcrop of trap rock nearly seven hundred feet above the level of the sea, stands the ancient and classic keep of Smailholm. It is seen from all the country round, standing, as Dr John Brown puts it, 'stark and upright as a warler.' It has two claims upon the interest of the literary reader. It was the witness of some entertaining episodes in the early life of Scott, and it was the scene of his strangely weird and eerie ballad 'The Eve of St John.'

Smailholm, more than the site of College Wynd in Edinburgh where Scott was born, and more than George Square where he was brought up, is closely associated with certain features of Sir Walter's life, because he, in his Autobiography, has recalled many graphic details of the period of his young life which he spent there. The rock on which Smailholm Tower is built is called Sandyknowe Crags, and near by stands Sandyknowe Farm. This farm was the birthplace of Sir Walter's father, and the residence in Scott's youth of his grandfather, Robert Scott. The 'Author of Waverley' was, as every one knows, a cripple—tall and strong and well built, but yet lame—the lameness being due to an inequality of the lower limbs. He had not, however, been born so. It was not till his eighteenth month that he was attacked by some kind of paralytic affection, which left him permanently lame. 'One night,' he says, 'I have been often told, I showed great reluctance to be caught and put to bed, and after being chased about the room, was apprehended and consigned to my dormitory with some difficulty. It was the last time I was to show such personal agility.' Next morning he was found to be affected with fever, and on the fourth day afterwards the melancholy discovery was made that the child had lost the power of his right leg.

It was in the hope that the boy, with his naturally good constitution, would throw off the partial paralysis, that he was sent to breathe the

free air of the country at his grandfather's high-lying farm of Sandyknowe. He was then about his third year, and it is characteristic of the wonderful powers of memory which he manifested in his mature years, that he so vividly recalls many episodes of his existence when but three years of age. 'It is here,' he says, 'at Sandyknowe, that I have the first consciousness of existence; and I recollect distinctly that my situation and appearance were a little whimsical. Among the odd remedies resorted to, to aid my lameness, some one had recommended that as often as a sheep was killed for the use of the family, I should be stripped, and swathed up in the skin warm as it was flayed from the carcase of the animal. In this Tartar-like habili-ment I well remember lying upon the floor of the little parlour in the farmhouse, while my grandfather, a venerable old man with white hair, used every excitement to make me try to crawl.' A neighbour and relation, old Sir George MacDougal of Makerston, in his cocked-hat and scarlet waistcoat, used also to assist on these occasions by getting down on his knees and dragging his watch across the carpet to induce the child to follow it. 'The benevolent old soldier,' as Scott remarks, 'and the infant wrapped in his sheep-skin, would have afforded an odd group to uninterested spectators.'

The boy being a favourite with the servants, was often carried up to the crags on which the old tower stands by his grandfather's shepherd or ewe-milkers, and here first dawned upon him some consciousness of the strange world that lay around him. In manhood, when he was writing 'Marmion,' he tells us how the remembrance of those early days and the tales he then heard still roused his feelings and glowed in his verse:

Then rise those crags, that mountain tower,
Which charmed my fancy's wakening hour....
It was a barren scene, and wild,
Where naked cliffs were rudely piled;
But ever and anon between
Lay velvet tufts of loveliest green....

I deemed such nooks the sweetest shade
The sun in all its rounds surveyed ;
And still I thought that shattered tower
The mightiest work of human power.

It is difficult to estimate the influences which such a scene had upon the dawning consciousness of the boy, and almost useless to speculate about them. Genius works out its own ends, and scatters its riches where it wills. Other boys had wandered about those crags, and no doubt wondered, as Scott did, at the great tower, with its black blank window-spaces, its long winding stair, its battlemented summit, its ironed doorway ; and yet no strange thing thereby wrought in their brain. But to Scott it was precisely the environment in which the germ of genius within him could best fructify and ripen. The barren scene, the naked cliffs, the gaunt and empty tower—these, at first thought, looked but little qualified to excite the emotions or to fire the imagination. ‘Yet,’ says Scott—

Yet was poetic impulse given
By the green hill and clear blue heaven.

This ‘poetic impulse’ is indeed as the wind—we know not whence it cometh, or whither it goeth.

If you would visit this spot in the uplands of the Merse sacred to the childhood of the Great Magician, it may be done either from Kelso or Dryburgh. It is a walk of seven miles either way, and as many more back. The most picturesque way is by Dryburgh, in which case the traveller by the Waverley Route leaves the train at St. Boswells Station, lying under the very shadow of the Eildons. A walk of a mile brings you to the Tweed, here spanned by a foot-bridge, and giving a glimpse of the river as it sweeps down from Old Melrose and Bemersyde, and plunges beneath the red cliffs on which the ruins of Dryburgh Abbey stand. And here, in passing, you may pause and turn aside by that ivy-mantled wall, which leads you along a winding path between the shining boles of overhanging beeches, and there before you is the beautiful fragment of St Mary’s Aisle, which holds within its solemn precincts the sacred dust of Scott. Let us recall that sombre September day—’tis now sixty years since—when he was borne thither to his final rest.

‘The courtyard,’ says Lockhart, ‘and all the precincts of Abbotsford, were crowded with uncovered spectators as the procession was arranged ; and as it advanced through Darnick and Melrose, and the adjacent villages, the whole population appeared at their doors in like manner, almost all in black. The train of carriages extended over more than a mile—the Yeomanry followed in great numbers on horseback—and it was late in the day when we reached Dryburgh. Some accident, it was observed, had caused the hearse to halt for several minutes on the summit of the hill at Bemersyde—exactly where a prospect of remarkable richness opens, and where Sir Walter had always been accustomed to rein up his horse. The day was dark and lowering, and the wind

high. The wide enclosure at the Abbey of Dryburgh was thronged with old and young ; and when the coffin was taken from the hearse, and again laid on the shoulders of the afflicted serving-men, one deep sob burst from a thousand lips. Mr Archdeacon Williams read the Burial Service of the Church of England ; and thus, about half-past five in the evening, the remains of Sir Walter Scott were laid by the side of his wife in the sepulchre of his ancestors—“in sure and certain hope.”

This old abbey where we now are, is one of the most picturesque ruins in Borderland. The green plateau on which it stands is half encircled by the full-flowing Tweed ; and the many aged trees—oak and ash and melancholy yew—planted by hands that have long since mouldered in the churchyard dust, give an aspect of serene awe and beauty to the place. Around the ruins, underneath the scattered headstones of the graveyard, reposes the common dust of common men ; but here, in St Mary’s Aisle, is the granite cenotaph that covers the sleeping-place of him who yet liveth, and shall live for evermore.

But let us leave him here in his dreamless sleep, and seek the heights where the tower of Smailholm stands. Thither, there are more roads than one ; but any native will point out the hill road by Mertoun Mill, and near Mertoun House, in which Scott wrote ‘The Eve of St John’—leading amid umbrageous trees down to the Tweed, where it sweeps along in unbroken majesty. It is an old road that thence runs upwards, with deep ruts, and long-intended roadway, rough with stones. It reminds one of an English lane, with its steep banks on either side, rich with the summer’s greenest grass, long and wind-shaken, and thickly set with wild-flowers. Upwards it runs, now between high hedgerows, and now beneath the dark shadow of scented firs, till, after an hour and more, you come out on the high moor at the back of Smailholm Crag, and there, before you in the distance, is the old tower, looking more than ever bare and barren after the rich peninsula of Dryburgh, its rocky site led up to by stretches of bog-land and stunted heath—a dreary wilderness, brown, desolate, wind-smitten.

When the castle itself is reached, it is found to be a tall and narrow Border keep of the conventional type of the sixteenth century. It was built by one of the Pringles, in the days when the Pringles were a numerous and powerful sept in the Merse and by Tweedside. The tower stands at one corner of the courtyard, or ‘barmkin ;’ but only a fragment of the inclosing walls remains. There are also some vestiges of a small chapel. The tower itself is intact. Unlike Bemersyde Tower, which otherwise it closely resembles, Smailholm has only one vaulted room—namely, that on the ground-floor. Usually the roof of the hall on the first floor is arched over, or vaulted, also ; but in Smailholm the ceiling of the hall must have been a flat one of oaken beams, the stone supports for which on each side still exist. The tower is accessible on three sides of the sloping ascent ; but on the fourth or south side, its site terminates just under the walls in a precipice of rock, at the foot of which lies a gloomy and stagnant lochlet of brown bog-water. Beyond this, a few hundred yards down the

southern slope of the hill, stands the farm of Sandyknowe, which we have just alluded to as the scene of Scott's infantile recollections, and all around are the rocks and crags and patches of velvety green as they impressed themselves on his childish imagination.

But the mystic spell which hangs about the old keep is not due either to its historical associations—for these are of the meagrest—or to its immediate surroundings, which are commonplace, though wild. That spell is due to 'The Eve of St John.' Scott wrote this ballad in 1799 at Mertoun House, and the subject was suggested to him half in jest. He had been urging his relative and host, Lord Polwarth, to make certain repairs upon Smailholm Tower, which was in parts dilapidated. His lordship assented, on the condition, half playfully made, that Scott should write a ballad of which Smailholm should be the scene. Scott agreed. Up to this time, though he was then twenty-eight years of age, Scott had not written anything of notable merit. He had made a few rhymed translations, and composed a few fragments in ballad style; but, under the inspiration of Smailholm, and his early reminiscences of it, he struck out at once, in 'The Eve of St John,' a piece of genuine ballad poetry, deeply infused with weird and wild imaginings, heightened by the gloomy and eerie imagery that well befitted the dark superstition embodied in its verse. Never, in all his writings, did Scott again touch so deep a note of unholy glamour, except perhaps in that fearful episode in 'Redgauntlet,' written twenty-five years later—'Wandering Willie's Tale'—as enthralling and blood-chilling a story of the supernatural as was ever uttered, its lurid horrors lighted up by an occasional gleam of humour that does not make the reader laugh, only deepens the spell of nameless terror in which he is held bound. Let any one who is fascinated with the artificial supernaturalism and wonder-mongering of certain of our modern novelists, lay these later efforts for a moment aside, and once more turn to Letter the Eleventh in 'Redgauntlet,' and read in its proper setting 'Wandering Willie's Tale.'

The view from the top of Smailholm Tower is one of the most far-reaching and magnificent in the south of Scotland—from the sea at Berwick-on-Tweed on the east to the far hills of Ettrick and Yarrow on the west; from the Lammermoors on the north to the blue girdle of the Cheviots that shut in the southern borders of Teviotdale. You can still enter the tower-gate as did the Baron of Smailholm, and mount the narrow stair to the bartizan-seat; and though you will not there find the lady, 'with maids that on her wait,' you can yet look as she looked 'over hill and vale,'

O'er Tweed's fair flood, and Mertoun's wood,
And all down Teviotdale.

On your right is the Watchfold, where the beacon-lights were wont to blaze out their stormy warnings, and where the Lady of Smailholm held unholy tryst; and behind you is 'the rocky way' which 'leads to Brotherstone,' by which the vengeful Baron, 'without stop or stay,' rode forth on his revengeful quest. Standing on the summit of Smailholm you can see the Borderland as perhaps it cannot be seen from any other given

point, with its richly-mingling hill and vale, wood and stream, all heightened by the charm of old associations, and illumined by the light that was never yet on sea or land.

J. R.

THE BURDEN OF ISABEL.*

By J. MACLAREN COBBAN, Author of *Master of His Fate*;
A Soldier and a Gentleman; &c.

CHAPTER XXIII.—WHAT WILL SHE DO WITH IT?

NEXT day there commenced a new epoch in Isabel's life. Her uncle came early, as he had promised, and at once opened his business to her.

'Well, my dear,' said he, 'poor Uncle Harry's gone, and he couldn't take his hard-won brass with him. To do him justice, he was not the kind of man that wanted to; he knew he'd have to leave it—though he hoped to enjoy it a little longer himself—and, to do him justice again, knowing he had it to leave, my dear, he fixed on the best heir to it that he could have chosen. I know that, my girl, because I saw the will when it was drawn up, and I am set down in it as executor. And who, do you think now, my lady, he has appointed his heir?'

'It would be absurd,' said Isabel, turning very pale, 'to pretend, uncle, that I don't know what you mean, and whom you mean, and that I don't now understand what you were hinting at yesterday. But I think you must be mistaken.'

'No mistake at all,' said Mr Suffield. 'You're his heir, my girl—and the best he could have chosen.'

'Still, uncle dear,' persisted Isabel, 'I would not be too sure about it. It was some weeks ago—was it not?—that he made that will; and things have happened since then: he was made angry and disappointed: he may have made another will that you don't know of.'

'Another will?' exclaimed Suffield, blushing with indignation. 'He wouldn't do such a thing! No, no. His property is all personal, and you've come into the enjoyment of it, to the tune of three or four thousand a year.'

'Three or four thousand a year,' exclaimed Mr Raynor, who had listened with interest, but unmoved until now. 'Has Harry made all that?'

'He has, John,' answered Suffield: 'coined it out of his brains and blood, you may say.'

Mr Raynor looked deeply envious an instant, then his brow cleared, and he rose and came to his daughter and took both her hands in his.

'I congratulate you, my child,' said he, in a voice that thrilled with emotion. 'I have not been able to provide for you as I ought; but I rejoice exceedingly that it has been reserved for one of my own blood to provide for you so nobly. That, to my mind, reflects a generous lustre back over Harry's whole life.'

'What?' said Suffield. 'Did you find Harry's life needed something of that sort, then, John?—But we had better not discuss it. We must go to the lawyer's, my dear, to see the details of the thing.'

* Copyright reserved in the United States of America.

'I am ashamed,' said Isabel, 'that we should be talking of it at all now! It seems so dreadfully inhuman to be counting his gold over his dead body! Poor, dear Uncle Harry! I did nothing for him!—nothing at all!—that he should shower his wealth on me! Oh, I can't believe it's true! There *must* be a mistake!'

'You see, my dear,' said the practical Mr Sutfield, 'he was bound to shower it on somebody—unless, of course, he left it to an institution; and Harry always thought more of persons than of institutions—as I do.—But you must come away with me and make sure about it.'

So Isabel set out with her uncle; and her father settled down to talk of these strange and surprising matters with Doughty, who had just come in. At the lawyer's it was found that Mr Sutfield was right: that the will he spoke of existed, and that no other was known to exist. Unless, therefore, another will should be found among Uncle Harry's papers, when they came to be carefully examined, Isabel without doubt inherited all his property, with certain insignificant exceptions of small gratuities and presents bestowed here and there—notable among which was a legacy of fifty pounds to Daniel Trichinopoly.

A few days were enough to settle the point whether there was another will, and none being found, Isabel was, almost before she was aware, inducted into 'the usufruct' of her uncle's estate. It is not necessary to dwell on the details of this transition time. Two things only need be particularly mentioned: first, that she gave notice at the 'College for Ladies' that she would not return there after the end of the term—she did that with great good-will, though she thereby made herself liable to a fine of a term's salary; for she was not of those who take delight in the drudgery of teaching—and, second, that she had a long talk with Alan Ainsworth concerning her new prospects and designs.

Alan, having heard of the death and burial of Mr Harry Raynor, had let a becoming interval elapse before calling again on his friends in the Marylebone lodgings. It thus happened that he chanced to call on the very evening before the day when Isabel and her father purposed to travel with the Sutfields to the seaside. Mr Raynor—who sat alone with Alexander—at once opened the subject which in those days occupied much of his attention. Had Ainsworth heard of the extraordinary change in Isabel's lot? No; Mr Ainsworth had not. Not that she was the sole heir of Harry's property, and was now the recipient of something like three or four thousand pounds a year? No; Mr Ainsworth had not heard. And it might have been remarked, whether Mr Raynor remarked it or not, that while he made the admission Mr Ainsworth turned ghastly pale.

Then Isabel came in, and said she had been packing in view of their journey next day.

'And you were going,' said Ainsworth, 'without giving me an opportunity of saying "good-bye"?''

'I thought,' said she humbly, with a fresh touch of red on her cheek, 'since we had not seen you for some time, that you must be very busy, and would not care to be troubled: you have been very much occupied of late—have you not?'

'And,' said he, 'I understand you must have been very much occupied too: "The queen was in her parlour, counting up her money." You are now, I believe, the mistress of wealth beyond the dreams of avarice.'

'Oh,' said she, glancing towards her father with a slight contraction of her beautiful brows, 'my father has been telling you: he is full of the subject.'

'May I congratulate you?' said Ainsworth. 'I hope you will be happy in its possession, and I am sure you will spend it well.'

She looked at him frankly and half-sadly. 'You do not seem pleased,' said she, 'that it should have come to me.'

'Then,' said he, in his impulsive way, 'I am very ungenerous. But I *am* glad, truly glad, of your good fortune so far as it is good, and I hope you will be happy in spite of it.'—'You are going away,' he said, turning again suddenly to Isabel: 'if you can spare the time from your packing, let us all take a walk in the park, as we used to do. There will be no more walks when you return from your holiday; you will then be fully invested with your golden splendour, and nothing but carriage exercise must be thought of.'

'Yes,' said she; 'let us go into the park; but you must promise not to talk any more in that absurd strain.'

'I promise,' said he humbly.

Now it so happened that these two young people with the sincerest desire to be in accord were at cross-purposes of outlook. Ainsworth thought that Isabel's fortune now made all the difference in the world between them—and Mr Raynor had innocently emphasised that conclusion—while Isabel did not take her fortune into account as making any difference at all. The intent, therefore, of what each said to the other was a great deal misunderstood. Isabel saw that Ainsworth was disposed to make much of her altered circumstances, though she did not apprehend that he thought a gulf was now fixed between them, and she gaily and generously set herself to make him feel that she was the same Isabel as before, only with greater means to benefit her friends; while all these efforts to engage him in her interests Ainsworth took as more and more evidence that she was rejoicing in the new prospects that opened up for herself. He was very foolish; but remember he was at heart very sad and sore.

'I do verily believe,' said she, while her bright dark eyes sparkled as they stepped along together to the park, 'that you imagine I am going to turn all the gold poor Uncle Harry has left into a pedestal, and that I shall stand on top of it above all the common world I have known.'

'I suppose,' said he, 'that there is gold enough to make a pedestal of.'

'I daresay there is,' said she.

'I do think,' said he, 'that it is far too much for one person. What can one person do with so much?'

'Do?' she exclaimed mischievously. 'You do not seem to give me much credit for resource. First, I mean to spend a good deal on myself. I shall have as many new dresses as I like, and I shall get them made by the best dress-makers and the best tailors.'

'To attract,' said he, 'the attention of mankind all the day long!'

'Well, sir,' said she, 'and why not?'

'Why not, indeed?'

'But,' said she, 'you are wrong in thinking that a woman dresses to please men: she dresses chiefly to make other women envious.'

'Truly?' asked he, in his simplicity.

'Certainly,' said she. 'And then I mean to have a handsomely furnished flat: I have really very luxurious tastes.'

'Well,' said he, 'suppose all these personal expenses consume one of the thousands, what do you propose to do with the others?'

'There is my father,' said she seriously. 'And, really and truly, I confess that if it were not for him and for another purpose I have long thought of, I would rather, I think, not have the money: I would hand it over to my uncle, who has done so much for me, to whom I owe so much.'

'You would add water to the ocean,' said Ainsworth.

'Yes,' said she, 'it might look something like that. But I don't intend to do it. I have plans for my father that I cannot tell you about now. And then I have a great scheme which I used to dream about before there was any likelihood of my giving it practical shape: I want to make a Home for Aged Governesses. People have written about old donkeys: Dickens—or one of his young men—wrote an article about them once, as you know, of course, and asked what became of them; but no one has ever troubled to inquire about aged governesses, not even the parents of the children to whom they have been in place of parents. What becomes of them when they cannot play the part of parents any more? I don't know; but I wish to make sure that so many as I can entertain, who have no home of their own to go to, shall live in a big house I shall provide, where they will sometimes see younger governesses to remind them of past days—governesses who wish to take a holiday in town, or to look out for a situation.'

'Oh,' said Ainsworth, 'you would have your Home in London, then?'

'Certainly,' answered Isabel.

'Not at the seaside, or in the country?'

'Mr Ainsworth,' said Isabel, 'I did not think you would be so dull as not perceive my reasons for choosing London. Governesses have had enough in their lives of the seaside and the country; they are sick of the seaside and the country; and they do not need fresh air nearly so much as they need some wholesome excitement.'

'You are bent on giving them distractions and excitements, then?' said Ainsworth. 'That policy may have its advantage: you will kill them off quickly.'

'Really!' exclaimed Isabel, with a laugh, 'your misanthropy, or, rather, your misogyny, to-night is startling! But you are wrong again, Mr Ainsworth. Sufficient distraction and excitement are as necessary to civilised people as sufficient food—that, you must know, is the best scientific opinion—and my aged governesses shall have sufficient and no more, and so they shall prolong their days in the land. I'll make contracts with all managers of theatres'—

'Why not of music-halls?' interrupted Ainsworth.

'I must draw the line somewhere,' said Isabel; 'and I draw it there. The managers, I have no doubt, would be willing to quote reduced prices to a regular, and, as you may say, wholesale, customer.'

'I doubt very much if they would,' laughed Ainsworth—'especially to such a very wealthy person as you will be known to be.'

'Well,' said Isabel, 'let that pass; but I think I could prevail on them.'

'Oh,' exclaimed he, glancing with compulsory admiration at her noble and charming presence, 'if it comes to that, I have no doubt you could.'

'Then I should sometimes have Home dances. And you must come, Mr Ainsworth, and dance with my Aged.'

'I, Miss Raynor?' cried Ainsworth in abashed astonishment. 'I should be delighted, but I can't dance a bit!'

'Then, you must learn,' said she peremptorily.

'If I must, I must,' said he. 'When a great lady commands, she must be obeyed,' he added with a foolish and feeble touch of sarcasm.

'Of course,' said Isabel quietly, making the touch of sarcasm of none avail. 'And,' she continued, 'you must be one of my Committee of gentlemen. I don't know what I want a Committee for, since I intend to manage the Home myself; but it seems to be the regular and proper thing to have in such a case, and I intend to do all decently and in order.'

'Oh, a Committee,' laughed Ainsworth, 'need not interfere with your management. All it need do is to hear minutes, to propose, second, discuss, and accept or reject motions; and all you need do is to provide your Committee with a room to sit in, and a table to sit at, the table being furnished with a bottle of water and a tumbler.'

'And,' said she, 'Uncle George must be Chairman of Committee, and you must be Secretary.—Dear Uncle George! I should like to see him ruling the Committee with his gentle rod. He wouldn't say "Bo!" to the greatest goose or bore, for fear of hurting his feelings.'

'And what shall Mr Raynor and Alexander be?' asked Ainsworth.

'My father,' said Isabel with sudden seriousness, 'and Mr Doughty must be left out of this: I have other things in contemplation for them.'

Thus they talked and walked; and before they were quite aware, they were back again at the gate of the lodgings. Ainsworth refused to go in, but he lingered over his adieu to Isabel.

'I suppose,' said he, 'this is the last time I shall see you here. When you return to London, it will be to the luxurious flat and the splendid dresses; though I shall think of you,' said he with an instant's abandonment, 'as in these lodgings and in the dresses I know. I have behaved brutally to-night!' he exclaimed in a tremulous tone that startled, and moved her. 'I have been very ungenerous! Forgive me!'

'Oh, no; don't say that!' said she, scarcely knowing what she said, but impulsively giving him her hand again.

'God bless you!' said he. He pressed her hand, and was gone with a lump in his throat.

And she thought that his feeling was only the tenderest friendship, and he thought that hers was pleasant preoccupation with the change in her affairs!

SOME FACTS ABOUT MARINE SURVEYING.

THE stranding of the battle-ship *Howe*, and subsequent court-martial on the Admiral commanding the Channel Squadron, has directed public attention in this country to the inaccuracy of the Spanish charts. This discovery not unnaturally led to a good deal of ignorant criticism of the Hydrographic Department of our own Admiralty, which in some quarters has been unduly censured for issuing those charts for the guidance of our own navigators. How far the department deserves blame in this matter need not here be discussed; but in view of the desirability of the vote for the Hydrographic Department being materially increased, it may be interesting briefly to describe the extent of the work carried out by our naval surveyors, and to give, from personal experience, some particulars of the mode in which a Marine Survey is conducted.

The whole of the charts of British territory, including of course our colonial possessions, are compiled by a handful of naval officers attached to the Hydrographic Department as volunteers. These officers—only fifty-three in number—are bona-fide naval officers, who have adopted this particular branch of the service, and who for the most part join it after attaining the rank of Lieutenant. The elements of marine surveying are now taught at the Royal Naval College, Greenwich, through which every executive officer is required to pass before he is granted the rank of Sub-lieutenant; but it is not until after an officer actually joins the surveying service that he usually acquires any practical knowledge of the work, and the Commander of a surveying ship is required to train his junior officers personally. As regards the area that has to be surveyed by our Hydrographic Department, it is noteworthy that although nearly the whole of the coast-line of the civilised world has been at least partially examined, either by British or foreign surveyors, yet the enormous increase of sea-traffic renders it essential to re-survey every coast and harbour frequented by shipping; and consequently, the work is practically endless. A large portion of the Mediterranean has from time to time been surveyed by British vessels; the charts of the Red Sea are also English; and for the past twenty years one or more of our few surveying ships have been constantly employed on the coasts of China and Japan.

The eight surveying ships now in commission are distributed as follows: Three are constantly engaged, except in the winter, on the examination of the coasts and harbours of the British Isles; two are on the China coast; two in Australian waters; and one in the Mediterranean. There are also a few small-hired vessels engaged in the survey of India and of the Newfoundland coast; but the deficiency of officers renders it absolutely impossible to maintain surveying ships elsewhere, and this is one of the points to which the attention

of Parliament is likely to be drawn at an early date.

Turning from generalities to particulars, it will be readily understood that the interest in a marine survey is usually greater when the area to be examined is new ground. There are still hundreds of miles of coast-line practically unsurveyed, or where the coast has been merely sketched in roughly. A vessel despatched to any of those districts has plenty of hard, but exceedingly interesting work before her. In such circumstances the first thing to be done is to ascertain the exact geographical position of the starting-point of the proposed survey, and this is usually accomplished by means of very careful observations, taken by practised officers. Observations of the sun are useless for this purpose, owing to the unavoidable errors of refraction, so that the position is invariably fixed by the stars. These observations are taken at a selected point on shore by means of an artificial horizon—that is, a small tank of mercury. Meanwhile, a base-line is carefully measured, one end of which is ultimately fixed—that is, its exact position is ascertained—by the star observations. The direction of this base-line, and its exact length, being also determined, the surveyor is thus enabled to draw a line on his blank chart, and from this single line the whole survey of the coast can be continued by triangulation. But the accuracy of the triangulation depends from first to last upon the measurement of the original base-line, so that the greatest care is necessary at the outset. After the triangulation has progressed to a small extent, errors can readily be discovered. Without going too much into details, it may be explained that triangulation is effected by means of the theodolite, a mathematical instrument by which vertical and horizontal angles can be taken with great nicety, and the use of which is easily learned. The same kind of instrument is used by land-surveyors; and for the Ordnance Survey of Great Britain one or two of unusual dimensions were constructed.

But to resume. For coast purposes a network of triangles is connected by means of these theodolite angles, and the positions of all prominent mountains visible from the sea are carefully set down. In some cases it may be necessary to send an officer and a party of men some miles inland for the purpose, and a difficult ascent may have to be made, as it is essential that the angles should be taken from the summit of the mountain. Sometimes on a clear day all the angles can be obtained in a few hours; but unless the atmosphere is clear, the party has to camp on the hill, and there remain until peaks farther up the coast come into view. The sailors, as a rule, greatly enjoy those tenting parties, and welcome such breaks in the monotony of a coast survey, and it is at such times that the ubiquitous character of the British seaman may best be studied. The men drag a tent up the mountain-side and pitch it somewhere near the summit, for the convenience of the officer in charge. They also have to take the necessary provisions, and sometimes fresh water in addition. Meanwhile, if there is any prospect of delay, the ship proceeds farther up the coast and lands similar small parties at other points. I thus spent a week on one occasion on a small barren rock on

the coast of China, together with four seamen and a marine servant; and our small stock of water was nearly exhausted before the ship was able to return to take us off. That, however, was regarded as quite an ordinary incident of a marine survey. On another occasion, a brother-surveyor, who was also landed on a small rock off the coast, had the unpleasant experience of being made a target of by a passing man-of-war. Needless to say the captain of the ship had no notion that the desolate-looking rock was temporarily occupied; but for an hour or more my friend and his men were in great peril, and only escaped destruction by crouching on the farther side of the rock while the shot and shell crashed against the diminutive island. Ultimately, the ship proceeded on her way without a soul on board having observed the angry and terrified surveyors.

The actual sounding is perhaps the most important work of the marine surveyor, although, as I have endeavoured to explain, this cannot be begun until after a variety of 'stations' on the coast have been fixed on the chart. The reason is this: the position of every sounding has to be accurately ascertained, and this can only be done by means of sextant angles. Thus, suppose the surveying ship to be running lines of soundings off some previously unsurveyed coast. She is running, perhaps, from a point above five miles seaward directly towards the land. The lead is dropped from the bows, and simultaneously two officers take angles to fix the ship's exact position. The bearings are laid off by means of an instrument termed the 'Station Pointer,' and at the point indicated the sounding is at once 'plotted' on the sheet. This process is repeated at short intervals; but it is not necessary to observe angles at every cast of the lead, as the vessel is kept on a straight course, and the speed being known, the soundings are divided between the points thus fixed every few minutes. These angles with the sextants, it will be understood, are taken between the hills or other prominent objects on shore, previously fixed by triangulation. When the soundings are regular, and shoal gradually as the coast is approached, it may usually be assumed that no hidden rocks lie in the immediate vicinity: but should the lead betray a sudden decrease of depth, the position of the ship is promptly ascertained, and a thorough examination of the neighbourhood has subsequently to be made. Pinnacle rocks are the most dangerous to navigation, and by far the most difficult to discover; but, strangely enough, a surveying ship is very rarely injured, as the constant use of the lead usually indicates a danger in sufficient time to avert disaster.

In a somewhat similar manner the inshore soundings are taken in the ship's boats. Here the work is necessarily carried out under greater difficulties, but the process of fixing the positions of the soundings is identical. Both ships and boats run parallel lines of soundings, the intervals between which have to be regulated according to the nature of the bottom and the anticipation of probable dangers. The boats can of course approach suspected rocks without risk; but as the ship cannot do this, she is principally employed when sufficient depth of water may reasonably be looked for. It is a fact insufficiently appreci-

ated even by nautical men that a marine chart, however carefully compiled, does not profess to indicate every hidden danger that may exist. There are necessarily intervals between the lines of soundings which cannot be examined, and it is only in frequented harbours that the marine surveyor is usually able to make so complete an examination as to justify the absolute confidence of the navigator in its accuracy. All coast charts have therefore to be used with discretion and with due regard to the possibility, not of actual errors, perhaps, but of errors of omission. Unfortunately, as I have said, this fact is insufficiently appreciated, and this is one of the reasons why ships are constantly wrecked even in the trade-routes of the world. I must not omit to mention the fact that the accuracy of the soundings is determined by careful tidal observations. To this end, tide-poles are erected whilst the sounding is in progress, and the rise and fall is noted for several weeks. The rise and fall is thus calculated; and, as a precautionary measure, the soundings set down on our charts indicate the least depth that will be found at any time—that is, at low-water ordinary spring-tides.

The actual production of the chart is an equally interesting process, which I have no space to describe in detail, and which taxes the accuracy of the surveyor to the full. The preliminary work, as may have been gathered from the above particulars, is executed on the officers' 'field-boards.' From thence, the soundings, &c., are transferred to a large sheet, kept in the chart-room; and from this plan, a fair sheet is ultimately drawn. The fair sheet is sent home to the Hydrographic Office in an air-tight tin case, and from it the Admiralty engravers produce the published charts, which are sold to the public at an absurdly small cost.

THE SACRED BEETLE.*

By LAMONT GREME.

IN FOUR CHAPTERS.—CHAP. I.

SOME years ago—a good many—I was putting up at Shephard's Hotel in Cairo. This place is a veritable caravanserai of travellers. Men and women of all ranks, classes, and nationalities then frequented it, and I reckon they continue to do so to this day. The babel of tongues, the many various languages constantly striking on one's ear, would have been, perhaps, tiresome and wearying to most men; but to a hardened old rolling-stone of a bachelor like myself the admixture was profoundly interesting. Most of the languages spoken were familiar to me; and I derived great interest from studying the different representatives of nations who made Shephard's Hotel a halting-place for a short or prolonged space of time, as the case might be.

One naturally gravitates in such a crowd towards one or two men who seem of a congenial spirit. Such a one I discovered in an American—a Colonel Merritt. Tall, well built, and a thorough gentleman, he attracted my attention almost immediately; a few casual words led to our monopolising a little marble-topped table to ourselves for after-dinner coffee and cigarettes; and our conse-

* The Right of Dramatisation reserved.

quent talk cemented a friendship which I hope to improve later on in the Colonel's own country. Every night we would sit out under the stars smoking and chatting; and at length, after some three weeks of acquaintanceship, the Colonel related the tale to me which I propose to lay before my readers. But as he told it in rather a disjointed fashion, beginning where the adventure concerned himself, then passing on to its termination, and finally winding up with what should have been the prologue, I have ventured to take upon myself to put it 'ship-shape,' or, as children always ask one to do, 'to begin at the beginning.'

It is needless to remark, after this preamble, that the story in itself is not my own: it is Colonel Merritt's. But the shaping and fashioning of it are mine, and therefore any faultiness in the construction and retailing thereof must be laid to my charge. It is a very strange experience for this nineteenth century—for the end of it—although Edison and others have so familiarised us with marvels that we should not pose as bigoted unbelievers in any tale, however astounding it may appear to our ordinary everyday senses. Rather should we exclaim with Hamlet that 'there are more things,' &c., and wonder, more especially when we remember that Egypt was the birthplace—at least I believe so—of very extraordinary things in the way of magic and science. Be that as it may, this story is one of the strangest I ever came across, and as such I deliver it over to my readers, premising only that it is perfectly true—according to the Colonel's word of honour—and that the reason it was not more universally known is that the actors therein were too ashamed of the parts they played, or were made to play, to say anything about it publicly.

These few remarks concluded, I will proceed with the tale of 'The Sacred Beetle.'

The clocks were chiming midnight from the various church towers of the ancient university town of Böllingen. After a few moments' pause, the bells of all the sacred edifices in the city broke out into a simultaneous clash and clang. It was the 31st of December 187, and they were bidding adieu to the old year and welcoming in the new. The night was calm and clear, but bitterly cold; and the moon poured floods of silvered light over the snow-clad roofs and streets, rendering the latter as clear as day, and intensifying, by comparison, the shadows of the buildings and trees which stretched themselves in flat black patches over the whitened ground. The stars twinkled brightly in the frosty air, and the voices of those who were hardy and bold enough to venture out to the midnight services rang sharply and distinctly through the keen atmosphere.

Dr Carl von Eberstein sat alone in his study on the second floor of the house wherein he lodged, poring intently over an ancient-looking, yellow scrap of parchment scrawled over with numerous symbols and—seemingly—algebraical signs, while by his side and on the floor lay scattered a number of loose sheets of paper covered with calculations and writing. As the sound of the chiming bells struck on his ear, he raised his head as though to listen, and then, pushing his documents from him, he rose, and,

drawing aside the curtains, gazed out into the starlit night. He was a man of about thirty-five, tall and well built, with fair hair, beard and moustaches, a handsome, though slightly wearied-looking face, and clear blue eyes. A very favourable specimen of the German type, and good to look upon.

'Ay! ring on,' he muttered as the bells leaped and jangled in their delight that a new year was born—'ring on! Do ye triumph in that I have discovered some grand old mystery of science, perchance, or do ye mock at me and my endeavours? Nay; let me rather assume the former;' and flinging open the window, he leaned his elbows on the sill and allowed the pure air to play about his throbbing temples. The bells were silent now, and the little retired street in which he lived lay sunk in repose. Presently he heard cheerful accents approaching, and then a clear tenor broke out into a song, the words and tune of which were at once caught up by eight or ten other men's voices, and the refrain rang out melodiously on the night:

We love the Moon, the merry Moon,
We love the merry Moon;
We greet her smile in winter;
And we laugh with her in June;
The sun's broad face may bear the trace
Of mirthsome mood and jest,
But oh! the Moon, the merry Moon,
We love the Moon the best.

By this time the student choristers had arrived beneath the Doctor's open window, and, glancing up, espied him leaning out.

'Good-evening, Professor,' they shouted. 'Are you bidding a tender farewell to another departed year?'

'Ay, ay, my lads,' responded Dr Carl, 'although after a somewhat different fashion from yourselves.—But good-night—good-night; it's time for bed.'

'Schlafen sie wohl,' was the reply, and with this cheery wish and a unanimous 'Happy New Year to you!' the little party moved on homewards, breaking out again, as they went, into their song:

The little stars peep out, peep out,
The little stars peep out,
And shudder into shade again
To hear our merry shout;
So let them shrink and nod and blink,
And blush at joke and jest,
But oh! the Moon, the merry Moon,
We love the Moon the best.

The chorus died away gradually, fainter and fainter as it receded, into the distance; and the Professor leaned thoughtfully against the side of his open window, listening to the melody as it came floating back to him in scarcely audible harmonies. Then he carefully closed the sash, drew the curtains, and strolled over to the fireplace, where he stood chafing his hands before the welcome blaze.

'Happy youth!' he murmured. 'What do they care about the future? No serious reflections, no weighty problems, trouble their light hearts. How they would laugh did they but get an inkling of the work their sober Professor of Oriental Languages has been this night engaged in. Well—let me see the result of my labours again, and make certain that there is no

mistake. Who would have thought that I should have discovered this old manuscript while unrolling that mummy some days ago! And still less, who would have dreamed of the tremendous secret therein contained! And yet it is not all unravelled; the mystery is not yet clear; let me see again.' And taking the parchment and a sheet of paper with writing on it from his table, he drew a chair close to the fire and commenced comparing the two documents. After half an hour's careful study, he raised his head. 'Yes, the translation of the cipher seems correct. How does it sound?' And he read off in slow, distinct accents the following:

'Stranger, whosoever you may be into whose hands these words may fall, know that I was the Priest Amunophis of the holy temple of Osiris. Owing to my skill in and aptitude for the various sciences and magical mysteries of our craft, I was admitted by our high-priest to his sole intimacy. From him and with him I learned much mystical lore, but in so doing I lost health and character—the former owing to my excessive toil and zeal; and the latter to the unholy reputation of wizard, which clung to me. Shortly before his death, the high-priest summoned me to his private chamber, and there exhibited to me, in great secrecy, a small, perfectly-formed, bronze beetle—a "scarab." "This," said he, "you must enfold carefully in prepared linen, and deposit on my bosom when I am embalmed and laid in my tomb. Its virtues are so potent and so dangerous, that I have determined none shall possess it, and I am forbidden to destroy it, now that it is fashioned. Swear to perform my bidding." I swore; and at his death I fulfilled my oath. Being now myself about to die, I have enjoined that this scroll should be wrapped with me in my shroud; and if it be the will of the gods, the Sacred Beetle shall, through my means, emerge from its obscure resting-place and complete its destined task, though what powers may be attributed to it I know not. If, therefore, thou fearest not, proceed to Phih, and seek along the river for the Temple of Abou-Symbel, which is dedicated to the worship of Osiris. In the innermost chamber are four figures, seated each on a throne. Under the feet of the second figure from the right as you behold them is situated the tomb of the high-priest Menhartis. It lies at the bottom of a deep pit, in a rock-hewn cavity wherein are three sarcophagi. The one in the farthest corner from the entrance is that of the high-priest. Remove the cover; unroll the mummy; and on its breast, folded in many wrappings, will be found the object of your search—the Sacred Beetle. Appropriate it, oh venture—some one! and test its powers, be they for good or ill; and blame not me, but thine own foolhardy inquisitiveness, should the result prove the latter. Farewell.'

The Professor ceased, and an expression of deep gravity overspread his features. 'Shall I take the matter in hand?' he soliloquised. 'If I do, I will carry the adventure through to the end be the issue what it may.—But pshaw! Am I to believe in talismans with magical properties in this nineteenth century? And yet'—Here he fell to musing again. Presently he rose, filled his pipe, fetched his Bradshaw and an atlas, and

began to map out the journey. His cogitations and his pipe were finished at the same moment. His face lightened. 'I can have a six months' holiday,' he exclaimed briskly, 'and I will take it. I will start at the earliest possible date, and I will get to the bottom of this affair; and if there be any elucidation of the mystery, I will fathom it. And now to bed.'

So saying, he carefully locked up his precious manuscript and its translation, and retired to his couch to dream, disturbed by visions of tombs, and Pharaohs, and magical scarabs, all of which played havoc with his bewildered brain.

HINTS FOR HOUSEKEEPERS.

It may not be generally known that tough meat can be made tender by laying it a few minutes in vinegar. Remember not to salt fresh meat when frying until it is nearly cooked, as salting makes the juice of the meat run out, and the meat is not so tender. The general rule for roasting is to allow fifteen minutes to a pound, provided the fire be good, and ten or twenty minutes over, according as the family like it well done or not. Perhaps few people think how much better a leg of mutton looks if boiled in a coarse muslin cloth or white netting.

Does every housewife recollect how to remove the strong flavour of poultry? The fowl should be washed in soda-water, rinsed in cold water, and wiped dry.

How many housekeepers are competent judges of fresh eggs or fish? In judging the former, you should notice that a fresh egg has a lime-like surface; stale eggs are glossy and smooth of shell. Firmness of the flesh and clearness of the eyes are the great criteria of any fish being fresh and good. Fresh fish also lie in a slightly curved position, and never quite straight. Herrings and cod are known by the redness of their gills and clearness of the eyes. It is worth recollecting that salt fish is best and quickest freshened by soaking in sour milk; and that all fried fish should be dried in sheets of paper in front of the fire.

Lobsters, crabs, and crayfish, when recently caught, always retain some remains of muscular action in the claws, which may be excited by pressing the eyes with the fingers. Shrimps are firm and crisp when fresh. If oysters are fresh, the shells are firmly closed. Speaking of shell-fish, it may here be mentioned that the Consultation Committee of Fisheries in France came to the conclusion that the poisonous action of mussels is due to the presence of a particular microbe occurring only in mussels that have lived in stagnant waters. It is more assuring to learn that such mussels are deprived of their poisonous property by the addition of sodium carbonate to the water in which they are boiled—a simple precaution which might well be taken by every consumer of these fish.

Some people are not always careful to drain the water from vegetables as soon as they are cooked. Others do not know that potatoes should never be put on a table in a covered dish; they will re-absorb their own moisture and become sodden. Before attempting to chop parsley, wash it and squeeze it very dry in a clean cloth. It is also well to know that if you rub the hands on celery after using onions, the smell will disappear.

The medicinal properties of vegetables are not always appreciated. Celery is good for nervousness, rheumatism, and neuralgia. Lettuce is cooling and sleep-producing; and asparagus purifies the blood. Tomatoes act on the liver, while beets and turnips are excellent appetisers. Potatoes should be avoided by those inclined to be stout; but peas, broad-beans, and haricots are positively strengthening. Onions, garlic, leeks, olives, and shallots all possess medicinal virtues of a marked character; while onions eaten raw are recommended as a remedy for insomnia. Soup made of onions, being a tonic and nutritious, is regarded by the French as an excellent restorative for debility of the digestive organs.

Apples are also said to possess great medicinal value, especially for persons of sedentary habits. Apples and pears cut into quarters, stripped of the rind, baked with a little water and sugar, and eaten with boiled rice, are capital food for children. Another hint worth noting is to scald rhubarb before cooking it. It then takes much less sugar, and yet loses none of its acid. Orange-peel dried and grated makes a fine yellow powder that is delicious for flavouring cakes and puddings. It will also be found that apple and pear pips when bruised impart an excellent flavour to milk-puddings. Not a bad substitute for eggs in cooking is corn-starch. In short, it may be remarked that one of the great weaknesses of cooks in this country seems to be their contempt for economising in any way. They appear to fail to realise that it is better to begin life on Indian-meal pudding and salt cod-fish, and rise to roast beef and mince-pie, than to begin on roast beef and mince-pie, and get down to Indian-meal pudding and salt cod-fish.

It is advisable in cold weather that we should eat heartily of substantial food and drink milk and cocoa. Before boiling milk, rinse the saucepan out with cold water, to prevent burning. To keep milk sweet or to sweeten sour milk, put into it a pinch of carbonate of soda. Useful, too, is the knowledge that a pinch of salt added to a glass of milk renders it digestible to most persons; but salt should never be added to new milk when cooking, as it will cause it to curdle. Unfortunately, it must be admitted that the spread of infectious diseases through the agency of milk constitutes one of the dangers of the day. It has been noticed how the consumers of boiled milk, as a rule, escape any ill effects. In short, boiled milk may be said, for practical purposes, to secure immunity from infection by its means. The prudent housekeeper will therefore consume only boiled milk.

Not everybody knows how to preserve drawn beer. Cover over the vessel containing it with a saucer or plate. Place a couple of raisins, a little sugar, or a few grains of rice, into it. This generates the desired effervescence. Vinegar or yeast should never be kept in stone jars; the acids contained in them attack the glazing, and this is often poisonous.

Great improvement will be found in tea and coffee if they are kept in glass fruit-jars instead of tin boxes. The flavour of this favourite beverage is easily spoiled by the vicinity of any articles of pronounced odour, such as cheese, bacon, &c. How many people know how to make tea on scientific principles? Immediately that the water

boils it should be poured on the tea. Experience tells us that six minutes is best for the process of drawing, to bring out the proper quality, flavour, and strength. It is a mistake to neglect thoroughly heating the teapot before the tea is put in it.

If you rub the tea-kettle with kerosene and polish with a soft dry piece of cloth, it will appear as bright as new. Tea-stains may be removed by pouring boiling water through them. But never let boiling water touch japanned tea-trays, because it will cause the varnish to crack and peel off. Have a sponge, wet it with warm water and a little soap, rub with a cloth, and polish with a dust of flour and a wash-leather. If there are any marks, rub them with sweet-oil till they disappear.

Tea is recommended for washing grained wood. Stains on cups and saucers can be removed by scouring with powder, bath-brick, and soap. Save some tea-leaves for a few days to use for varnished paints; steep them in a tin pail for half an hour; strain through a sieve, and use the tea for cleaning the paint, which will look almost new. It will not wash unvarnished paint. A little ammonia in the water reduces the labour of cleaning soiled paint, while white and pale shades of paint may be beautifully cleaned by using whiting in the water.

If you wish to observe method in the house in winter, get your work forward by daylight, to prevent running about at night with candles. Thus you escape grease-spots and risks of fire. By the way, candles should be bought in winter. They are better when made at this season, and if stored in a cool dry place, will improve with age.

When house-cleaning, it is wise to begin at the cellar, and to give more thought to the condition of things in that region than to the drapery of the parlour windows or the ruffled pillow-shams in the 'spare room.' It may not be generally known that masons' dust from stone-sawing makes a perfect substance for scrubbing floors and plain deal tables, rendering them beautifully white. Tiled floors should be washed with lukewarm water and soap, dried with a soft cloth, and then rubbed over with a little linseed oil on an old silk handkerchief, and polished. Oil-cloths should never be washed with soap suds, but washed first in cold water, then rubbed dry with a wet cloth.

In cleaning carpets, go over them once a week with a broom dipped in hot water, to which a little turpentine has been added. If soot falls on the carpet, do not attempt to sweep it, or the result will be an ineradicable smear. Dry some salt thoroughly in the oven, sprinkle it over the soot, then sweep, and no trace of the soot will remain.

To clean paper hangings, first blow off the dust with the bellows. Divide a loaf a week old into eight parts. Take the crust in your hand, and, beginning at the top of the paper, wipe it downwards in the lightest manner possible with the crumb. Those disfiguring oily marks where people have rested their heads may be removed from the paper on walls by mixing pipeclay with water to the consistency of cream, laying it on the spot, and letting it remain till next day, when it may easily be removed with a brush. In choosing dusters for your house-cleaning, you will find cheese-cloths are the best, especially

after they have once been washed. A cloth wet in hot vinegar will remove paint from window glass; and diluted spirit of salts will get rid of window-stains; nor must it be forgotten in cleaning that a rich gloss can be put on glass by rubbing it quickly with soft old newspapers or tissue-paper. It may here be remarked that the kitchen window is the best of all windows for plants; the steam from boilers and kettles keeps the air moist. Finger-marks may be removed from varnished furniture by the use of a little sweet oil upon a soft cloth. Kerosene will remove spots from furniture; and stains on marble will disappear before the application of paste made of chloride of lime and water, if rubbed into the parts stained and left to remain for six hours. It should then be washed off with soap and water.

Metal will not prove so troublesome to keep in order if we only go the right way about cleaning it. For example, salt of lemon juice will remove iron rust. Fine emery paper and sweet oil are all that are necessary to keep steel bright; while a cloth saturated in kerosene and dipped in whiting will be found best for cleaning tin-ware. Strong ammonia should be poured over old brass to clean it, then thoroughly scrub with a scrubbing-brush, and presently the brass will shine like new metal. Stair rods should be cleaned with a soft woollen cloth dipped in water, and then in finely sifted coal-ashes. Then rub them with a dry flannel until they shine and every particle of ash has disappeared.

To at once heat rooms and save coal, buy a fire-brick about two inches thick. When the coals are aglow, lay this flat brick on the top of the fire, when it becomes red hot, and throws the heat out into the room in a way that a fire without this simple device will not do. Should your house be afflicted with chimneys that smoke, it should be borne in mind that the best preventive to the nuisance is to open the windows of the room ten minutes before the fire is lit, and not simultaneously with the lighting, as is generally done.

Those other nuisances—vermin in a house—may be got rid of in various ways. A hedgehog in the kitchen will soon exterminate black beetles. An india-rubber plant is said to drive flies from an apartment. Chloride of lime about the fireplace, or a little Scotch snuff, will cause crickets to cease to chirp. A few drops of essential oil of lavender on cotton-wool quickly rids a bed of troublesome insects. Cayenne pepper sprinkled freely in the haunts of rats will make them leave the premises. Ants will not like powdered alum scattered on shelves, nor moths damp salt, if used in sweeping carpets. It is comforting to know that blankets and furs sprinkled with borax and done up air-tight, will keep free from moths.

When cleaning hair-brushes, use warm water and a little ammonia. When possible, dry in the hot sun. Take every opportunity of putting your sponges in sea-water, for nothing cleanses them as this does. When on the subject of sponges, we are reminded that satin may be cleaned by sponging lengthways—never across the width—with benzene, if greasy, or alcohol, or borax water. This will not be injured by direct contact with iron; press on the wrong side.

Stains of every description may be removed from silk, linen, or woollen stuffs. Mix a wine-

glassful of rectified spirits of turpentine with half a teaspoonful of essential oil of lemons, and preserve the mixture in a well-stopped bottle. Apply a little on the stain with a bit of silk. The colours of the fabric will sustain no injury from the application.

Don't despair of being able to restore scorched linen, but peel and slice two onions, and extract the juice by squeezing or pounding. Cut up half an ounce of white soap, and add two ounces of fuller's-earth; mix with them the onion juice and half a pint of vinegar. Boil the composition well, and spread it when cool over the scorched part of the linen, leaving it to dry thereon. Afterwards wash out the linen.

Kid-shoes may be kept soft by rubbing them over once a week with pure glycerine and castor oil; and the leather of shoes and boots can be softened if washed monthly in soft warm water and then oiled thoroughly. They may be rendered permanently waterproof by soaking them for several hours in thick soap-water. If you wish to have dry boots, observe the American plan of filling them, when taken off at night-time, with hot oats, the best grain for the purpose. They do not injure the leather, and preserve the shape of the boots.

The neglect of many of these seemingly little things such as are here hinted at, but which are so important to the well-being of a household, frequently may arise less from disinclination to take trouble, than from ignorance, or forgetfulness of the remedies to be employed.

THE HILL OF SEVEN TREES.

By REGINALD HORSLEY.

You know that long blue hill which one can see from Toogong on a clear day? I mean the one on the top of which grows an irregular circle of six tall iron-barks, with a dead one in the centre. 'Gum Tree Hill,' it is usually called for short; but the literal translation of the native name is 'The Hill of Seven Trees.' Well, that hill was the scene of an adventure, which, though it ended agreeably enough, yet began in a fashion which threatened a very different termination; and indeed, if it had not been for what Foster is fond of calling my phenomenal luck, and the fact that I have apparently as many lives as a cat, I should probably not be here to-day to tell the story.

I was out after a gang of desperadoes so ruffianly that their deeds threw all previous bush horrors into the shade. They were known from the name of their leader as 'The Flower Boys,' and as a gang their career had been remarkably successful, though, individually, of course they suffered from time to time. Eight of them still remained at large, and they kept the country side pretty lively, carrying out their plans in so clever a manner that it was almost impossible to trace them, much less run them to earth. What became of all the money and valuables they secured, or how they got rid of them, is hard to say. No doubt, many of the small settlers of the baser sort were in their pay, and vast sums must have been expended in keeping shut the mouths of these gentry. But we were certain that, notwithstanding this, a big pile

must be stowed away somewhere; and at mess, or round the camp fire, we often speculated as to who the lucky man would be to discover the hoard.

One blazing hot February the gang came down in force upon a pack of fools who had been lucky at Tambaroora, and, disclaiming the services of the escort, started to take their dust down to Sydney on their own account. Things leak out at the diggings, and no doubt some of the 'Flower Boys' were on the prowl for news. At any rate, on the second night of their journey the 'lucky five,' as they were called, were bailed up, and making some resistance, were shot down and all their gold stolen. It was a few days before the matter came to light, and then, with four picked men, I set to work to scour the country for Flower and his gang, for it was pretty certain they were at the bottom of the outrage.

We had been out about a week, with never a hint of the men we were after, when one day, as we were riding rather aimlessly over a long flat, Foster, who was on the right, brought up his horse with a sudden jerk and sprang to the ground with a sharp exclamation.

'What is it, Tom?' I called out.

He stooped to pick up something, and then ran towards me. 'Look, sergeant,' he said excitedly. 'What do you make of this?'

'What?' I asked, leaning over my horse's neck as he came up. Foster held up a small nugget of pure gold.

'Nuggets don't grow on this kind of soil,' said he.

'No; and diggers don't come this way down to Sydney,' put in Longmore.

'What do you suppose it means, sergeant?' queried Foster.

I did not answer him, and the men fell to discussing the matter among themselves. Indeed, I had scarcely heard Foster's question, for the moment I saw the nugget in his hand an idea had taken strong hold of me, and I sat silently on my horse, working it out, with my eyes fixed upon the distant Hill of Seven Trees.

'Boys,' I said at last, rousing myself from my meditations, 'I've a notion this bit of gold means a good deal to us. There is nothing to stick up in this direction; so, if Flower and his gang have passed over this ground—and we will assume they have—there is every likelihood that the nugget has been dropped by one of them on the way to their lair, wherever that may be.'

'I wish I knew,' interrupted Peterson fervently.

'Well,' I went on, 'if we have decent luck, you will know before to-morrow morning.'

'How?' 'Why?' 'What do you mean?' cried the men.

'Look!' I answered, pointing to the hill, from the summit of which curled upwards a thin, very thin column of smoke, so faint as to be almost invisible in the shimmering distance.

'Bush-fire beginning,' said Longmore.

'It may be so,' I acquiesced; 'but remember, this is an out-of-the-way place, and that smoke may have another origin.'

'Flower is too good a bushman to light a fire where it could be seen,' argued Foster.

'Hope for the best,' I returned. 'At all events, it can do no harm to reconnoitre. We are much too far off to have been observed, so

we will dismount for the present, hobble the horses, and remain where we are till nightfall, when we will go forward and examine the hill.'

The afternoon wore on, and by five o'clock the column of smoke was no longer to be seen.

'What about a bush-fire now?' I asked.

'Well,' said Foster, 'probably it was a "sundowner's" fire. Flower is a bigger fool than I take him to be if he lit it.'

As the sun sank behind the ranges, we jumped into our saddles again, and in a couple of hours reached the base of the hill, which, as you may know, juts out in a very peculiar fashion from the range of which it forms part, showing a bold, precipitous front to the east, and sloping away in a long ridge, or neck, to the hills behind it.

'It is useless to attempt to scale that, lads,' I said, looking up at the rugged face of the cliff that towered above us. 'We must work round and climb up the neck.—Vincent, you stay here by the horses, and keep your eyes open and your six-shooter handy. The rest of you come with me.' And with a parting word to him, we plunged into the darkness and made for the ridge on the right side of the hill. Once round the face of the cliff, the ascent was fairly easy over the stone-strewn ridges, and in no very long time we stood upon the summit of the spur, nearly half a mile from the front of the hill. Then I called a whispered halt, and gathered my men round me.

'Now, lads,' I said, 'we must search this hill thoroughly. Go slow, for we have plenty of time before us, and the work must be well done. Spread out in a long line, and examine every inch of the ground. If one of you should discover anything he thinks I ought to know, let him hoot thrice like the mopoke, and I'll join him. The same cry thrice repeated will be the signal for the rest to come up. If nothing comes of it all, we'll rendezvous at this point at sunrise. Be very careful. The moon will soon be up, and then you must take advantage of whatever cover you can find. Above all, don't hurry.—To your places.'

We started in an extended line, like skirmishers, Foster on the extreme left, Peterson next, then myself, while Longmore took up his position on the right.

For some time we worked on without result, and not a sound broke the stillness of the night. Then, suddenly, from the left came the mournful notes of the mopoke, thrice repeated.

'Confound it!' I thought. 'I wish the signal had come from the other side. One can never trust Tom Foster except in a fight.'

However, there was no help for it, and I turned and made my way in the direction of the sound, wondering what mare's-nest Foster had discovered, and grumbling generally, when all at once the ground seemed to glide from under me, and the next moment I felt myself falling, falling, falling, through what seemed in the pitchy darkness an infinity of space. Instantly the horrifying thought shot through my brain, 'I have gone over the edge of the cliff;' and then I plunged violently into a thick shrub, rolled out of it, and was off again, crashing through bushes and saplings, grasping wildly right and left, and clutching madly at whatever came in my way, till at length my headlong course was arrested by some hard

object, against which I came sideways with a fearful thump, which nearly knocked all the remaining breath out of my body. Then, as I felt myself slipping away again, I made a desperate effort to recover myself, and flung my arms round the opportune obstacle which had arrested my fall, while at the same moment a large piece of rock, dislodged by my struggles, went whirling into the air, struck a ledge immediately below, rebounded off, and thundered down the side of the steep, while I hung on to my friendly support with a tenacity born more of terror than of necessity. But there is some excuse for a man who has fallen I don't know how many feet through space, and then rolled I don't know how many more down a rough mountain side.

Presently, however, I began to collect my scattered senses, and then I saw that I was clinging to the trunk of a sassafras tree, which grew out and made a convenient angle, into which I had fallen, and but for which I should doubtless have gone the way of the rock. While my arms clung to the tree, my body lay stretched on a small projecting ledge, so that I soon realised that all danger was over for the time being, and, loosening my grip of the tree, felt myself all over, and stretched my legs to see if any bones were broken. No. I was badly bruised and shaken, but otherwise quite unhurt, and I took a fresh grip of the tree, intending to haul myself up into a more comfortable position, when in an instant I stiffened into immobility, and lay as still as a snake in the sand, my face buried in my arms, lest the sound of my breathing should betray me. And this was the reason. Immediately below me I heard rough voices conversing together in low tones, and evidently not more than a few feet away.

For a moment I lay and listened, as from beneath came up a muttered conversation.

'Wot d'yer reckon it wuz, Bill? Wallaby?'

'Wallaby be blowed!' answered Bill. 'It was a great junk of rock. I see it strike the ledge 'ere and go over. It just missed my head.'

'I wish it had been one of them troopers,' said a third voice with heartfelt emphasis.

A fourth voice added a word or two which I failed to catch, and then the first speaker exclaimed with a fierce oath: 'Well, it's all right, anyway. Whatever it was, hez gone to the bottom long ago. I'm going to turn in again.'

Then for a moment there was a shuffling of feet, and afterwards silence, profound and enduring.

I lay as quiet as a mouse, my eyes fixed upon a silver streak that touched a low bank of clouds somewhere in the sky. The moon was rising, and when once she was up, I should know better what to do.

Just then a spasm of dismay seized me. Foster, having given the signal, would naturally be waiting for me. What if, finding I did not join him, he should coo-ee! He was ass enough to do it; and if he did, good-bye to all chance of coming unawares upon my game below. It was scarcely likely my men had not noticed the noise I made in falling, but I could only hope the same idea had occurred to them as to the fellows underneath—namely, that a rock had been dislodged from its bed. I felt thankful I had not cried out as I fell. Profound stillness reigned, however, and I concluded that either Foster was showing

a most unusual discretion, or that he had fallen in with Longmore or Peterson, both of whom knew better than to give any indication of their whereabouts.

A quarter of an hour passed, and the silver fringe on the cloud-bank grew more intensely brilliant, and at last a magnificent full-orbed moon sailed majestically into the sky, shining with such radiance that one might have supposed it to be day. I gazed about me in astonishment. From the ledge on which I lay I could see that I had fallen down one side of a great chasm, a hundred feet wide, which apparently clove the Hill of Seven Trees in two.

Having taken a broad survey of my position, I began to examine the immediate vicinity. I found that I lay on a narrow out-jutting rock about six feet wide, down the sloping side of which I must inevitably have slidden had I not grasped the tree in time. Immediately below me was a ledge about fourteen feet long, and on this, I at once concluded, had stood the men whose voices I had heard. But where were they now? That was the puzzle. Just then, I heard a curious sound, and craned my neck over the rock as far as I could. But its surface slanted so peculiarly that still I could see nothing but the ledge. Again the sound was repeated—this time an unmistakable snore.

'Ah, there they are,' I said to myself; 'sleeping the sleep of the just.' But where? On the ledge, under the shelter of my rock? Or—ah! I had it. The truth flashed upon me in a moment. There was a cave or hole in the side of the gully, and they were in it. How could I get down to the ledge? I leaned over still farther. Yes, it could be done. It was only a drop of six feet or so, the tree grew out over the ledge, and if I swung on to that, my feet would almost touch the rock.

At that moment, while my head still hung over the edge of the rock, there was a sudden movement beneath me, and a burly ruffian stepped on to the platform and stood in the clear moonlight looking about him. I am used to surprises, and I kept quiet, though my heart thumped so violently against my ribs that it seemed to me he could not fail to hear it. However, he stood still and made no sign. So close was he that I could have knocked off his cap by stretching out my arm. Had he looked up, he must have seen me; but he did not, and as I lay breathless, motionless, rigid as the rock upon which I was stretched, I heard him soliloquise: 'What's the use of keeping this confounded watch? There's nobody round. I'm going to turn in like the rest of 'em.'

All the time I was rapidly forming a plan of action, while one hand stole silently to my hip, where my second revolver reposed in its case. My first had gone goodness knows where when I left the top of the hill behind me. Presently I had the weapon out, and extending my arm far over the edge of the rock, I held it within a foot of the bushranger's head. He yawned and turned in his tracks to go back to the hole, and, turning, looked straight down the gleaming barrel. It was all over in an indescribably short space of time. Astounded at the unexpected sight, and anticipating nothing less than instant death, the man stepped backwards mechanically.

One foot went over the ledge, and then, throwing up his arms, he fell with a shrill shriek into the gloomy depths below.

I had not anticipated so sudden and terrible a result, but I had no time to take in the horror of it all. The situation was instinct with danger, and I braced myself to face it. So thrusting my revolver into my belt, I grasped the tree, swung myself silently down, and drawing again, stood prepared for whatever might follow. I stood on the platform about two feet from the mouth of a great hole in the mountain side, into which I could not see for a wall of rock which projected between me and it. But as I stood, a voice came from within in sleepy tones: 'What's up, Bill? Another rock?'

I did not answer, and the voice continued: 'Bill! I say, Bill!' Judging it unsafe to keep silence any longer, I answered in a gruff whisper: 'Wot?'

'Did yer call?'

'No; it was a curlew.' And fortunately the weird wailing scream of that bird rang out on the air as I spoke.

'That's all right, then,' growled the voice, and silence fell once more.

I allowed a minute or two to elapse, and then wormed my way round the rock and looked upon a strange scene.

In front of me was a vast hole, one of those natural excavations so common in the mountains, a place altogether about the size of an ordinary room, with a wide floor, and a roof sloping away to a narrow angle at the back. On the floor was a fire of logs, which had recently been replenished, and no doubt the smoke issuing from this hole, unobserved by the ruffians, had been that seen by us in the afternoon. Two men lay on the ground, sleeping heavily and snoring loudly; while a third sat warming his hands over the blaze, his back turned to the entrance, and evidently quite unsuspecting.

I made up my mind at once, and strode into the cave without any attempt at concealment, for I felt that I had the game in my hands now. The fellow heard me coming, of course. 'Hullo, Bill!' he grunted without looking round. 'Had enough watching? I told yer there was nothing up. Hev a sup of this and turn in.' And he stretched out his hand to a bottle, to which he had evidently been paying close attention. 'Take a sup afore yer lie down,' he reiterated; and then, as he turned his head and saw me: 'Why, what the?— Here— wake up, Ned! Wake up, Chicken!' he cried, and springing to his feet, he plucked his revolver from his belt.

'Throw up your hands!' I shouted, covering him.

For answer he rushed at me, firing as he came. His bullet grazed my cheek, and I felt a sharp stinging pain, as if a red-hot wire had been drawn across it. In another moment we should have been in grips, when I pulled the trigger. The ball took him squarely between the eyes, and he fell in a heap at my feet. Not a second elapsed before I had my pistol pointed at the others.

'Throw up your hands!' I cried. 'Throw 'em up!' I repeated savagely, as one fellow's hand stole to his belt. 'Up with 'em, or I fire.'

They dared not resist, for I had the drop on them, and they knew it.

'Now, throw your barkers on the ground and stand up.' They did so. 'Now your knives. Right. Kick them over here.' And at last they stood there, as hangdog a couple of ruffians as you would wish to see, but defenceless.

'We're done this time, Chicken,' said Ned with an oath.

'Yes,' I said, 'you are; so you'd best be quiet. Are there any more of you about?'

'No,' growled the Chicken.

'Where's Flower, then?' I asked.

'Where you won't find him,' said Ned.

'You keep a civil tongue in your head,' I retorted.—'Ned, you pick up that bit of rope and tie the Chicken's hands behind his back, and if you don't get it done before I count ten, I'll blow your ugly head off.— Quick, now!'

With a savage snarl Ned obeyed; and as he tied the last knot, I slipped a pair of handcuffs over his wrists before he had time to realise what I was about, whipped a turn of the rope around his waist; and then, as the two of them broke into a torrent of fearful curses, I searched the cave thoroughly without finding anything for my pains.

'Shut up!' I said, taking the slack end of the rope in my hand. 'Keep your breath till you get to Sydney. You'll want it all then. And now, march!'

'Where to?' growled the front fellow.

'Down the gully. You lead me to the face of the hill.— And mark me, if you attempt to play any tricks, you'll get a mighty short shrift. On you go.'

They started in sullen silence, and once on the ledge outside, walked to the left, where, hidden in the shadow of the great boulder, was a narrow track.

'There ain't no way down as I knows on,' said the Chicken looking back.

'Then lead up to the top,' I answered, 'and we'll get down by the neck.'

They went on, forcing their way through the shrubs and undergrowth, and clambering over rocks and fallen trees with a good deal of difficulty in their helpless condition, while I followed behind like a slave-driver, only with something much more convincing than a whip in my hand. Just as we got to the top of the gully there was a sudden loud coo-ee close by.

'Foster at last,' I thought. 'Coo-ee!' I shouted in return, and then, 'Hurry up, boys! I've got 'em.'

There was a cry of astonishment, and my men came running up together, all pressing round to shake me by the hand.

'Well, I'm blowed!' said Foster. 'How did you manage it? We had given you up for lost, as, after we struck the edge of the gully, we all agreed you must have fallen over.'

'Well, and so I did,' I answered cheerfully; 'and that's the way I managed it.' And I told them my story.

'By gum!' said Foster again when I had finished, 'if your luck isn't phenomenal!'

'But, Tom,' I interrupted, 'what made you give the signal?'

'I heard something,' he replied; 'but it was only a rock wallaby on the go.'

'Ah! I thought as much,' said I, laughing. 'Well, I forgive you any way, for unless you had hooted, I might never have had that lucky tumble into the gully.'

'But did you find anything?' asked Longmore.

'Nothing,' I answered. 'I expect the hoard is somewhere else, and Flower and the others are alongside it.—Isn't that so, Chicken?'

But the Chicken preserved a disdainful silence.

As we were talking, we were standing within the circle of trees which gives the hill its name, and Peterson was leaning against the dead tree, standing on one of its giant roots. As he was filling his pipe, he dropped his pouch, and uttered an exclamation of surprise as he stooped to pick it up.

'What's wrong?' we all inquired.

'Why, here's another of them,' he answered, and held up a small nugget between his finger and thumb.

'Alia!' I said; 'we are on a hot scent, boys. Search among the roots.'

They did so without any result, while to all interrogation the two prisoners remained obstinately silent.

'The tree is hollow,' said Longmore at last; 'but there is no opening at the base. Perhaps higher up?'

'By Jove! you've struck it, Jack,' I cried. 'I wondered all along what they wanted with all that rope. However, put the bracelets on the Chicken, and let us have the line here.'

Foster very soon accomplished this, and with the rope in my hand I turned to Peterson. 'You are the lightest, Frank. Take a cast over the first fork and shin up.'

After a few unsuccessful attempts, we got the rope over the branch, and a slip-knot having been made, the loop was drawn taut. Peterson then took off his boots and swarmed up the rope, occasionally resting his feet against the trunk, in the native fashion, and presently he was in the fork.

'Here you are, sergeant,' he cried. 'There's no mistake about it this time.'

He was tugging away at something with all his might, and at last, from a wide hole in the straight trunk above his head, he wrenched out what looked like a bundle of old rags.

'Stand from under!' he shouted, and cast the thing at our feet, swinging himself to the ground a moment later. It was an old flannel shirt, tightly rolled up, and with the sleeves knotted round it for security. I untied them, and as the ends fell apart, the moonbeams poured a flood of radiance upon a great heap of nuggets and gold-dust.

'Hurrah!' shouted my men; while Peterson exclaimed: 'That's good enough for one haul, I should think.'

'Rather,' I said. 'There must be about a hundred ounces here.—But this can't be all: the "lucky five" had more than that by a good deal.'

'It's all you'll get,' put in Ned, with an oath. 'The rest of the swag is where you will never touch it.'

'We'll not take your word for that, my man,' I replied. Nor did we; but, all the same, the most thorough search by daylight discovered nothing more; and at last we gave it up, and

jogged off with our prisoners, well content with the result of our expedition so far as it went.

Ned and the Chicken stood their trial, and went to their deaths without opening their lips about their fellows; and it was many a long day before we ran down Flower, though we got him at last.

THE ITALY OF AMERICA.

At Point Conception, a promontory two hundred miles south of San Francisco, the western coast of America suddenly abandons its southerly course, and turns eastward. After continuing a hundred miles in this new direction, it again turns and resumes its original trend. The two hundred and fifty miles of coast-line between Point Conception and San Diego, a town and harbour on the borders of Mexico, form an oblique angle, in front of which a number of small islands are dotted down, which give the waters of South California something of the character of an inland sea. At a distance from the coast varying from fifty to a hundred miles there runs a range—or rather a series of ranges—of mountains, forming part of the great Sierra Nevada system. The principal of these ranges is that named San Bernardino, in which the Grayback peak reaches an altitude of eleven thousand feet. At the back of the ranges lie the deserts of Colorado and Arizona. This district, thus sheltered and enclosed, has a climate of its own. 'Except a tidal wave from Japan,' says Mr Dudley Warner, 'nothing would seem to be able to affect or disturb it.' And in his charming book entitled *Our Italy* he lays before his countrymen its various characteristics and advantages.

As the Americans are famous for their knowledge of meteorology, it is interesting to learn the causes to which the peculiarities of this particular climate are attributed. The land, it appears, gradually shelves upwards from the coast to the mountains, and then drops abruptly for six thousand feet to the level of the Colorado desert. This latter, being treeless and without water, is very hot in the day and very cold in the night-time. At sunset, therefore, a column of hot air ascends from the plain, and being prevented from travelling eastwards by a similar column from the neighbouring Arizona desert, makes its way westward to the Pacific. Here it cools, and, by condensing, causes a vacuum. In this way a new current is engendered, which travels eastward from the ocean, sweeps up the rising ground to the mountains, and then plunges down into the plains below. These alternating winds are but rarely changed, and it is to their prevalence that the characteristic feature of the climate of Southern California, its equability, is due. So marked is this characteristic, that the average monthly means of temperature taken at San Diego over a period of sixteen years gives a range extending only from fifty-three degrees five minutes in January to sixty-nine degrees in August. A still more remarkable return is this: in a single year the average temperature at three in the afternoon for the months of July, August, September, and October only varied by a single minute; September showing an average of sixty-

nine degrees five minutes as against sixty-nine degrees six minutes in the remaining three months.

It is not surprising that Mr Warner in seeking to recommend this district to his fellow-countrymen should call it 'our Italy,' since the affection of Americans for 'the poet of the nations'—as Mrs Browning calls Italy—is so warm. 'It is a Mediterranean,' he says, 'without marshes and without malaria, with cooler summers and warmer winters. It is an Italy whose mountains and valleys give almost every variety of elevation and temperature.' He points out that in such places as Santa Barbara, on the coast, and Los Angeles, fifteen miles inland, both the natural beauty and the climate of the Bay of Naples and the Riviera may be enjoyed. In advising his countrymen to try South California as a wintering place, he gently quizzes the cultivated New Englander; it is comforting to find that in so doing he uses terms which Englishmen are in the habit of supposing to belong exclusively to their own much abused climate. 'A man from the Eastern States is,' he says, 'accustomed to extremes. Such a person when he goes for his holiday may expect too much. He wants a violent change. If he quits the snow, the slush, the leaden skies, the alternate sleet and cold rain of New England, he would like the tropical heat, the languor, the colour of Martinique. He will not find them here. He sees the orange ripening in its dark foliage, the long lines of the eucalyptus, the feathery pepper-tree, the magnolia, the English walnut, the black live-oak, the fan-palm in all the vigour of June: everywhere beds of flowers of every hue and of every country blazing in the bright sunlight—the heliotrope, the geranium, the rare hothouse roses overrunning the hedges of cypress, and the scarlet passion vine climbing the roof-tree of the cottages. It is a fraud,' he says, 'all this visible display of summer, and of an almost tropical summer at that: it is really a cold country. It is incongruous that he should be looking at a date palm in his overcoat, and he is puzzled that a thermometrical heat that should enervate him elsewhere stimulates him here.'

Of course, Southern California cannot rival Italy in associations. The only touch of romance this American Italy can claim is derived from its early Spanish occupants, and is preserved in the few Spanish buildings which remain and in the softness of its names—Santa Barbara, Los Angeles, Bernardino, and the rest. The Spanish adventurers visited the country in the sixteenth century; one of them, Vasques de Coronado, gave his name to one group of the sheltering islands already mentioned. But the work of civilisation, the planting of vines and olives, was due to the missions which the Franciscan monks established among the Indians in 1769. The American did not arrive until 1840. Subsequently, as the possibilities of the place began to be known, a period of 'chance development'—as Mr Warner calls it—set in, a period in which the imagination was heated by the novelty of such varied and rapid productiveness. The 'frenzy' of 1886-87 was followed by the inevitable collapse; but in 1890 a movement of steady progress set in, and this is the condition of the country at the present time. The acreage of vines and oranges, of grain and corn, is rapidly

increasing. Nor are the towns behind the country districts. Parks and gardens are laid out, schools and colleges are founded, and first-rate hotels have been built.

But the South Californian coast is not only a Mediterranean of winter sunshine and blue waters, but a 'commercial' Mediterranean as well. All the fruits which Europe from time immemorial has gathered in the Mediterranean countries—raisins, walnuts, almonds, figs, oranges, lemons, and the rest of them—can be grown in this pleasant land. In respect of such supplies, America is to become independent of Europe.

In spite of this genuine progress there is still some 'tall talking.' This Mr Warner discovered when he was driven round Los Angeles. After the party had seen places that 'in their wealth of flowers and semi-tropical grandeur would rouse the enthusiasm of the most jaded traveller,' the driver was asked if there were any finer in the city. He replied: 'Finer—hundreds of them;' and then added meditatively and regretfully: 'I should not dare to show you the rest.'

The mountain scenery of Southern California is even more wonderful than its floral wealth. It includes the Yosemite Dome and Waterfalls, and the Grand Cañon of the Colorado. The Yosemite is familiar enough to the ordinary globe-trotter. The nature of the Grand Cañon is less known. In describing it Mr Warner says: 'We had expected a cañon; what we saw was not a cañon or a chasm or a gorge, but a vast area which is a break in a plateau.' The foreground of this space appeared to be filled by 'gigantic architectural constructions,' Amphitheatres, walls of masonry, fortresses, and temples of mountain size were some of the forms which these masses of rock presented to the eye. The whole was wonderfully coloured, blending in the sunlight into 'one transcendent suffusion of splendour.' The effect produced by this spectacle was different according as the nature of the spectator varied. In some cases, an awe-struck astonishment; in others, a sort of hysterical emotion, was produced. In his own case, Mr Warner experienced a confusion of vision which prevented him for some time from forming any mental estimate of what lay before his eyes. Such an effect is due in part to the suddenness with which the scene bursts upon the traveller.

THE MEADOW-GRASS.

THE grass is bending, quivering in the light
Of a hot July sun, and where the gray
And plummy flowerets of the ripening hay
Are thin as silken threads, up springs the white
Ox-eye, a butterfly in hovering flight.
But where the taller grasses are at play
With buttercups, that like a golden spray
Toss in their midst, the lean unhappy height
Of sorrel towers, a something burnt and red,
On which the feet of the quick lightning fell
When Heaven had thrown it from its thunder-bed.
Yet hark! The mower rings a sharpening knell
Upon his scythe—to-day we flower, we wed,
We learn—to-morrow we sleep well.

PLOVERS AND THEIR PECULIARITIES.

By H. A. BRYDEN.

In these whirling days, few people find time to stop and consider the ways and habits of the many interesting creatures that surround them. A sprinkling of enthusiastic naturalists, the more thoughtful among sportsmen, and perchance one in a hundred of the tourists who throng river and mountain and loch during their brief vacations—these are the only folk who have eyes and ears for the thousand-and-one interesting traits even of the avi-fauna of their own land. And yet, as every true lover of nature knows, there is a world of pleasure to be got out of a little quiet observation even in the fields, or hedgerows, or moors within reach of our great cities. At the present moment, for instance, in the meadows between Hampstead and Hendon, within five miles of seething London, the Green Plover, the Kestrel, and other interesting birds are constantly accessible to the observant eye.

The Plovers, an interesting and widely distributed group of birds, have some peculiar habits which distinguish them from all their feathered fellows. And of these habits one of the best known and commonest is their trick of simulating lameness and displaying extraordinary antics in order to draw off the passer-by from the vicinity of their nests and young. The common Green Plover or Lapwing is an excellent exponent of these antics—none better, indeed, in the whole family. This handsome bird, the Peewit of the English, Pees-weep of the Scotch, Dix-huit of the French, enjoys an immense geographical distribution, and is to be found not only all over Europe, but also in North Africa, and in Asia as far even as far-off China. Besides its trick of diverting attention from its eggs and offspring, this plover has another singular habit, shared with other members of the plover family, a habit of teasing and crying at—almost of threatening—human beings. In the grim and dangerous days when the Covenanters met in conventicle upon the

desolate hill-sides and lonely mosses of their country, this plover is said to have not seldom guided by its presence the soldiery in search of these stubborn worshippers. And for this reason the Covenanters and their descendants long nourished a peculiar hatred of the bird. So late did this antipathy exist, that Sir Walter Scott in his time remembered the Lowland shepherds destroying the nest of the green plover whenever found.

Personally, I can sympathise to some extent with this ancient detestation, for the reason that, in the far interior of South Central Africa, I have met with a plover of equally annoying habit. Wandering along the banks of the Botletli River, in the Ngami country, in search of wild-fowl, I have been so pestered and annoyed by a species known as the Spur-winged Plover, that at last, in a rage, I have raised my gun and shot one or two of my tormentors. These birds seem to have a strange dislike for the human form. They have excessively sharp, ringing voices—from which they take their native name, 'Setula T'Sipi,' or 'iron hammer;' and especially if one carries a gun, they greet the hunter with the most noisy and incessant cries, scolding perpetually, and swooping and dashing in quite a combative manner often close to one's head. These scolding tactics are by no means peculiar to the nesting season. Naturally, they disturb the fowl of the vicinity, as seems to be their object, and the gunner, as I have said, sometimes driven to desperation, at last turns upon the feathered plagues and wastes a charge or two of shot upon them. This plover, sometimes called the 'Blacksmith Plover' from the metallic clink of its voice, is a handsome species, garbed wholly in black and white; the curious sharp spur upon the point or shoulder of each wing distinguishing it readily from all its family, and hence its other name of Spurwing. It is seldom found far from water.

There is another South African plover, the wreathed plover, or well-known 'Kiewitje' (the diminutive of 'Kiewit,' a name manifestly adopted, like our English 'peewit,' from the cry of the

bird) of the Dutch Boers, which shares in a lesser degree in the noisy habits of the Spurwing. This beautiful bird is found throughout the length and breadth of South and South Central Africa, and its shrill, mournful cry is one of the best remembered night-sounds of the wilderness. The spurwing is usually found in small flocks, seldom exceeding half-a-dozen members; the kiewitje often flies in bands of from twenty to forty, and the sight of a human being is pretty certain to call up a chorus of sharp cries from the noisy creatures. They do not, however, pursue the traveller with so inveterate a hatred as the spur-winged plover, and indeed are often to be found in constant attendance round the hut or farmhouse of the colonist. This habit is probably merely a selfish one, as the presence of flocks and herds and of grain increases the sources of food-supply. For this reason also the kiewitje is no doubt so frequently found in the neighbourhood of old cattle kraals. On the other hand, it is as often as not found in the heart of the desert, far remote from water. This plover, from its 'lapwing' flight, its chiding cry, and malingering habit (in nesting-time), much resembles its European congener, the green plover.

That cautious and suspicious bird, the Gray Plover, a scarce plover in Britain nowadays, is another well-known inhabitant of Southern Africa, where, however, its plumage is always of a much lighter hue than in Europe.

A plover of North America, the Killdeer, is another of the family which has a harsh and chiding voice. This plover is very abundant on the prairies, where it seems very well to represent the peewit of England and the kiewitje of South Africa, and upon the approach of human beings at once proceeds to lift up its voice in a querulous and impatient wail.

The Dotterel (so called because of its supposed stupidity), or Dotterel Plover, although once pretty common in Britain, is now but an occasional visitant. Of old, there was a curious legend—very generally accepted among country-folk—that this bird faithfully imitated the movements of the fowler, and so usually ended by becoming snared in the nets. So widely accepted was this idea, that Drayton in his *Polyolbion* has several lines descriptive of the dotterel's silly ways. And Bacon says of it: 'In catching of dotterels we see how the foolish bird playeth the ape in gestures.' The idea probably arose from the plover-like habit of feinting and tumbling in the air close to the fowler's head, in which way, possibly, an occasional bird ensnared itself.

The Ringed Plover or Ringed Dotterel, a well-known British shore bird of small but extremely handsome form and marking, is also noticeable for its clever use of stratagems to divert the passer-by from its nest; its sharp note of alarm and suspicion being characteristically plover-like.

One of the most useful members of the great family of plovers is Nordmann's Pratincole, a species belonging to the sub-family of Glareolinæ or Pratincoles. This bird, a great favourite among South African farmers, seems to exist solely for one object, that of destroying or helping to destroy the devastating swarms of locusts. It is well known in Cape Colony and the interior as the Small Locust-bird. When these birds appear, it is looked upon as a pretty sure sign of approach-

ing locust flights; and when the locusts pass over the country, darkening the air as they fly, devouring every eatable piece of vegetation as they descend, and bringing temporary ruin over immense tracts of ground, the locust-birds attend them literally in tens of thousands, killing and devouring their prey in incredible numbers. Their attack is always made upon a settled plan; and a vast ring of insects having been enclosed and devoured, the insatiable birds press on again for the main swarm, never ceasing in their attentions till night falls upon the scene. The digestive powers of these useful pratincoles are marvellously rapid, and their bills are particularly well adapted for their work. As the locust is captured, the wings are neatly severed, and fall to the ground; and it has been stated by a competent observer, that, in the case of a vigorous attack by these birds upon a large swarm, the 'passer-by sees a continual shower of locusts' wings falling to the ground.' These most excellent birds are seldom or never destroyed, and so well do they seem to understand their immunity, that they view the near approach of man with almost absolute indifference. Great as is the havoc wrought by locusts in South Africa, in varying cycles, their ravages would be immeasurably magnified but for the unwearying exertions of the feathered armies of the locust-bird. The upper colouring of these birds is ashy-brown with a greenish tint, the wing feathers are black; the throat is creamy white, the breast ashy. A gorget or collar separates the neck and breast. The stomach is snowy white; the legs, eyelids, and cere are red. In length, the bird averages a little under a foot. The tail and wings are sharply pointed.

Another singular South African plover is the tiny Treble-collared Plover, the Sea-cow Bird of interior hunters. This diminutive little creature—only about six inches long—is neatly arrayed in brown upon the upper parts, black and white underneath; upon the throat appearing the three distinctive collars, first of black, then of white, then of black again. Sea-cow, or in Boer Dutch, 'Zee-koe,' is the colonial name for the hippopotamus; and the treble-collared plover takes its colonial designation (Sea-cow Bird) from its frequent habit of attending the unwieldy Behemoth. Running about the back and head of that amphibian, picking off insects and other odds and ends, this little plover seems perfectly at home, while the sea-cow apparently accepts its offices in good part. This friendship between wild and often fierce quadrupeds and small birds is of common occurrence in Africa and other countries; the rhinoceros, the buffalo, and the Burchell's zebra, among others, all having their peculiar feathered attendants. The sea-cow bird—unless when actually in attendance upon its big friend—betrays none of the jealousy or restlessness at the sight of mankind so often noticeable in other members of the family; and I have had no trouble in approaching quite closely to the birds as they fed fearlessly in the shallows and upon the mud-flats of African 'vleis' and rivers. The Spur-winged Plover, before mentioned, is itself a well-known attendant upon the crocodile, entering its mouth, as it lies with its jaws wide open, and cleansing it of leeches and other parasites. It seems to be now well recognised that

the Trochilos of Herodotus—who first chronicled this friendship between bird and crocodile—was no other than the Spur-winged Plover.

Besides the gray plover, the Norfolk Plover or Thick-knee, the Kentish Plover, the Common Turnstone, and the Ringed Plover (previously mentioned)—all birds of Great Britain—are found in Southern Africa. The well-known Golden Plover of England has been also cited by Dr Hartlaub as a denizen of South Africa. Its occurrence seems, however, to have been exceedingly rare, and, personally, I have never set eyes upon a specimen between the Cape and the Lake Ngami country. This bird, by-the-bye, takes its scientific name—*Charadrius Pluvialis*, the 'rainy plover'—from its wild, restless habits just before the approach of heavy rains and storms. There seems little doubt upon this point. The very name plover is derived from the old French word *plovier*—modern French *pluvier*—which manifestly had something to do with a rainy origin. Whether, because some members of the family were supposed to foretell, by their disturbed, restless cries and habits, the approach of storms, it is hard at this distance of time to say. Curiously enough, the German name for Plover is *Regen-pfeifer* ('rain-whistler'); so that the rainy connection of the bird would seem to be of wide geographical distribution.

As I have endeavoured to show, many of the plovers have habits which distinguish them from other feathered races. In Britain, unfortunately, year by year sees the gradual decline of the rarer species, in common with other ancient and notable birds of these islands. In the golden plover, we have, however, still a very numerous representative; while the peewit, despite the enormous consumption of its eggs, seems likely long to survive the assaults of the nest-hunters.

THE BURDEN OF ISABEL.*

CHAPTER XXIV.—GEORGE BY LAND AND SEA.

As the world wags, it was very excusable in Mrs Suffield to think a good deal more of her niece as the possessor of three or four thousand a year than as the schoolmistress earning a hundred and fifty. It was mainly on account of her urgency, therefore, that Isabel agreed that she and her father should spend their holiday at the same place as the Suffields; but it was wholly due to Isabel's own obstinacy that she resolved to take lodgings apart from her uncle and aunt: she believed that it would be better for her father not to see so much of his sister as would be necessary if he were her guest; and, moreover, he would be lost without his faithful henchman Alexander, and so Alexander must go with them. The next day, therefore, saw Isabel and her father thus established in a quiet house in Douglas in the Isle of Man, two doors from another quiet house in which dwelt the Suffields.

It was Mrs Suffield who had chosen Douglas for their holiday sojourn; and she had chosen it for two reasons—apart from the fact that the Isle of Man is the Paradise of Lancashire folk:

Lord Clitheroe was going to cruise in his yacht in the Irish Sea with Douglas for a centre or base; and her son George—who was so busy that he could not take a stretch of holiday—could easily manage to rush over to Douglas at each 'week-end.' The thought that Isabel and her son would thus, probably, be thrown a good deal together was now rather an incitement than a deterrent to her action. It cannot be said that she had formed any express plans to compass their marriage; she merely had the firm and honest conviction that Isabel was now a very fit match for her son, and that, on the whole, it would be a pity if Uncle Harry's money went out of the family.

George arrived in Douglas at the first week-end with unexpected magnificence. He also, like Lord Clitheroe, came in his yacht—which, he told his father, he had bought a bargain—but, as became a young cotton-lord, his yacht was propelled by steam, while the young aristocrat's was moved in the ancient way. The whole company—save Mr Maynor and his henchman—was assembled on the pier to receive him; and as soon as he stepped ashore he entered into a friendly argument with Lord Clitheroe regarding the speed of their respective vessels.

'Isn't she a beauty?' said he, regarding with admiration the rakish lines of his craft.

'Ye-es,' drawled Clitheroe. 'But I prefer a sailer to a steamer.'

'For speed?' said George—'for comfort?—or what?'

'For everything,' answered Clitheroe carelessly.

'Well, now,' said George, 'we've crossed from Liverpool in less than three hours with the tide against us too!'

'Ah,' said Clitheroe, 'have you? I crossed once in the *Sea-mew* there in two hours forty-three minutes from anchorage to anchorage with a good breeze on the quarter.'

'Oh,' said George, looking for a moment as if he had a mind to be incredulous. Then, repenting of that, he said: 'That's the *Sea-mew* lying out there—is it? She's a pretty thing. I tell you what, Clitheroe,' added he suddenly, 'if the weather holds, we'll both take a trip round the island to-morrow and see which gets back here first.'

'Good,' said Clitheroe; 'I'm game.'

And so they walked off the pier, Mr Suffield leading the way with his hand on his son's shoulder, and Lord Clitheroe following with Euphemia.

'Your cousin,' said Clitheroe to Euphemia, 'is a remarkably clever girl.'

'Isn't she?' said Phemy proudly. 'And she's a dear girl too!'

'I know a dearer,' murmured Clitheroe.

'Oh no, you don't,' said Phemy with a pretty pout. 'You only say that because you think I like it.'

'Now,' said Clitheroe, shaking his head down at her, 'that's not fair. You know I never say anything to you but what I mean and believe. But your cousin looks very handsome and distinguished: she's exceptional in that way, and with the fortune she has now, she should make a great match.'

'What,' asked Phemy with a meaning look, 'would you call a great match?'

'Dukes,' said he, 'are not common. But the Duke of Bilberry is single.'

'Is he not,' said she, 'very old?'

'No,' answered he; 'he is somewhere between fifty and sixty. But dukes, like politicians, take long to mature. For instance, I am over thirty, but I am regarded as a mere boy in politics.'

'So,' said she impudently, 'I daresay you are. But a duke won't do for Bell: she expects a prince.'

'A prince—does she? I don't think there are any princes in the market; no; no—what is the word?—quotations in princes. Besides, a German prince is not nearly so much worth while as an English duke.'

'I didn't say a German prince: I mean a fairy prince, you goose. Bell is not so easily pleased as me.'

And in spite of her bad grammar, Clitheroe smiled down on her with an indulgent tenderness.

Meanwhile, Suffield was marching along with his hand trustfully and affectionately on his son's shoulder, when a hideous foreigner, floridly dressed, saluted George with a profound bow.

'Who's that, lad?' asked his father. 'He is as ill-looking a scoundrel as I ever set eyes on.'

'You should not judge a tree by its bark, dad,' said George. 'That is Gorgonio, a Levantine or a Persian or Assyrian, or something of that sort; but he is a capital broker—knows all the turns of the cotton game.'

'Hast done business with him?'

'A little,' answered George.

'Hast dropped the firm's old brokers, then?' asked his father, with some concern. 'I don't like leaving old friends, lad.'

'No,' said George; 'I've not dropped them; but I don't give them all the business. They sent me some very bad cotton, and then didn't like my objecting to it.'

And thus they went on to their lodgings, leaving Lord Clitheroe at his hotel on the way. But before they left the Parade, George asked Isabel and the others if they would excuse him if he let them go on without him: he had caught sight of a man with whom he would like to have a word. So he left them, and hung behind to intercept Mr Gorgonio if he returned—as he expected he would—along the Parade. Presently Mr Gorgonio came and again saluted him.

'I guessed from your smile,' said George, 'that you had something to tell me. Am I right?'

'Quite right, Mr Suffiel,' said Gorgonio in a thick, somewhat cavernous or sepulchral voice. 'I had news this morning, and I intended to wire you on Monday when I go back to business in Liverpool. It is splendid news, which I have got from a gentleman in Savannah which I trust very much indeed. But come into my hotel, which is here, and I will show you his letter.'

'Is it about prices, or quantity?' asked George.

'What, Mr Suffiel, do you think?' said Gorgonio. 'Quantity, Mr Suffiel!—quantity! But will not quantity touch prices? I think so!'

When they sat down in a quiet corner of the coffee-room of the hotel, Gorgonio produced from his pocket-book an American letter, which he handed to George. The gist of it was that, contrary to general expectation, the cotton crop would prove to be not an average but a very

poor one, and that, therefore, those who meant to buy should buy at once before the fact was widely spread. There were reasons given and figures, which looked important and tangled, and which accordingly George took pretty much on trust. The announcement impressed him. In silence he handed back the letter, and in silence—but with a sharp eye—Gorgonio received it.

'I suppose,' said George at length, 'your correspondent knows what he is talking about?'

'Mr Suffiel,' said Gorgonio, 'there is no man which knows better. The price to-day for September delivery was,' whispered he, leaning over the table and tapping on it with his nail, 'only 5½d. Ah! what a beautiful, what a splendid corner I could make!—more better than Morris Ranger's!—if I had but a little bit of money!' He glanced keenly at George, whose eyes were flitting thoughtfully about the opposite wall. 'But no! I have not the money!'

'Will you wire to your office to-morrow morning,' said George with resolution, 'to buy as many Septembers as possible at 5½d.?''

'Wire?' exclaimed Gorgonio. 'Never! Never! In half an hour!—in ten minutes!—after the wire has been delivered at my office, every one knows it, and every one runs on the Flaga to buy Septembers, and the price go up! Never!—never wire! We will wait till Monday, Mr Suffiel. I do not think it will be any difference. Maybe'—and Mr Gorgonio very knowingly put his finger to his nose—'the price will be lower than five-a-half.'

'On Monday, then, first thing,' said George, rising and giving his hand to Gorgonio. 'And I will come along to you after I have docked my yacht.'

'On Monday then, Mr Suffiel,' said Gorgonio.—'His yacht!' murmured he, looking after George. 'Never mind, Gorgonio. Some day you also will have a yacht.'

George hurried off to his parents' lodgings, and, when all went out to enjoy the cool of the day after dinner, he and Isabel chanced to walk together. Isabel had felt that George looked coldly on her, and now she gathered the reason. She spoke first of the small legacy which Uncle Harry had left to Daniel Trichinopoly, his 'faithful black servant,' and that led her to speak of something else.

'By the way,' said she, 'Mr Ainsworth wrote to you—did he not?—a little while ago about a curious kind of adventure he had with Daniel in a strange place. What have you done about it?—anything?'

'I acknowledged the receipt of Mr Ainsworth's communication,' answered George.

'That all?' said Isabel. 'Did you not think there was anything worth taking notice of in the story he told you? I thought there was.'

'You knew it, then?'

'I knew it. Mr Ainsworth told me when he came back from the place; I had asked him to bring my father from there. Did you really read his letter?'

'Yes,' said George, with a manifest blush; 'I ran through it. It seemed to me he was just setting down the ravings of a maniac. Most absurd. Perhaps it was Daniel, perhaps it wasn't; though of course Daniel was in London at the time: he had gone up to travel with

Uncle Harry. In any case, I suppose the talk of a man in an opium sleep is not worth attention. A man has visions, and he tries to describe them : that's all.'

'George,' said Isabel very seriously, 'what is the matter with you? You used to like Alan Ainsworth, and to admire him and his work. Now you don't; and when he writes what he means to be a friendly letter, you throw it in the fire—no; it is summer-time: you tear it up into little pieces and throw it into your waste-paper basket.'

'I did not tear it up at once,' said George, rather sulkily. 'But I didn't ask for his letter: it was meddlesome in him to write it.'

'George,' repeated Isabel, 'you don't like Alan. Why?'

'I don't like him!' said George. 'Above all, I don't like your calling him "Alan" !'

'Don't shout, George!' said Isabel.

'And I don't like,' continued he, evidently feeling that he had broached the subject and caught its full flow—'I don't like his being about with you and your father so much. You may not perceive it, but in the sly way those literary fellows know how to work, he has been making love to you! It's not fair, Bell!'

'Don't be absurd, George,' said Isabel, now very serious indeed. 'Mr Ainsworth has been a very good friend to me in London. He has helped me with my father in a way I can never be grateful enough for. He is alone in London, and I asked him to come and see me and my father—I asked him!—and we have talked and been friendly. And that is all. Really,' added she, after a moment's silence and reflection, 'I don't know why I humble myself to give you this long explanation.'

'You know well enough why you do it, Bell,' said George; 'because you know that, if I have spoken as I have done, and said disagreeable things about Ainsworth, it is only because I love you, and nobody but you!'

'Hush!' said Isabel. 'Lord Clitheroe and Phemy are behind us. And I believe they are laughing at us: they seem so tickled with something.'

On the next day—which was Saturday—the race took place between the rival yachts. It was not a public event. The vessels stole away together—the *Swiftsure* and the *Sea-mew*—and turned, the one to the north and the other to the south, without any persons but those on board being aware of their purpose. Lord Clitheroe was skipper of his own craft; while George, who had not yet acquired a certificate of navigation, had to have a sailing-master. A breeze from the west was blowing, and George determined to use what sail they could as well as steam.

'But is that quite fair?' asked Isabel.

'We did not bargain to use steam only,' answered George. 'Clitheroe knows we can carry sail, and he must know, therefore, we would not be such fools as not to do all we can to win.'

'Quite so,' said his father.—'Oh yes, Isabel; I think George is right. If Clitheroe did not expect it, it would be different.'

So George was now hauling on a sheet, now examining the log-line to see how many knots they were making, and now shovelling coal out

of the bunkers handy for the stoker to throw into the furnace.

Only over luncheon did George rest. He was in good spirits, and inclined to be light-minded about Isabel's fortune. He asked her what she was going to do with it; and she answered that she had several plans for getting rid of her large yearly income, but none was quite matured: she was more reserved with George on these matters than she had been with Ainsworth: she thought herself it was strange that she was not at all tempted to take George into her confidence.

'You should put your money into the business, Bell,' said George (and he seemed to mean it). 'I could give you fifteen or twenty per cent. for it, and then you would have at least ten thousand a year, instead of three or four.'

'But,' said she, looking somewhat surprised and alarmed, 'I don't want ten thousand a year; I find the responsibility of three or four quite enough.'

'No, no, George,' said Mr Suffield. 'Let Bell's brass alone. We won't put it in the business. Harry had it very well and safely invested, and we'll let well alone; besides, Bell can't for so long reinvest anything without the consent of her executor and trustee, and I'm that person.—Just pass me the claret, lad.'

The two yachts passed and hailed each other off the ancient town and castle of Peel.

'Oh, doesn't she,' exclaimed Isabel, looking after the *Sea-mew*, 'look lovely and living—like a great sea-bird with her white wings spread!'

'She sails well,' said George, 'and she has a good wind: she'll take a great deal of beating; and he turned away to shovel more coal into the furnace.'

That night, the race being won by George by some fifteen minutes—when George steamed into Douglas harbour the white wings of the *Sea-mew* were just visible off Laxey—the whole company dined in the rooms of the Suffields; and afterwards Mr Suffield observed to his wife: 'I think I must wake up our George: he is not nearly so attentive to Isabel as he ought to be in all reason.'

'Don't meddle and spoil, my dear,' said his wife. 'You are a dear good man; but between a lad and a lass you don't see any farther than the end of the nose on your face. You had much better leave George alone.'

IN OUR CHURCHYARDS.

IN the green grassy Churchyards of our old parish churches in rural districts, there are several objects of interest over and above the monuments to the memory of the dead. In some of these sacred spots are venerable preaching-crosses, and crumbling old stone seats for the accommodation of those who listened to the preachers; in others, lichgates and lich campaniles; in a few more, isolated towers for the bells; in others, wells, curious stiles, sundials; and, in some parts of the kingdom, contrivances for the funeral or dead-light, or the tall round towers our French neighbours call the 'lanterns of the dead'; and, here and there, solitary specimens of man's work in curious forms not to be placed in either of these

categories. There is, probably, no churchyard in which examples of all these relics are to be found grouped together; but there is a very large number in which one or more of them may be noted.

It is thought every churchyard in old times had a cross in it of more or less sculptural beauty. And as several ancient churches in the southern counties have external seats built against them, with evident reference to the situation of these crosses, we may assume services were occasionally performed at them, or sermons preached from them, and these stone benches were intended to be occupied by the listeners. There are seats, for instance, against the south walls of both Glastonbury Church and Spraxton Church, in Somerset: and the crosses in both churchyards are towards the south-east side of both edifices; and at Bicknoller, in the same county, the seat is on the eastern side of the church, and the cross faces it. But these seats are not always part of the fabric. In Drayton churchyard there are circular stone seats round two fine yew-trees, that may have been used for this purpose. The crosses are generally raised on a base composed of a few wide steps; and ripe with their years and centuries of sunshine and storms, are extremely interesting and suggestive in their appearance. Herefordshire and Gloucestershire are especially rich in these relics. They are, however, to be seen occasionally in other counties. Here is Welford Church, in Berkshire, very ripe and hoary as to its round tower—on which an octagonal spire was superimposed when it was about five hundred years old, three centuries ago—and very impressive generally, and especially in the matter of the delicate and rich tracery in the windows; and on the south side of it we may see, towering over the pale tombstones, a tall cross. There are no great wide steps to this example; but, as a rule, we may conclude the preacher stood upon the tiers of masonry forming the base, with his audience surrounding him. We know the sermons were marvels of oratory, and occupied two and three hours in the delivery in Tudor as well as Stuart times; and we may assure ourselves the listeners weighed every word as it was borne to them through the summer sunshine. There is a tall cross nearly perfect, raised on four circular steps, in Stoughton churchyard, in Leicestershire. In Lincolnshire, there are two good examples, at Bradley and Tattershall. In the churchyard at Lanivet, in Cornwall, are two crosses, one of which is eleven feet high and the other a foot higher.

The lichgate (that is, corpse-gate, from Saxon *lic*, a dead body) is another feature of much interest. This is more frequent in Devonshire and Wales than in other parts of the kingdom, though most counties have some examples. In Scotland there are also a few still remaining, more or less dilapidated. The lichgate is a covered stone gateway of dimensions that admit of mourners resting under the shelter of the roof before carrying the dead to their last resting-place. Sometimes the roof is placed with the gable over the entrance; and sometimes with the slanting side in that position, and the gables at the ends; and some lichgates are furnished

with gates that revolve on a pivot, though more frequently with those that open and shut in the ordinary manner. The most complete examples possess a lichpath, lichseats, a lichstone on which to rest the mourners' burden, and a lichcross. Both stone and cross are frequently found in Cornish churchyards. In the pathetically simple old Welsh churchyards, full of slate memorials lying flat over the graves with fringes of the 'spears of the grass' round them, the lichgate with its moss-grown roof, worn-away seats, and narrow pathway, is an especially picturesque object. There is one leading into the churchyard at Gyffylliog, in Denbighshire, with the slant side of its sloping slate roof facing the road in a bower of chestnut trees. It is built of stone, and has a step down into the churchyard at the inner side of it. There is another in a deserted little church on the sea-margin, near Pensarn, in Merionethshire, turned gable-ways to the approach to it across the grassy marshes, with a wind-bleached wooden door to it like that of a country cottage. A third, at Llanbedr, close by, less affected by 'the sweet reproof of storms,' is more inviting, with only a light wicket in it to impede the view of the venerable little church in its setting of graves and monuments. Besides these corpse-gates, as they are sometimes called, there are, chiefly in Norfolk, lich campaniles, or low-walled erections in which bells are hung almost close to the ground, as in the churchyard at Southborough. They are often roofed with thatch. Occasionally, too, the real lichgate is furnished with a bell turret. In some parishes this gate is called a lichstile, and in others a churchstile, which has been corrupted to churstele.

In some churchyards, standing at the distance of several feet from the church are isolated towers for the church bells, high and of a majestic stateliness, or made of almost unhewn timbers in a simple framework. They may be after-thoughts; or a wave of rivalry in the matter of bells and bell-ringing may have passed over the land, and the structures to which these towers are appendages may have been considered not sufficiently strong to sustain the strain of great weights in movement; but there they stand with mysterious reticence and with most impressive outline, with their bells 'calling, calling.' One example built of timber, at Brookland, in Kent, is placed about six feet to the north of the nave, and rises in three stages, pyramidically, looking over the 'brave bleak land' serenely. Those in Herefordshire and Norfolk are of more magnificence. They are not to be confused with the six detached towers in Cornwall built on hills, to indicate the situation of the churches to which they belong in the valleys below. The example in Ledbury churchyard is a very fine one, of a stately sturdiness and comeliness. Others in the same county are more primitive in their outlines, and stand in the deep grass, among the rounded graves, with interesting simplicity.

Passing on to the 'lunterns of the dead,' it may be mentioned there are a few examples in France that help to throw a broad light on this subject. In the districts where cromlechs and other Celtic remains abound, there are, in a few churchyards, tall narrow straight towers, of much smaller dimensions than those intended for bells, being about five times the height of a man, more or

less, which have openings at their summits through which a light, drawn up by a cord over a pulley, would throw gleams around. These lantern-towers or hollow pillars, like the preaching-crosses, are placed on platforms composed of stone steps; and they are likewise furnished with a slight projection of a shelf-like make that has evidently been more than a convenient resting-place for the lamp whilst being trimmed. In one perfect example, there is an extra step in front of it, as though it was intended to serve as a small altar. The little opening, through which the lamp or light was passed into the interior, is at a sufficient height from the ground to enable any one in charge of it to get at it easily. The top of the lantern is generally finished with a cross. The presence of these relics in the regions rich with Celtic remains seems to associate their origin with some custom of great antiquity, though those remaining do not appear to be of earlier workmanship than that of the twelfth century. We may have remains of others in this country that have been mutilated or altered beyond recognition. In one of the French examples to which allusion has been made, the platform consists of four tiers of round steps, whilst the tower is of a square plan with the angles recessed; another is a round tower on a square base; and a third is a square tower on a square base. It has been suggested that they may have been intended to hold wax tapers, to give additional solemnity to funeral ceremonies; but the fact that the openings at their summits direct the rays of light to a distance, rather than to the ground immediately around them, does not give countenance to this view. They occur chiefly in churchyards adjoining the great lines of communication, or in very frequented places; consequently, it is likely they were intended to light up the land of graves, and divest it of some of its terrors, for the sake of those passing by; as well as to maintain an impression of care and regard for those who were buried in it.

Wells in churchyards are now extremely rare, though, on account of water having always been a requisite for church purposes, many sacred edifices must have been supplied with it by their means. They were sunk in the first instance, probably for the convenience of the builders, and then improved and made permanent. The cloisters of our large monasteries were thus supplied with water. And, on the Continent, wells are sometimes also met with in crypts. St Andrew's Well, near the east end of Wells Cathedral, is a fine spring of more than usual abundance, and, after overflowing, falls into the grand old moat, and becomes one of the distinguishing characteristics of the ancient city.

Sun-dials are most frequently found placed over the entrance-way of porches, though, occasionally, the mutilated shaft of a cross has been made into one in a more central position of the churchyard. There are a few examples of Saxon antiquity, some that the yellow-haired, blue-eyed Angles placed where we see them now, but the bulk of them belong to times when dialling had reached a more advanced stage.

Church stiles, with their steps up from the ground, their barrier to be stepped over at the top of them, often a stone slab fixed on end, and their steps down again on the other side into the

churchyard, are more common. They do not always take this form, being also often scarcely more than bars in some places of various ingenious contrivance. Whittingham churchyard, on the Alne, may be mentioned as a representative specimen. It has two of these stone stiles, one at the eastern angle and the other at the western, as though an old-time footpath running through the ground was thus protected. The river winds through the village, which is pleasant with trees, fountains, and a peel-tower. There are at both ends of the churchyard, placed at gaps in the wall, a few high narrow steps; and in the gaps stone slabs are fixed, edgewise; and the steep steps are so arranged as to afford good footing whilst crossing these stones, and to form a second set of steps by which to descend to the level of the pathway on the other side. The church has a Saxon tower and Saxon angle-stones at the west end of the nave; and it had a Norman arcade of four arches, only taken down within remembrance. It has much more work still standing of the thirteenth and fourteenth centuries; and these stiles are still the means, in these Victorian days, by which the honest country-folk enter the sacred precincts that were reared so long ago, and have been so much to so many generations.

In Ryton churchyard is a prehistoric work. This is a large tumulus of, apparently, ancient British origin. Among other miscellaneous objects to be seen in some instances, and scarcely noticed, are fragments of ancient fonts, which, when removed to make room for new ones, have been left lying among the gravestones in the churchyard. A stone altar slab that has been discarded has also been detected by a diligent observer. As in most other matters, the more knowledge we bring to bear upon the subject, the more we find in it.

THE SACRED BEETLE.

CHAPTER II.

ON the following day, Dr Carl von Eberstein rose from his couch more firmly fixed than ever in his purpose, despite the alarming dreams which had so harassed him during the past night. He determined, as a preliminary measure, to confide his precious secret, and his resolution to fathom it, to his bosom friend and co-Professor, Herr Emilinus Werther, who was also an Oriental scholar, and had dabbled considerably in Egyptology. As he proceeded with his toilet, he revolved in his mind the various arguments he intended bringing to bear on the subject, for Herr Werther was of rather a stubborn and obstinate nature, and would be very sure to combat fiercely—and probably with a strong seasoning of ridicule—the idea of the authenticity of such a document in the nineteenth century; and would most likely declare the whole thing to be a hoax, perpetrated by some of the mischievous and laughter-loving students of the university. These reflections, however, did not cause Von Eberstein to waver in his purpose, although the mere cogitation thereon caused him many a secret twinge. Summoning up his courage, he armed himself with his document, the translation thereof, and an enormous umbrella, and sallied forth to call on his friend.

On his arrival, and on his announcing that he had come on a matter of serious import, to which he wished his friend to give his undivided attention, Herr Werther at once ordered two large 'schoppen' of beer, placed the jar of canaster on the table, filled his pipe, took a preliminary swig at his jug, and bade Von Eberstein proceed.

As the latter unfolded his whole discovery, from the finding of the manuscript in the mummy to his deciphering thereof, the Professor became gradually excited; and when Von Eberstein announced his unalterable determination to go in search of the spot described in the document, and his intention to fathom its meaning, and find out what there was to be found, the Professor waxed enthusiastic, and, dashing his smoking-cap on the ground, vowed that he also would partake in this adventure. But on Von Eberstein's pointing out that both of them could not be spared at once, and that the right of discovery rested with him, the Professor gradually, though rather sulkily, calmed down, and acquiesced in the reasonableness of the argument.

For some hours the two sat talking, now calmly, now excitedly, over the find; but they both agreed on the one point, which was, that Von Eberstein should at once apply for leave, and start at the earliest possible moment; and that the whole matter should remain a secret locked up in their own breasts. The Professor also stipulated that at intervals his colleague should forward him news of himself and his progress towards his goal. Then they separated; the one to obtain his leave from the authorities; the latter to puzzle over a copy which he had taken of the precious manuscript.

That night the Professor received a brief note: 'DEAR WERTHER—I have succeeded in getting my leave, and am off to-morrow morning. Come over and see me to-night.—Yours, v. E.'

The Professor obeyed the summons; and the two sat smoking and talking until well into the small-hours, when they parted with a hearty shake of the hand, and 'Good-luck to you, Carl!' from the elder man.

What were Von Eberstein's thoughts as he sat alone in his room gazing round at his packed portmanteaus? What visions of treasures to be found, of secrets to be unravelled, of— He lost himself in wild and visionary imaginings! But eventually common-sense regained its sway. Nature asserted herself, and he went to bed to sleep soundly and dreamlessly. The next morning he was *en route* for Egypt, the land of the Sacred Ibis, the Nile, and the Pharaohs.

Some weeks later, Von Eberstein found himself one of a rather mixed party who were assembled in a 'dahabieh' on their way to Philæ and the First Cataract. There was an American young lady of about twenty-three, travelling by herself, after that delightfully independent fashion our cousins across the water love. There was a very solid clergyman and his wife, who had 'done' the Holy Land, and were now enjoying a little pagan relaxation among the Pharaohs. A young English swell—no need to describe *him*; two elderly maiden sisters of a certain age; a hideously ugly English 'nouveau riche'; and our hero. A nice square little party of eight. As yet, the only ones who had quarrelled were the clergyman

and his wife, the latter having roundly taxed her spouse with 'flirting and making eyes at that disreputable American girl who travels by herself!' Alas, poor priest! I'm afraid there was a 'soupçon' of truth in the accusation, else why did you blush so furiously and look so extremely awkward. Miss Emerson is only laughing at you. This lively young lady, by the way, had tried her charms and wiles on our young Professor, and was secretly much annoyed at his insensibility. He had other and more serious things to think of than the colour of a lady's eyes, or the tints in her golden-brown hair.

The river-craft sped on with a fair wind, and within the time appointed by the Rais, the party arrived at Philæ. Here they broke up and separated, each on his or her own particular quest, to hunt for curios, or to daub sketches of the scenery and ruins. The Professor, however, had laid his plans. He spoke the language, and therefore found no difficulty in obtaining an interview with the most potent of head-men in the vicinity. A judicious bribe ensured him the best men the latter could procure; and that night the little party, armed with cords, spades, axes, and all requisites for their purpose, set out for the temple of Abon-Symbal. The Professor led the way, and, fixing on the spot indicated in the document, bade his workmen dig. A very few minutes sufficed to lay bare a large slab of stone. This was rapidly removed, and lo! before them yawned the black mouth of a chasm of unknown depth. A few burning tufts of dry grass and some crackers were thrown down to dissipate any poisonous gases there might be, and then a lantern was lowered: the depth proved to be about forty feet. Rapidly a rough but strong windlass-like apparatus was rigged up, and a native descended. On his calling out that all was well, two others followed him, and the Professor came last, the sheik—who had suspected some new find, possibly of value, and had therefore come with the others—remaining behind. The Professor drew this individual aside, and said: 'Should there be any treasure here, it is yours: I want none of it. I have come to examine a mummy which I believe to be that of a king. Therefore, watch your men. My own people know that I have come here to open the place, and will be here shortly themselves, so beware of any foul-play.'

The sheik protested he was honest—as indeed he proved to be—and Professor Carl von Eberstein was lowered into the pit, his heart beating furiously at the thought that he was at last within arm's-length of his desired goal. Arrived at the bottom, where he found the labourers awaiting him, he glanced round. There were three sarcophagi. Promptly selecting the farthest from the entrance, as specified in the manuscript, he set the men to work, and very shortly they had loosened the lid of the sarcophagus. A few minutes' more labour, and it was lifted clean off and slipped to the ground.

'Lift out the mummy!' ordered Von Eberstein.

They obeyed.

'And now hold the light for me to see.' The lantern was held on high, and the Professor proceeded rapidly and with a skilled hand to remove the wrappings in which the mummy was swathed.

His obvious excitement was noted by the natives, who exchanged glances and a few low, muttered words. As the Professor neared the end of his task, he felt a hard knob under his fingers on the breast of the embalmed corpse. A few more turns, and he held it in his grasp. With hands trembling with emotion, he unrolled the tiny packet, and there, in his open palm, lay a small, perfectly-formed bronze beetle—the sacred scarab of the Egyptians. With uncontrollable emotion, he replaced it in its wrappings, deposited it carefully in a breast-pocket, and then turned to ascend to upper earth once more. But now the natives, who had been whispering to each other, and who evidently imagined that he had discovered some rare jewel—for they had not seen what it was that he had gazed at in his hand so rapturously—slipped between him and the rope.

'The effendi must show us what he has there before he leaves this place: it is the custom of the country.'

'I shall do no such thing. Stand aside!'

'Then we must use force.'

'You must, you rascals?' and he whipped out a revolver, which he held to the head of the nearest man, who dropped on his knees, thoroughly cowed and imploring pardon. 'Back, back, to the farthest end of the tomb, or I shoot!'

Disheartened and terrified, the three rascals obeyed.

'Ho! sheik!' he called.

'Sir?' came the answer, as a dusky face observed the opening.

'Haul up. Quickly now!' And, still waving his revolver towards the affrighted and cowering group, our hero emerged into open air. 'I have seen what I want to; behold! this scarab is all I have taken as the token of remembrance of a great king. Now, if you will send one man with me, I will depart, and you can do as you will down there; I have only opened one sarcophagus.—And hark ye, sheik! Those men down there are rascals. And also listen: I have permission to open this tomb, but you have none. Therefore, you should be quick in what you do.'

The sheik promptly told off a guide for Von Eberstein, and then disappeared down the pit, while our hero strode away on his return journey. To him it seemed as though he trod on air. The night-breeze was pure and clear; a distant prowling jackal gave forth its dismal cry; but in his then state of mind it sounded to him like music. His thoughts went wandering back to the old high-priest whose body he had so summarily desecrated, and whose treasure he had so unceremoniously possessed himself of. He wondered what its attributes and powers might be, and how he should discover and unravel them. Vague dreams of the genii of old, and their talismans, flitted through his brain. The ancient manuscript had not lied. After thousands of years of silence, the dead had given up its secret to him, and had pointed the way. He had followed its directions, and they had led him without fault or pause to the exact spot where he was told the treasure—the sacred beetle—lay; and there had he found it, on the breast of the dead man. The weirdness of this uncanny and precise revelation, which had been laid bare before

his eyes after so many fleeting generations had come and gone, struck him with a strange idea: was it really the nineteenth century, and was he himself really Professor Carl von Eberstein? Or had he gone back to the old ages?

The sound of his Arab guide humming a tune assured him of the actuality of the present, and he strode along, still wondering and puzzling his brains as to the potentialities of his prize, until the masts of the 'dahabieh' rising in the distance, and standing out clear-cut against the faint light of the false dawn which tinged the sky, brought him to himself. His guide paused and pointed. With a few words of thanks, and the yet more welcome gift of several silver coins, he stepped lightly aboard; while the Arab ran back like a deer to his comrades, in order not to lose his share of the spoil. Our hero moved softly into his cabin so as not to awake the sleepers; and, throwing off his clothes, but placing his prize, securely fastened in its wrappings, in a tiny metal box, he fell asleep, clutching his precious find to his breast.

MENDELSSOHN IN SCOTLAND.

MENDELSSOHN made his first visit to England in April 1829. Towards the end of the season he put in execution a long-cherished scheme of making a tour in Scotland. He was then only twenty years old, and his letters home at that period are full of the freshness and buoyancy of youth, more indicative of the schoolboy than the man; in happy contrast to his later life, when oppressed by care and overwork. The Waverley novels, there can be little doubt, were the chief cause of Mendelssohn's visit to Scotland. The series had just been completed, and he had read them all. It may easily be imagined that they exerted a powerful influence on a cultured mind like his, and made him desirous of seeing for himself scenes of mountain and flood, such as he had only hitherto read of. He wished also to meet the great Wizard of the North face to face; 'chiefly to escape a scolding from you, dear mother, if I return without having seen the lion,' he wrote. It is more, however, to Mendelssohn's friend, Carl Klingemann, who was then Secretary to the Hanoverian Embassy in London, that we owe what we know of this excursion; but at the best our knowledge only consists of disjointed and fragmentary incidents related in letters to the family at Berlin.

Mendelssohn and Klingemann, teeming with boyish spirits, set off from London by stagecoach on their travels—both cannot enough express their admiration for this peculiarly English institution, then in its palmiest days—and arrived at the gray Metropolis of the North one Sunday towards the end of July. The very first thing they did, which, certainly proved their boyish energy, was to climb Arthur's Seat. After describing the prospect from the top in glowing terms, Mendelssohn adds: 'Why need I describe it? When God himself takes to panorama-painting, it turns out strangely beautiful. Few of my

Switzerland reminiscences can compare to this; everything here looks so stern and robust, half enveloped in haze or smoke or fog.' Farther on, he says in reference to Edinburgh: 'It is beautiful here! In the evening, a cool breeze is wafted from the sea, and then all objects appear clearly and sharply defined against the gray sky.' He had a bathe while in Edinburgh, but does not name the spot; all he says about it is that his swim in the deep Scotch ocean was pleasant, and that it tasted very briny. The last evening was spent in a visit to Holyrood Palace, 'where Queen Mary lived and loved. The chapel close to it is now roofless, grass and ivy grow there, and at that broken altar Mary was crowned Queen of Scotland. Everything around is broken and mouldering, and the bright sky shines in. I believe I found to-day in that old chapel the beginning of my Scotch symphony.'

If Mendelssohn was charmed with Edinburgh, he was no less charmed with its people, for he quotes of them: 'How kind the people are in Edinburgh, and how generous is the good God! The Scotch ladies also deserve notice; and if Mahmud follows father's advice and turns Christian, I shall in his place become a Turk and settle in this neighbourhood.'

The Highland tour was planned from Edinburgh. It was to be viâ Stirling, Perth, Dunkeld, to Blair-Athole; then by foot over the hills to Inveraray, to Glencoe, the isle of Staffa, and the isle of Islay, where they were to stay several days; then they were to proceed up the Clyde to Glasgow, then to Ben Lomond, Loch Earn, Ben Vorlich, Loch Katrine, and home by Cumberland. But the best-laid schemes do not always succeed, and neither did this; at least the original plan was not carried out, for they were unable to accomplish all they had proposed.

Mendelssohn had hoped to meet Sir Walter Scott in Edinburgh, but being disappointed, he resolved to seek the lion in his den. He and his friend accordingly drove all the way to Abbotsford; and Klingemann gives a most absurd account of their encounter with the great man. But to it Mendelssohn adds: 'This is all Klingemann's invention. We found Sir Walter in the act of leaving Abbotsford, stared at him like fools, drove eighty miles and lost a day for the sake of at best one half-hour of superficial conversation. Melrose compensated us but little; we were out of humour with great men, with ourselves, with the world, with everything. It was a bad day.' Mendelssohn, as may be seen, was in a bad temper.

We find them next, under date August 3d, at Blair-Athole, where it was a 'most dismal, melancholy, rainy day.' The day before had, by way of variety, been lovely. In the morning they drove in an open carriage, and then walked twenty-one miles. 'We passed from rock to rock, many waterfalls, beautiful valleys, with rivers; dark woods, and heath with the red

heather in blossom.' Mendelssohn sketched, and Klingemann hit upon the divine plan of making rhymes at every spot where he made a sketch. On the evening of the 3d, they reached Bridge of Tummel, but the weather was still bad. 'A wild affair! The storm howls, rushes, and whistles; doors are banging and window shutters are bursting open. Whether the watery noise is from the rain or from the foaming stream, there's no telling, as both rage together.' They had put up at a typical Highland inn. Their room was large and empty, the wet trickled down the walls, and the floor was so thin that they could hear the occupants of the room below singing drunken songs and laughing. This was all very melancholy; and it is questionable if they found much consolation in hearing 'the little boys with their kilts and bare knees and gay coloured bonnets, the waiter in his tartan, old people with pig-tails, talk helter-skelter in their unintelligible Gaelic.'

Next morning they left Bridge of Tummel, but took the bad weather with them. Klingemann describes the journey in somewhat uncomplimentary language. Up hill and down hill, finding it easier to walk than sit in their 'cart'—what kind of vehicle Klingemann meant is not very clear, possibly he meant a dogcart—even although they had to stalk through moors and heather and all kinds of 'passes.' Here Klingemann indulges in a weak-minded joke: 'Nature here is so amply provided with them [passes], that Government does not ask for any.' They saw smoky huts stuck on cliffs, women looking through the window-holes, and now and then herds of cattle, with their attendant Rob Roys, blocking the way. At last, to their relief and delight, they reached civilisation—Fort-William, where they encountered the very newest piece of culture, a steamboat; and they found themselves among many people, enjoying the sea and the sunshine, good cheer, and society.

They proceeded by sea from Fort-William to Tobermory, where, after their wanderings, they found rest for their weary feet. By contrast, it seemed a charming place. Klingemann says that from his earliest days he had confounded the Hebrides with the Hesperides; and if they did not find the oranges on the trees, they found them in the whisky-toddy. It may be noted, by the way, that both had by this time acquired a taste for the national beverage.

On the morning of the 8th, Mendelssohn and Klingemann, along with many others, embarked on the wide Atlantic in order to visit Staffa and Iona. Shortly after starting, the barometer sank and the wind rose, and the 'ship-household kept its breakfast almost to itself.' Like troops under a withering fire, the passengers fell rapidly; and the sea, which is no respecter of persons, laid low the great Mendelssohn himself: he was most unpoetically and desperately sea-sick. As Klingemann remarks, he was on better terms with the sea as a musician than as an individual with a stomach. On reaching Staffa they put out in small boats to see the famous cave. 'A greener

roar of waves surely never rushed into a stranger cavern—its many pillars making it look like the inside of an immense organ, black and resounding, and absolutely without purpose, and quite alone, the wide gray sea within and without.' This is Klingemann's comment. There is, unfortunately, no record of what Mendelssohn felt on the occasion; perhaps he was too sea-sick to feel anything beside.

They next landed at Iona. Its ruins, its loneliness, its desolation, its graves of ancient Scottish kings, and still more ancient pirate-princes, impressed them perhaps more than Staffa did, for it was not the desolation of nature alone, but the desolation of departed man as well. Staffa and Iona seem to have been the culminating point of Mendelssohn's admiration for the Hebrides. Indeed, he says that they affected him in an extraordinary fashion. The impressions conveyed to his mind resulted in the famous 'The Hebrides' overture, which was completed the following year at Berlin. It is said that after his return home his sisters asked him to tell them something about the Hebrides. 'It cannot be told, only played,' he said, and forthwith seated himself at the piano and played the theme which afterwards grew into the overture.

As the travellers turned their faces towards Tobermory again, Mendelssohn's sea-sickness gradually left him, and he was able to bid defiance to the sea-monsters of the Atlantic, and even to maintain that the 'wet' was rain, and not mist, as Klingemann insisted. They reached Tobermory at seven o'clock in the evening, although they ought to have been at Oban by that time. The captain cast anchor in some corner or other, and they elected to pass the night in the cabin. There were no beds, and they had to make the best they could of the floors. 'Herrings are lodged in spacious halls compared to us,' says Klingemann, and they often chanced to make unknown boots their pillows. 'It was a wild night's revel, without the merry cup, and with rain and wind for the boisterous songsters.' They landed next morning, Sunday, at Oban, still in the rain; and not being desirous of hearing a Gaelic sermon, which, together with the weather, might have been too much for them, they drove on to Inveraray. During the drive, the sun came out and warmed their hearts, and helped them to a more cheerful frame of mind. At Inveraray they found an excellent inn and good quarters; and the smiles of the host's beautiful daughter, with fried fresh herrings and coffee for breakfast, put them at peace with all mankind.

A longing for letters now drove them to Glasgow; they travelled alternately by road and steamboat, via Loch Eck, to the mouth of the Clyde, which mode of progress excited their admiration, as it prevented the journey from getting monotonous. They sailed up the Clyde to Glasgow. This part of the journey also pleased them, firstly, and perhaps mainly, because there were scarcely any waves; from this it may be inferred that the waves of the wild Atlantic had been altogether too much for Mendelssohn; he, like a good many more or less notable people, found more pleasure in looking at them than being on them. The scenery, too, as they sailed up the river struck a sympathetic chord. The

pretty watering-places, the soft corn-fields, and a view of the clear wide distance, greeted them like old friends, after long roaming among the silent mountains.

The 10th of August found Mendelssohn and Klingemann in Glasgow; and although they did not exactly see and conquer, like Cæsar, they saw and admired—very likely through rose-coloured spectacles, for they rested in luxurious idleness in the best hotel in the city. The remembrance of past disasters and bad weather faded away; but it was surely ill-natured on Klingemann's part to say that the Highlands brew nothing but whisky and bad weather.

On the 11th they made their last excursion, to Loch Lomond and the 'rest of the scenery which ought to be published and packed up as supplements to Sir Walter Scott's complete works;' but there is no record of Mendelssohn's impressions in these parts. On Loch Lomond they met with an adventure which might have cut short the days of the musician. Klingemann and he were out on the loch in a rowing-boat in the twilight, when, without the least warning, a squall swooped down on them from the mountains. The boat began to toss about in an alarming fashion, and Mendelssohn prepared to swim for it; but, as he says, with their usual good luck they got safely through. They had to spend the evening in the company of three or four noisy young Englishmen; and ultimately they had to make their way to their bedroom, which was in the next house, with cloaks and umbrellas. The next day they started on their southward journey, passing through Glasgow on their way to Wales.

Mendelssohn's experiences and impressions of the Highlands may be summed up in his own words: 'This, then, is the end of our Highland journey. We have been happy together, have led a merry life, and roved about the country as gaily as if the storm and rain had not existed, but they did exist. We had weather to make the trees and rocks crash. To describe the wretchedness and the comfortless, inhospitable solitude of the country, time and space do not allow; we wandered ten days without meeting a single traveller; what are marked on the map as towns, or at least villages, are a few sheds, huddled together, with one hole for door, window, and chimney, for the entrance and exit of men, beasts, light, and smoke, in which to all questions you get a dry "No," in which brandy is the only beverage known, without church, without street, without gardens, the rooms pitch-dark in broad daylight, children and fowls lying in the same straw, many huts without roofs, many unfinished, with crumbling walls, many ruins of burnt houses; and even these inhabited spots are but sparingly scattered over the country. Now and then you find beautiful parks, but deserted; and broad lakes, but without boats; the roads a solitude. Fancy in all that the rich glowing sunshine, which paints the heath in a thousand divinely warm colours, and then the clouds chasing hither and thither! It is no wonder that the Highlands have been called melancholy. But two fellows have wandered merrily about them, laughed at every opportunity, rhymed and sketched together, growled at one another and at the world when they happened to be vexed

or did not find anything to eat, devoured everything eatable when they did find it, and slept twelve hours every night: these two were we, who will not forget it as long as we live.'

THE POLICEMAN'S STORY.

I AM a Sergeant of Police. Thomas Summers is my name, and fifty-four my official number in the Marlshire County Constabulary. When I joined the Force I was a big, awkward-looking, country Johnny, as strong as a horse, and twice as healthy. Drill soon set me up, and the uniform set me off, so that when I returned to my native village on leave after three years' town duty, the folks hardly knew me. I was as well and as strong as ever, but a lot better-looking—at least so my old mother told me, and of course the hay-seed was pretty well combed out of my hair.

When I went back to Darbury, the town where I was stationed, they changed my beat. Up to then I had always been told off, not for what you'd call exactly low parts of the town, but for streets of little houses, rented by clerks and the better sort of working-men. Very easy beats they were, mostly, though not profitable in the matter of tips; but I was that innocent in those days I hardly thought of tips; and when a chap once gave me sixpence for helping him in at the window when his wife was away, and he'd forgotten the latchkey, I was almost ashamed to take it. The nights were quiet; burglars had more sense than to try it on in houses where they'd have had to take the parlour clock, the canary, all the chimney ornaments, and the master's greatcoat to make up the worth of a five-pound note; and in the daytime, except for boys throwing stones, there wasn't much doing.

When they put me up among the big houses near the Park, it was different. There were gardens to watch, if it was only for tramps sleeping in the outhouses; families away at the seaside leaving me half-a-crown to keep a particular eye on the premises till they came home; pedlars, beggars, and suspicious characters about all day. A chap couldn't go to sleep and do his duty by that beat, I can tell you.

There were compensations, though, and not only in the way of tips. There was more company; servants in all the houses, and parties up to all hours, especially in the winter. Even a cabman, who's out of temper because his fare has been persuaded to stop just half an hour longer, is better than nobody at all to talk to on a cold night, when you're about tired, and wishing the relief would come round, though you know he's not due for a good two hours.

As for the servants, I soon got to know most of them, and a very nice, pleasant, friendly lot of girls they were; but for long enough I never liked one better than another. At last, however,

there came a girl to Mr Town-councillor Johnson's, and she—— But as my story is about her, I may as well begin it with the time I first met her.

She came out through the Councillor's front gate with a dog, a fox-terrier puppy about six inches long, and he began barking and worrying round my boots in a way very creditable to such a young one.

'Excuse me, miss,' I said, just by way of introducing myself; 'that dog's not muzzled.'

'Oh! he won't really bite you, sir,' she replied, laughing.

'Perhaps not,' said I, looking as stern as I could; 'but it's my duty to take him to the station;' and I made a grab at the little beggar as if I really meant it.

'Oh!' she cried, 'surely you wouldn't be so cruel?'

I had been running my eye over her all the time, not exactly professionally, of course; but a police officer, if he knows his duty, gets into the way of reckoning people up pretty quick, and I saw the joke had gone far enough.

'Well, not this time, miss, I won't,' I replied, 'seeing that you're fresh from the country, and perhaps didn't know there was a muzzling order in force here.'

'My!' she exclaimed. 'However did you know I was from the country?' It was written all over her as plain as could be, but it wouldn't have been professional to tell her so.

'What we don't know, isn't worth learning, miss,' I replied, trying to look as wise as a detective in a play. 'Next time you bring that young gentleman out for an airing, put his certificate of birth in your pocket. The order don't apply to dogs under six months old.—Good-morning.'

'Good-morning, sir,' says she, smiling, and dropping a bit of an old-fashioned curtsy, that put me in mind of the girls in our village school; and without another word we parted. We had walked together perhaps fifty yards. I kept straight on, following my beat, and she went round the corner to where there was a pillar-box to post a letter she'd held in her hand all the time. I suppose I fell in love with her there and then, because I kept thinking about her all day, and felt uncommonly glad my mate on the beat was a married man. She was a pretty girl, seemingly about twenty, medium height, fair hair and complexion, dark-blue eyes, pleasant features, figure inclined to plumpness, and was dressed—— But, as this isn't a description of a party who's wanted, how she was dressed doesn't matter.

I saw her nearly every day after that; he's a poor policeman who can't time himself to come round to a particular house when a girl's shaking her mats or doing something that will bring her in sight of the road; but I never managed to exchange more than a smile with her for more than a week. At last, one evening when I was off duty, I met her as she was going down the town.

'It's a nice evening, miss,' I said as she passed me.

She gave a little scream, looked round as if wondering which way to run, and then stared

at me with a please-don't-hurt-me look in her eyes, which died away as she recognised me through my plain clothes.

'Oh! Mr Policeman,' she said, 'I didn't know you at first, and you gave me quite a turn.'

'I'm sorry, Miss—what shall I have the pleasure of calling you?' I asked, thinking it was about time I knew her name.

'Wybrow,' she replied. 'I'm Mary Wybrow. And you?'

'Tom Summers, at your service, Miss Wybrow,' I responded, laying one hand on my heart, and bowing while I lifted my hat with the other. 'And how do you like Darbury?'

'Very well, Mr Summers,' said she. 'That is, what I've seen of it. The people seem kind and good-hearted.'

I wasn't vain enough to take this last remark altogether to myself; but as I was one of the people, it was encouraging. 'It's very good of you to say so,' I said; and then we walked on quietly for a bit.

'I hope I'm not taking you out of your way, Mr Summers?' she remarked just as the silence was getting awkward.

'Your way is mine, if you'll allow it, Miss Wybrow,' I replied.

She didn't say anything, but blushed and looked down, which I took to mean yes, and walked on by her side accordingly.

I need not set down what we said on that walk, or on plenty of others that followed it. She let me keep company with her; and the longer I kept it, the more certain I felt we were just suited to each other; but when I'd made up my mind to ask her plainly what she thought about it, something happened. I was passing Johnson's gate, going dead slow as usual, on the chance of a sight of Mary, when one of her fellow-servants came tearing out in a big hurry and ran smack into me.

'Here, young woman,' I said, catching hold of her arm, 'consider yourself in custody for furious driving.'

'You're wanted in the house,' she replied, having no time to laugh, seemingly. 'There's some things stolen.'

I didn't say anything. When a man's called in on a duty of that sort, the less he says and the more he hears, the better.

'Lots of things,' she ran on. 'The young ladies' jewellery, and I don't know what else.'

We got to the door before she'd time to give me any more particulars; and in the dining-room I found Councillor and Mrs Johnson, their three daughters, my Mary, and the other housemaid—the one who fetched me in was the cook—all looking very solemn.

'Summers,' said the Councillor, who was a bluff and hearty but quick-tempered man, 'members of my family have missed property for some time. My servants have offered to have their boxes searched, and I thought it best to have it done in your presence. I do not accuse or even suspect anybody, you understand.'

'Quite so, sir,' I replied; and we all went up-stairs.

Mrs Johnson and her eldest daughter turned out the boxes, first the cook's, and then the upper housemaid's, and then my Mary's. There was nothing found that shouldn't have been there

till they came to Mary's, and there, wrapped up in a petticoat, were three studs—diamonds, they looked like, but I heard afterwards they weren't real stones.

'Oh Mary,' said Miss Johnson, holding them out on the palm of her hand, 'how could you?'

Mary said nothing, but went as red as fire.

'Where are the other things you have taken, girl?' asked old Johnson sternly.

'I have taken nothing, sir,' said Mary respectfully but firmly.

'Nonsense,' said Johnson impatiently. 'What's the good of saying that, with those studs staring you in the face? Make a clean breast of it, and we'll see what can be done. If you won't, I must hand you over to Summers here.'

'I know nothing about them, sir,' said Mary quietly. She was as pale now as she had been red the moment before. 'I can't think how they came there.'

'You had better say no more,' said Johnson angrily.—'Summers, do your duty.'

I stepped forward and touched Mary on the shoulder. 'Consider yourself in custody,' I stammered out, thinking as I did so how lightly I'd used those very words not half an hour before.

'Oh Tom, save me!' said she, turning round and clinging to me.

'Yes, yes, honey,' I whispered, putting my arm round her. 'Don't lose heart. It will be all right.'

'Summers,' said the Councillor, staring at us, 'what's the meaning of this?'

'Well, sir, Mary and I have been keeping company for some time, and this has come rather sudden,' I explained. 'Don't you be afraid I'll not do my duty, sir, in spite of my private feelings; but—but'—Then I came to a dead stop, not being able to put into words all that was in my mind. I didn't believe my Mary had taken the things, not likely; but, as they had been found in her box, I wasn't sorry her master was going to charge her. It would be bad for her, of course, for a bit; but for getting at the bottom of a thing, give me police-court proceedings, and no hole-and-corner private-inquiry work with he-said and she-said and tittle-tattle taken as sworn evidence.

I had kept a pretty sharp eye on all parties while the search was being made, and I'd got an idea into my head. It was a wild one, and a very little thing had put it there, but there it was, and I meant to see what I could make of it.

'Bless me! Summers,' said old Johnson, 'I had no idea of this. It must be most distressing to you. But come down-stairs again and let us talk things over.' We went down; and he and his wife and Mary and I went into a room by ourselves, for, as he said, there was no need of the others.

'Now, Mary,' said the Councillor, 'once more, what have you to say?'

'Nothing, sir,' persisted Mary. 'I can't understand how those studs came into my box; I never saw them before.'

'Very well,' said he, frowning. 'If you will have it, you must. Summers shall take you to the station in a cab.'

'Beg your pardon, sir,' I put in, 'but I think

we'd better walk. There will be less notice taken of us.'

I wanted more time to talk to her than a cab would have given us, and of course I meant to take care we didn't look like policeman and prisoner on the way.

'As you like, or as she likes, Summers,' said the Councillor.

'A cab, please, Tom,' whispered Mary; but I shook my head, and, though she looked surprised, she said no more. Mrs Johnson fetched her hat and jacket, and we started, having arranged that old Johnson should follow to charge her after he'd made out a list of the missing articles.

'Now Mary, my dear,' I said as soon as we were outside the gate, 'who did it, do you think?'

'I can't guess, Tom,' she replied. 'I only know I didn't.'

'No, dear,' I said. 'I know that, of course. But have you no notion? Are you friendly with the other servants? Have you noticed either of them extra flush of money lately?'

'They have both been very kind to me, Tom,' said she. 'And I know nothing about their money.'

We had to pass the pillar-box where Mary had posted the letter the first day I saw her, and the sight of it brought that letter to my mind, and just for a second my heart went down into my boots.

'Mary,' I said, 'what did you write to Mr Levy about?'

'Mr Levy, Tom?' she repeated, as if the name was quite strange to her. 'I don't know any one called Levy.'

'Wasn't that your own letter you posted the first time I saw you?' I asked.

For a bit she couldn't remember the letter at all, as of course the first sight of me hadn't gone as straight to her heart as the first sight of her had gone to mine; but after I had reminded her of the joke about the little dog, she called it to mind.

'No,' she said. 'Now I remember one of the young ladies gave me that letter to post. But how do you know how it was addressed, and what does it matter?'

'Bless your dear heart,' I replied, fit to jump over the moon with joy, 'I read the address as you held it in your hand; and as for what it matters, right about turn and back to the house, my love, and you'll soon see.'

Then she broke down, and began to cry; but there was no one about, so I let her have her cry out, comforting her as best I could by telling her to keep her heart up, for, if I was on the right tack, they would all be begging her pardon in an hour's time.

When we got back, I asked if I could see Mr Johnson alone, and the first thing he said was that he supposed she had changed her mind and confessed.

'No, sir; it's not that,' I said. 'Do you know that soon after Mary entered your service, one of the members of your family gave her a letter to post, addressed to Levy, the pawnbroker in High Street?'

'No,' said he; 'I didn't know it. But what has that to do with the case in hand, Summers?'

He must have seen what it might have to do

with it as he asked the question, for he went as white as a sheet.

'Well, sir,' I said, 'I don't want to insinuate anything against anybody; but don't you think it would be better to ask a few questions down at Levy's before you go too far to draw back?'

'Perhaps it would,' he said, after he'd sat thinking for about five minutes. 'Can I trust you to ask them, Summers?'

'Certainly you can, sir,' I replied. 'But don't you think you had better go yourself?'

'No,' he said; 'I don't want to hurt your feelings, Summers; but Mary's story about the letter may be false; and even if—if it should turn out that a member of my family has—has had dealings with Levy, justice demands that you and others who heard the girl accused should also know that the accusation is withdrawn. I have no wish to hide anything from you.'

He promised to make it right with the inspector about me leaving the beat, gave me the list he had made out; and off I went, as sure as could be I was right, because the little thing I'd noticed when they searched the boxes was that Miss Johnson was the only one in the room who didn't look surprised when the studs were found.

Old Levy is an honest pawnbroker enough, and his tale was quite straightforward. He'd had dealings with Miss Johnson for months, and she had pawned every one of the things on my list except the studs which were found in Mary's box. She had written to him because she had sprained her ankle a bit at lawn-tennis, and couldn't keep an appointment she'd made, though she wanted five pounds most particularly. He'd sent the money, he told me, and got the security the next time he saw her. He gave me her letter; so I advised him to keep a still tongue in his head—which, being a pawnbroker, he knew how to do—and went back to break the thing gently to old Johnson.

When I showed him the letter, how he did take on, as well he might, having a daughter who could do such a nasty, mean, dirty trick as trying to ruin my poor girl. Taking her sisters' and her mother's jewellery was nothing, compared to trying to hide it in the way she did.

It was hushed up, of course; and what the girl wanted the money for, I never knew. Old Johnson did the right thing when Mary and I were married, which was pretty soon, as she didn't care to stay on after what had happened.

As that's all my story, I'm afraid there isn't much moral to it, except that it proves what I said before—namely, that, when you are falsely accused, the sooner you go before a magistrate the better. How do I make that out? Why, this way. If the case had gone into court, Levy would have come forward as soon as he received the police notice of the missing property; and so, though things would have been more unpleasant for Miss Johnson, Mary would have been right enough. How could she have been cleared without going into court, I should like to know, if she hadn't happened to have a policeman with all his wits about him for a sweetheart? And suppose my mate had been on duty the morning she was given in charge, what then? Why, of course she must have gone before the bench, and they would have discharged her without a stain

on her character. So I think I have good grounds for maintaining that if there is a place where innocence will out, it's a police court, though I'm glad for Mary's sake that I was able to save her from giving a practical proof of the truth of my argument.

FERNLAND.

IN the whole round of the Vegetable Kingdom there are no more beautiful forms of life than Ferns. These lovely children of the shade charm us alike by their graceful forms and exquisite colours. They are universal favourites, and though flowerless, yield us perennial pleasure. The places, too, that they love to beautify with their nodding, delicately cut fronds, are among the most entrancing on our earth's surface. Where the air is musical with the sound of running waters; where the spray of the mountain tarn flashes in the sunbeams; where the shadows of the forest are the deepest, and the soil is the rich mould formed by the leaves of many autumns; on the rock-bound coast where the seagull builds her nest and the eagle has her eyrie—there ferns make their homes.

Ferns ('Filices') stand at the head of the flowerless plant-world which includes the fungi, creeping lichens, equisetæ or horse-tails, and seaweeds. These flowerless plants—Cryptogams, as they are botanically named—are the descendants of the great Carboniferous Flora, of which ferns formed a very important part. It is an interesting fact that of the eight great divisions into which modern botanists divide the Fern family, four were in existence during the Carboniferous period; and of other three, fossilised specimens have been found. Therefore, when we look on a large and representative collection of ferns, we see a fair picture, in miniature, of the great cryptogamic forests, whose remains, in the form of coal, are so valuable to the present age.

The ferns found throughout the world up to the present time have been divided by botanists into about three thousand species. The varieties, or forms varying from the specific type, but not sufficiently to justify placing them in separate species, are, however, innumerable. This tendency to vary is one of the most peculiar characteristics of ferns, and will be referred to further on.

The geographical distribution of ferns is a very interesting study. No other order of plants is so widely distributed. They are met with from the equator to well within the Arctic and Antarctic Circles, and only disappear when we reach the sterile regions of the frigid zones. Some make their homes at the sea-level, others at an altitude of sixteen thousand feet. Some grow in shade so dense that almost no other forms of vegetation exist beside them; others grow in the full glare of the sun. They are found in the crevices of rocks, walls, bridges, and buildings where there is no apparent soil for their sustenance; on the banks of streams with their roots immersed in water, and in bog-lands.

Their sizes and modes of growth are also very varied. Some become trees with fronds twenty feet long; others have fronds measuring only

half an inch. Some creep along the ground and over the faces of rocks; others climb the stems of trees and out on the branches, clothing the trees with their bright foliage like ivy. Some have fronds thick and leathery in substance; others are so delicately thin as to be almost transparent. Some, such as the common harts-tongue, have fronds without divisions; others, such as '*Adiantum gracillimum*,' are cut into hundreds of segments.

The variety of colour in fern fronds is greater than is generally supposed. The shades of green range from the palest to the deepest. Some fronds have three colours. '*Pteris tricolor*,' for example, has midribs of dark red, bordered with white merging into green. Other kinds are beautifully variegated with white, yellowish green, and red. The loveliest colours are found in the young fronds. Some of these soon after opening are of a deep crimson colour, gradually changing as they grow older into the normal green of the variety. Others are bright red, pink of various shades, ruby, brown, blue, and bronzy green.

Ferns attain their greatest size and fullest luxuriance in the tropics. The humid heat and dense shade of the great tropical forests produce a congenial home for them; and they are often found there with stems fifty, sixty, and even one hundred feet high. These huge tree-like ferns belong, as a rule, to one of three genera, the '*Dicksonias*,' '*Alsophilas*,' and '*Cyatheas*.' Specimens of '*Cyathea medularis*' have been found in New Zealand with their stems rising to one hundred feet, and crowned with grand masses of feathery fronds. When they attain such dimensions, ferns become prominent and striking objects in the landscape.

To the tropics belong, also, the lovely and unique fern forms which are popularly known as silver and gold leaved ferns, and which are great favourites in this country for greenhouse decoration. The fronds of these kinds, as a rule, on the under sides are coated with a fine farinose powder which assumes different colours according to the variety. Sometimes the powder is bright golden or pale yellow, white, cream, brown, or blue.

However, tropical ferns must always be of secondary importance to us who live in Britain. The most interesting and useful section to us is that which comprises the species indigenous to our country, and a few foreign species which have been found to be hardy in our climate. In Hardy Fernland we possess inexhaustible stores of beautiful forms. An examination of the splendid collection of hardy ferns in the ferneries of the Royal Gardens at Kew, which contain the largest number, in one group, of our native species, shows that they equal in decorative value their exotic brethren, while possessing the advantages of being perfectly hardy, and consequently more easily cultivated.

There are about fifty distinct species of ferns indigenous to Britain. This seems a small number; but these fifty species are found to produce, both in their wild haunts and when grown under cultivation, an almost infinite number of beautiful variations. No other family of plants shows this tendency to vary to such a surprising extent, and to it we owe many of

our most beautiful kinds. When we examine a good collection of ferns, this characteristic is easily seen. If we take, for instance, the well-known hartstongue (*Scolopendrium vulgare*), we find that there is almost no limit to its eccentricities. One of the foremost authorities on cultivated ferns (Mr J. Birkenhead, of Sale), in a recent lecture thus refers to the astonishing variableness of the hartstongue: 'By imagining every degree of serration, laceration, and cutting up of the frond; every degree of unevenness, from the slightly wavy to the deeply gophered; every degree of roughness of surface, from the perfectly smooth to that like a toad's back; every degree of cresting, from the simple fork to the most complicated tuft; every degree of branching, from one division to that in which the plant is a mass of branches difficult to separate into fronds; fronds drawn out and fronds abruptly terminated; narrow fronds and broad ones; fronds with horns below, others with horns above, others, again, with pockets; fronds bearing bulbils at the edges, and others with young plants on their surfaces; fronds deformed, every one being different from every other on the same plant—in fact, imagine every variation in form beautiful and ugly, and an idea may be obtained of the appearance presented by the thousands of varieties of *Scolopendrium vulgare*.'

The graceful lady-fern (*Athyrium filix-fœmina*), which is so common in our moist woods and shady lanes, is another species which produces many variations from its normal form. The variety named '*Plumosum elegans*' has fronds of pale green cut into minute segments; '*Plumosum multifidum*' has heavy tassels added to the tips of its plume-like fronds; '*Calothrix*' has glossy fronds so minutely divided that when looked at from a short distance it appears like a green mist; *Victorie*, first found wild in Scotland in 1861, and sometimes called the '*Queen of Lady-ferns*,' has fronds two feet long heavily crested at their apices, with narrow segments crossing each other like lattice-work. Other varieties have long, narrow, slender fronds; others, again, have them broad and leaf-like. Our native shield ferns (*Polystichums*) have also given us many beautiful and curious varieties.

The work of raising new varieties, or of searching for them in their wild haunts, has become to many fern-lovers a fascinating one; and the progress already made in this direction has been so marked and gratifying, that we may confidently look for the addition of other gems to our collections.

In connection with the subject of variableness in ferns, it is interesting to note that our noblest and largest indigenous species, the royal fern (*Osmunda regalis*), has been found, so far, to produce only one or two abnormal forms. But this will hardly be regretted by any one who has seen this truly majestic fern in its favourite habitats.

The majority of British ferns are deciduous in their wild haunts, the first severe frosts of winter blighting their tender fronds. But this is amply compensated for by the rich tints many of them assume in their dying hours. The common bracken (*Pteris aquilina*) is a fine example of this change in colour. Its leaves assume in early

winter every shade of ochre, sienna, and even lake, changing as they die into deep brown. Our artists have paid a high tribute to the beauty of this noble native of British Fernland by introducing it into the foregrounds of some of their loveliest woodland scenes.

When grown under careful cultivation, however, a large number of our native ferns become evergreen—that is, they throw up young fronds before the old ones are faded.

To those who have shaded spots in their gardens, and especially to those whose gardens are situated in smoky districts, we commend the culture of a few hardy ferns. They will grow luxuriantly in an atmosphere and in light in which most flowering plants would languish and die. We often see in towns and cities attenuated specimens of the geranium, fuchsia, and other similar plants, making their surroundings more depressing by their sickly growth. These, with much advantage to their owners, might be discarded, and their places occupied by a selection of our indigenous ferns, which would brighten the spots at every season.

In the ornamentation of public parks and gardens, also, our native ferns should be much more largely used than they now are. In these places, except in very favourable positions, it is almost impossible to get flowering plants to grow in a satisfactory way, and the little success which is attained is got by means of an altogether disproportionate amount of care and expense.

Fernland has no bright flowers to show us, yet there is no class of plants that gives us more continuous pleasure. Roses, orchids, begonias, and other plants which produce flowers with brilliant colours, delight us only during their blooming seasons. At other times they cannot be said to be attractive. But ferns are always beautiful, and in a condition to give us lovely fronds to heighten the charms of the flowers that are in bloom.

NOCTURNE.

NIGHT broodeth still o'er land and sea,
And silently
The silver moon her quiet radiance sheds,
Upon the bosom of the deep
Her quivering beams are rocked to sleep,
Until the Night with joyous Morning weds.

Across the yellow reach of sand,
On either hand
Creep the slow waters softly murmuring;
The moonlight falls in glittering bars
Upon their breast, the watching stars
Gaze downward on the wave-crests, wondering.

A tangled mesh of seaweed floats
Among the boats
That idly rock upon the sleeping tide,
And farther, where the flood is deep,
The salmon-meshes ebb and sweep
Among the darkling shadows far and wide.

THE FIRST STEAMER TO CROSS THE ATLANTIC.

IN many quarters the idea seems still to prevail—and we gave expression to it quite recently in an article on 'Some Early Steamships' (page 155)—that the first steamer to cross the Atlantic was the 'Savannah,' which in 1819 made the voyage from the port of the same name in Georgia to Liverpool in twenty-five days. The 'Savannah,' however, was not a steamship, and was under sail more than two-thirds of the way across. She was a full-rigged packet-ship, and had on her deck a small steam-engine, by means of which motion was given to the craft in smooth water when the wind failed. The log is full of such entries as: 'At 8 A.M. tacked ship to the westward;' 'Took in the mizzen and foretop-gallant sails;' 'Got the steam up, and it came on to blow fresh—we took wheels in on deck in thirty minutes;' 'Stopped wheels to clean the clinkers out of the furnace;' 'Started wheels,' and so on.

In 1838—as stated in the article on 'Early Steamships' already referred to—the 'Sirius' and the 'Great Western' successfully made the journey from England to America; but five years before that date, Canadian enterprise accomplished the feat of bridging the Atlantic Ocean with a little vessel propelled wholly by steam. This was the 'Royal William,' whose beautiful model was exhibited at the British Naval Exhibition in London, where she attracted the attention and curiosity of the first seamen in the empire. The 'Royal William'—named in honour of the reigning sovereign—was built in the city of Quebec by a Scotchman, James Goudie, who had served his time and learned his art at Greenock. The keel was laid in the autumn of 1830; and her builder, then in his twenty-second year, writes: 'As I had the drawings and the form of the ship, at the time a novelty in construction, it devolved upon me to lay off and expand the draft to its full dimensions on the floor of the loft, where I made several alterations in the lines as improvements.

The steamship being duly commenced, the work progressed rapidly; and in May following, was duly launched, and before a large concourse of people was christened the "Royal William." She was then taken to Montreal to have her engines, where I continued to superintend the finishing of the cabins and deck-work. When completed, she had her trial trip, which proved quite satisfactory. Being late in the season before being completed, she only made a few trips to Halifax.'

The launching of this steamer was a great event in Quebec. The Governor-general, Lord Aylmer, and his wife were present, the latter giving the vessel her name. Military bands supplied the music, and the shipping in the harbour was gay with bunting. The city itself wore a holiday look. The 'Royal William,' propelled by steam alone, traded between Quebec and Halifax. While at the last-named place, she attracted the notice of Mr Samuel Cunard, afterwards Sir Samuel, the founder of the great trans-continental line which bears his name. It is said that the 'Royal William' convinced him that steam was the coming force for ocean navigation. He asked many questions about her, took down the answers in his note-book, and subsequently became a large stock-holder in the craft.

The cholera of 1832 paralysed business in Canada, and trade was at a stand-still for a time. Like other enterprises at this date, the 'Royal William' experienced reverses, and she was doomed to be sold at sheriff's sale. Some Quebec gentlemen bought her in, and resolved to send her to England to be sold. In 1823 the eventful voyage to Britain was made successfully, and without mishap of any kind. The 'Royal William's' proportions were as follows: Builder's measurement, 1370 tons; steamboat measurement, as per Act of Parliament, 830 tons; length of keel, 146 feet; length of deck from head to taffrail, 176 feet; breadth of beam inside the paddle-boxes, 29 feet 4 inches; outside, 43 feet 10 inches; depth of hold, 17 feet 9 inches. On

the 4th of August 1833, commanded by Captain John McDougall, she left Quebec, via Pictou, Nova Scotia, for London, under steam, at five o'clock in the morning. She made the passage in twenty-five days. Her supply of coal was 254 chaldrons, or over 330 tons. Her captain wrote: 'She is justly entitled to be considered the first steamer that crossed the Atlantic by steam, having steamed the whole way across.'

About the end of September 1833, the 'Royal William' was disposed of for ten thousand pounds sterling, and chartered to the Portuguese Government to take out troops for Dom Pedro's service. Portugal was asked to purchase her for the navy; but the admiral of the fleet, not thinking well of the scheme, declined to entertain the proposition. Captain McDougall was master of the steamer all this time. He returned with her to London with invalids and disbanded Portuguese soldiers, and laid her up off Deptford Victualling Office. In July, orders came to fit out the 'Royal William' to run between Oporto and Lisbon. One trip was made between these ports, and also a trip to Cadiz for specie for the Portuguese Government.

On his return to Lisbon, Captain McDougall was ordered to sell the steamer to the Spanish Government, through Don Evanston Castor da Perez, then the Spanish ambassador to the court of Lisbon. The transaction was completed on the 10th of September 1834, when the 'Royal William' became the 'Ysabel Segunda,' and the first war-steamer the Spaniards ever possessed. She was ordered to the north coast of Spain against Don Carlos. Captain McDougall accepted the rank and pay of a Commander, and, by special proviso, was guaranteed six hundred pounds sterling per annum, and the contract to supply the squadron with provisions from Lisbon. The 'Ysabel Segunda' proceeded to the north coast; and about the latter part of 1834, she returned to Gravesend, to be delivered up to the British Government, to be converted into a war-steamer at the Imperial Dockyard. The crew and officers were transferred to the 'Royal Tar,' chartered and armed as a war-steamer, with six long thirty-two pounders, and named the 'Reyna Gobernadora,' the name intended for the 'City of Edinburgh' steamer, which was chartered to form part of the squadron. When completed, she relieved the 'Royal Tar,' and took her name.

In his interesting letter, from which these facts are drawn, to Robert Christie, the Canadian historian, Captain McDougall thus completes the story of the pioneer Atlantic steamer: 'The "Ysabel Segunda," when completed at Sheerness Dockyard, took out General Alava, the Spanish ambassador, and General Evans and most of his staff officers, to Saint Andero, and afterwards to St Sebastian, having hoisted the Commodore's broad pennant again at Saint Andero; and was afterwards employed in cruising between that port and Fuente Arabia, and acting in concert with the Legion against Don Carlos until the time of their service expired in 1837. She was then sent to Portsmouth with a part of those discharged from the service, and from thence she was taken to London, and detained in the City Canal by Commodore Henry until the claims

of the officers and crew on the Spanish Government were settled, which was ultimately accomplished by bills, and the officers and crew discharged from the Spanish service about the latter end of 1837, and "Ysabel Segunda" delivered up to the Spanish ambassador, and after having her engines repaired, returned to Spain, and was soon afterwards sent to Bordeaux, in France, to have the hull repaired. But on being surveyed, it was found that the timbers were so much decayed, that it was decided to build a new vessel to receive the engines, which was built there, and called by the same name, and now [1853] forms one of the royal steam-navy of Spain, while her predecessor was converted into a hulk at Bordeaux.'

This, in brief, is the history of the steamer which played so important a rôle in the maritime annals of Canada, England, and Spain. Her model is safely stored in the rooms of the Literary and Historical Society of Quebec, where it is an object of profound veneration. At the request of the Government, a copy of the model has been made, and will form part of the Canadian exhibit to the World's Fair at Chicago this year.

THE BURDEN OF ISABEL.*

CHAPTER XXV.—ISABEL'S PROGRESS.

'FORTUNATE,' says the old wise man, 'is the country that has no annals;' but fortunate is *not* the story that has no incident. 'Emotion in action' must be the maxim of the story-teller, even as it is of the dramatist; emotion, therefore, that is unexpressed in action is scarcely tangible enough material for the novelist or dramatist to deal with; it is fitter for the treatment of the rhapsodist or philosopher. Yet there are periods in otherwise active lives that are charged merely with ordinary feeling and desire, with growing knowledge and experience: what is he who undertakes to tell the story of these lives to make of such periods? He finds it hard to write about them, except in such a way as makes the reader inclined to skip them; and yet they are of the greatest importance: they are like the pools or quiet stretches of water in the course of a stream, which reflect heaven and seem as deep as the foundations of the earth, and which give volume and force to the next sweep and rush and swirl of current.

Isabel had now entered upon one of these periods. The six weeks or so of holiday which she allowed herself passed quickly and pleasantly with baths in the sea, walks to Kirk Braddan and over Douglas Head, drives over high, breezy moorland to Sulby Glen, Peel, Ramsey, Port St Mary, and Port Erin; and sea-trips now in the *Sea-mew* and now in the *Swiftsure*; for George came regularly on the Friday afternoon in his yacht, and returned on the Monday morning. He was persistent in his desire and demand for races with Lord Clitheroe's yacht, and was loud in his resolve to put new and powerful engines in his own, to make it the swiftest thing that moved in water. Isabel was compelled to be interested in him and his doings, and, considering his pre-

* Copyright reserved in the United States of America.

tensions towards her, to study him with intention. She found him boyish, if not boisterous, in manner, like a lad escaped for a holiday; with a strong appreciation of the substantial fare of life, of all things that can be bought with cash or a cheque; with fine physical health, and a sturdy confidence in his own judgment; affectionate, but scarcely deferential, to his father, whom he plainly considered somewhat old-fashioned, and whom he called 'dud.' Thus George appeared to Isabel, and she was not sure whether she liked the presentment; on the whole, she thought she did not, and she frequently found herself, before she was aware, making George stand in her mind beside Alan Ainsworth. She wondered if George had just developed those qualities and characteristics which now marked him, or if he had always had them and she merely had not noticed them; but if he had shown them, must she not have noticed them? She concluded that the high position of importance and responsibility to which his father had recently raised him had brought out more strongly qualities which had always been his. But, it must be said, George did not force the study of himself upon her. He talked with her, laughed with her, and was generally attentive to her, but he did not notoriously seek her company; and, after the one small outburst which I have recorded, he did not say anything to her that was charged with special feeling—all which piqued her somewhat; for she was a woman, and no woman—not even a sensible and clear-seeing girl like Isabel—likes a man who pretends to be overwhelmingly in love with her to behave as if he were indifferent, however indifferent she herself may be.

Thus pleasantly and quickly passed the days and weeks till the middle of September, when the whole party said farewell to the Isle of Man. It was only at the last moment of adieu that George showed he still had a memory.

'When,' said he, 'shall we meet again, Bell? Shall I come to town at Christmas, or will you come north? A year,' he added, 'will be a terribly long time'—with clear allusion to the year and a day which were to date them the previous Whitsuntide.

The Suffields, as well as Isabel and her father, returned to London; for there was to be an autumn session of Parliament, and a kind of half or veiled season of society. The session did not actually begin till the second week of October, until which time Lord Clitheroe went shooting. It was a kind of open secret that with the re-assembling of Parliament his engagement to Euphemia should be formally recognised, and there was something of a flutter in the family accordingly.

What with these matters and her own arrangements for settling down to the enjoyment of her wealth in proper form, Isabel was fully occupied for two or three weeks after her return to London. She went back to her old lodgings in the Marylebone Road for a little while—she declined, though invited, to go to Rutland Gate with her father—until she had found a flat and bought enough furniture to enter upon its occupation. Her final 'good-bye' to Mrs Wiffin was affecting. Isabel kissed her and thanked her for all her solicitude in the past.

'Oh, my dear,' said Mrs Wiffin, crying a little,

'you might have been my own daughter, I liked you so well. And thankful I am that nothing but good luck has come to you under my roof. But, oh, the world is full of snares and viles, and I hope that now you won't get into any of them, if it ain't presumptuous in me to say so. And you'll come and see me sometimes.'

Isabel had found for herself a delightful flat—or, at least, a flat which she intended to make delightful—in a block in Cromwell Road. The more substantial and necessary furniture she had, of course, to acquire at once to render it merely habitable; but such things as would make it a pleasant place to live in she set herself to seek out, to select and buy by degrees. It was, and continued to be for months, a minor harmonic joy of her daily existence to journey into strange regions of London and visit the unlikely shops in her quest for treasures of one kind and another. She found, for instance, a fine Japanese Buddha in bronze in a marine dealer's in the East End; a finely carved Chinese table in ebony and ivory in an old curiosity shop in Lambeth; and a beautiful Teniers in a picture-shop in Hammer-smith. Nor did she disdain to look at the more pretentious and dearer wares of the shops of Regent Street, Piccadilly, and Bond Street. She took her father with her on these expeditions, on the pretence of putting herself under his protection; and he was immensely pleased with his responsibility, although, invariably, when active care or decision had to be shown, as in crossing a street or calling a cab, it was his daughter that was to the fore.

At the same time she was not forgetting her scheme for the benefit of Aged Governesses. She did not begin with the display of a prospectus and a subscription list: she intended that the institution should be all her own; she even thought that for the present she would dispense with the aid of her proposed Committee of Gentlemen; for she was shy of discussing her plans with any one, and she wished to be, if she could contrive it, merely a kind of beneficent daughter to a few of those who had grown old, gray, and lonely in the thankless occupation to which she herself had given the spring of her days. The formality of the ordinary charitable institution, with its painfully regular habits and rules, with its generally barrack-like existence, she abhorred; such arrangements she resolved she would not have for her Aged: they would make them feel too much as if they themselves were now put to school; they would, she was sure, be resented in secret, and she knew that dislike of what you should appear grateful for tends to create a hideous, hypocritical temper. Therefore, her regulations would be loose and elastic; her Aged should feel comfortable and at home; and to that end—and also because her income would not bear the expense of a large institution—she took a modest and cheerful house in Chelsea, sufficient to accommodate some ten persons, and no more. She intended that her *protégées* should do the light work of the household themselves—it would do them good to be occupied a little in that way; and she believed—judging by herself—that they would like to be so occupied—and therefore she introduced no great establishment of servants. She herself would be the governing head of the household; and her resident deputy was to be Miss

Brown, the Aged governess who had been the friend of her youth in the Yorkshire school to which her aunt had sent her.

She carried her arrangements through so unhesitatingly that by the beginning of November she had five Aged vestals, including Miss Brown, established in the Chelsea house; and since her own abode was also now in a fairly presentable condition, and since her friends and relations had been for some time asking her when she was going to begin to receive visitors, she determined to give a 'house-warming' on the day dedicated to the memory of Guy Fawkes.

Her dining-room was not large enough to entertain a numerous company. The party at dinner made only an octave, but it was a harmonious octave: Isabel and her father—Alexander had respectfully declined the invitation: feasts and large gatherings, he said, did not agree with his constitution, and, moreover, he had no raiment splendid enough to do her honour—her uncle and aunt, Phemy and Lord Clitheroe, Ainsworth and Miss Brown; Miss Brown's charges, the Aged vestals, were coming in later in their best ancient bibs and tuckers.

'You might have asked a young woman, my dear,' whispered Mrs Sutfield to her niece, 'to meet Mr Ainsworth—Miss Bruno, the novelist, for instance. Miss Brown may be nice and intellectual, but she is scarcely the person to set a young man down with.'

'I didn't think of that!' said Isabel. Could it be, she wondered, that Mr Ainsworth might desire and take pleasure in the society of a young woman?—a young woman other than herself, that is? It smote her with a strange pang that he might.

Yet Mr Ainsworth found great pleasure in sitting next to Miss Brown, who was one of those old maids that make us wonder at the perversity and stupidity of men in choosing mates. She had probably never been asked in marriage; yet it would have been difficult for a man to find a woman who would have been a wiser, tenderer, or more cheerful companion through life. She had never been handsome: she was little, thin, and dry, but there was about her a suggestion of past pleasantness of face and figure such as resides in a Normandy pippin. She had intellect and vivacity, and such an array of learning, and withal so much modesty in the display of it, as put Ainsworth to shame. She knew the works of French authors through and through—it was she who had given Isabel her taste for the literature of France—and she had known Frederic Lemaître—who had taught her elocution—and the great Dumas. She told Ainsworth strange and vivacious stories of these two worthies, to his immense delight and benefit. She discussed French plays with him, and Ainsworth was moved to confide to her the secret that he was trying to write a play. Then she ventured to express to him decided and well-matured opinions of how a play was to be made, and advised him to study Sardou for construction and Labiche for good-nature.

'What a perfect treasure—a *thesaurus*!—your Miss Brown is!' exclaimed Ainsworth to Isabel, when they had all returned to the drawing-room. 'She ought to be editing a Review instead of supervising your Aged!'

'Yes,' said Isabel mischievously, 'she knows all about plays too—doesn't she?—and can advise about the making of them.'

'Yes; she can!' said Ainsworth with a fine blush.

'And she is so charming and versatile,' added Isabel, 'that she can win the confidence of an ambitious dramatist at their first meeting!'

Ainsworth considered her closely a moment: 'Did she tell you?'

'Tell me what?'

'That I had confided to her that I am writing a play?'

'Oh no. I heard you tell her. And,' said she, with an involuntary touch of pique, 'I thought it a little odd that I should not have heard of it before. I—used to hear all you were doing,' she was about to add, but she refrained.

'I meant to keep the matter secret,' said he. 'But indeed it is not much of a secret: I am only trying: I shall very likely fail.'

She was silent; and he was silent—though he looked at her as if he would speak. He had it in his mind to confess that he had made a secret of the writing of the play, because he meant it as a means of raising him to her level: he was resolved to win her, but he would only ask her to put her hand in his when he was in a position equal, or almost equal, to hers; and for a writing man to attain such a position in these days he believed the stage was the only gangway. But he did not say that; he said something else instead.

'You remember,' said he with a tender smile, 'those strange lines I heard your father murmur when I went to bring him from that opium-place?—"Raynor of gold and jewels; Raynor of silver and pearls!"—I often think of them, and wonder if your father had a vision of your coming wealth—saw that you were going to be a Rancee. "Raynor?" In your case it ought to be "*Reine d'or*." I think we must call you *Reine d'or*—queen of gold.'

'That comes,' said Isabel, 'of talking so much about French things with Miss Brown. But,' she added, taking his persillage with unusual seriousness, 'why are you always talking of my gold?—why does my wealth dwell so in your mind? Is that not a little vulgar? Forgive my saying so. But has my poor wealth made any difference in me? Am I not the same to my friends as I have always been? I wish to be! I hope I am!'

'You are, you are, Miss Raynor!' assuaged Ainsworth. 'You are always generous and frank and good! It is vulgar, of course, to consider wealth too much; but—I cannot help thinking of it. Forgive me. I need your forgiveness and your indulgence!'

'Try,' said she, seriously, 'to think I am as I was; and let us say no more about it.'

They were then driven apart by the influx of after-dinner guests, among whom were the Aged in their best raiment. That was a proud evening for them; for not only were they there on an equal footing with such people as they had been wont to serve and to cringe a little to—wealthy people, and people of title, like Lord Clitheroe and his mother Lady Padilham—but they actually saw in the flesh some artists and authors of whom they had hitherto only heard. Their crowning triumph, however, was when one of themselves—

the versatile Miss Brown—at the request of their hostess and protectress, rose and recited in the most laughably dramatic manner—she had been taught by an eminent French actor—a French 'piece' ('Le Curé de Cucugnan' of M. Alphonse Daudet)—recited it with so beautiful a French accent that those who understood French applauded with extreme enthusiasm; and those who did not understand applauded as much as those who did, so that they might not be considered slack in good manners nor backward in education.

They came, and they went; and at midnight Isabel sat again alone in her drawing-room—her father had gone to his room an hour before. Her house had been warmed by the friendly breath of thirty or forty relations, friends, and acquaintances; she might now reckon herself established as a person of some consequence; but, as she looked round the room, and thought who had sat here and who there, and how flat and unsatisfactory it had all been, she found herself recalling with especial delight those summer evenings not so very long ago when Ainsworth would drop into her Marylebone lodgings and straightway plunge into talk of great books and great things—talk into the rush and swirl of which she also would be caught, while Alexander would sit by with the air of a philosopher whose knowledge of the matters being discussed was too deep for words. Those days were gone, and they were better than these!

THE SENSE OF SIGHT IN ANIMALS.

IN discussing the senses of animals, Sight brings us to a difficult part of our subject, because, as even plants are sensitive to light, it is not always easy to know whether the lower animals simply have a similar sensitiveness, or are actually able to see: probably many can only distinguish light from darkness; such may be the function of the eye-spots which occur in quite low organisms.

True vision—the forming of an image on the retina or by mosaic vision—most likely only occurs in the higher forms of creation. There are quite eyeless creatures, for example, earth-worms, which yet in some way are aware not only of light, but even of light of different colours, preferring red to blue. Probably the whole surface of their skin is sensitive. This curious skin-sensitiveness is still further proved by some facts given in a recent book entitled *The Colours of Animals*, where Mr Poulton describes some experiments he has made, extending over several years, on the variable colouring of insects. One year he experimented on no fewer than seven hundred larvae of one kind of butterfly alone (the peacock, which appears to be one of the most sensitive), placing them in different coloured surroundings. These larvae produced pupæ of almost every colour, from black to light gray and very golden, passing on into white, the colours corresponding very closely to that of their immediate surroundings. Even when the larvae were blinded, and the surroundings subsequently changed, the colour changed correspondingly—thus proving that vision is not necessary, but that the whole surface of the skin

must be sensitive, not only to light, but to changes of colour. Mr Poulton is still continuing these experiments, and communicated some further results he has obtained to the Edinburgh meeting of the British Association in 1892.

Molluscs have eyes: some in their tentacles, some between the feelers, or on a stalk at the side or the back; but with most, as with the snail, the eye merely appears to distinguish light from darkness; the cuttle-fish, however, is an exception—it has a highly developed eye, and probably good vision. Another mollusc, the onchidium, a kind of slug, is also more advanced than most others of its kind; for it has two kinds of eyes, one kind like that of other molluscs, and the other like man's; the latter are very numerous (from twelve to one hundred) all over the back. The nautilus has a very exceptional eye; there is, in fact, no similar eye known in Nature: it is simplicity itself, although the nautilus in other ways is a highly developed mollusc. It has none of the parts of an eye with which we are familiar, but is simply a small round space, the surface of which is just like the skin around, only that there is a minute pin-hole in it. Through this hole the sea-water enters and fills the globe of the eye, bathing the retina, over which are spread the fibres of the optic nerve. Possibly this was the original, primitive form of the eye; but in all other molluscs the cavity is closed and more or less filled by a lens.

Many of the lower creatures possess the remarkable power of renewing lost members, and even sensory organs: for example, if the eyes of the garden snail be cut off, they are soon reproduced quite as perfect in structure as they originally were. They also appear to be renewable an indefinite number of times; for on one unfortunate snail this experiment was repeated twenty times, and the eyes were renewed as often, the last eye being as good as the first! The snail's eyes are on its hinder and longer horn or tentacle; but it appears unable to see any object farther away than a quarter of an inch. It is said that a glow-worm can distinguish large letters at a distance of ten or more feet; and even fine lines only two hundredths of an inch apart when they are not more than half an inch distant.

Amongst crustacea there is a great difference in the organ of sight: it ranges from a simple eye-spot in some species up to two compound eyes on a movable eye-stalk (as in the crab and lobster) with complete optical apparatus. Some have both simple and compound eyes—which we shall describe more in detail directly—but usually only the latter, and if the former are also present, there are only two or three. Shore and land crabs are quite equal to most insects in their rapidity of perception. In some minute crustacea, the eyes are so large that the little creatures appear to be all eye.

The sight of insects has been made a special study, and there is no doubt that all can see, with the exception of a few living in subterranean caves, or burrows, who have lost this power. Most insects have two kinds of eyes: the large compound eye—one on each side of the head; and the ocelli or simple eyes, of which there are generally three, placed in a triangle between the other two. As a rule, the ocelli merely consist

of a lens, behind which is a gelatinous liquid, composed of transparent cells, and behind this the retina, in which are a number of the so-called 'rods.' The compound eyes are more complex: the surface is generally divided into hexagons, each of which is called a facet, and usually forms a lens; or we may call the compound eyes six-sided eye-masses; beneath each facet is a cone, the farther end of which is surrounded by cells, in which is a nerve-rod in connection with the fibres of the optic nerve. Whether this organ forms one aggregate eye, or whether each facet is an eye, is not known. The latter, however, seems improbable, for a queen-bee has nearly five thousand of these facets, a worker-bee six thousand, and a drone eight thousand; the house-fly about the same; while moths have eleven or twelve thousand; butterflies seventeen thousand; and some beetles as many as twenty-five thousand facets. If each cone behind these numerous facets makes a separate image, it is very difficult to understand how so many separate images can be combined. It is more probable that insects see by light passing through the facets on to the cones at the back, and so to the nerve-fibres; each cone receiving only a very small portion; hence insects' vision would be a mosaic—a series of minute pictures, larger and wider, the larger the eye, smaller and more distinct when the facets are small and numerous. This theory, though still disputed, seems now almost established by the recent researches of Exner and Watase.

However this may be, it is probable that the ocellus only distinguishes light from darkness, while the compound eye forms images; for the ocellus may be covered over without affecting the insect's movements, whereas, when the compound eyes are covered, the insect behaves as if in the dark, hitting against objects and flying against walls, &c. For nocturnal insects, it is a great advantage to have so many images superposed, while the pigment being mobile, may act as a screen to cut off too much light. If the compound eye of an insect is removed and freed from the pigment or colouring matter, objects may be seen through it from behind; but the field of vision is very small.

A scorpion, though it can boast of six eyes, has very imperfect vision: if approached noiselessly, it can easily be captured, and seems quite unaware of the presence of flies or other prey until they move.

The facets in the compound eye of an ant vary in number from nothing up to twelve hundred. The ocelli vary too; there are never more than three, sometimes only one, and in some workers none at all. Mr Bates, in his *Naturalist on the Amazon*, mentions one kind of ant found there, called the Saüba ant, which, besides having the usual three classes—the males, females, and workers (leaf-carriers, &c.)—that other ants have, has also three kinds of workers, one set living wholly underground, and only to be seen by disturbing the nest. They then emerge in alarm from their burrows, and are seen to have very large heads, not smooth like other workers, but covered with hairs; and in the middle of the forehead is a twin ocellus or simple eye, the usual compound eyes being at the sides of the head. This curious frontal eye is not known in any other kind of

ant, and the appearance of these strange creatures reminds one, says Mr Bates, of the Cyclopes of Homeric fame. One species of ant has not the usual compound eye, the organ of sight simply consisting of one lens. Another nearly blind species, living in dark places and tunnels, has deep-set eyes; another none, though the eye-sockets are visible; another, again, has neither eyes nor sockets: these latter live and move wholly under covered roads or tunnels of their own building.

A small organ in our brains—the size of a hazel nut, and called from its shape the pineal gland—is considered by some to have once been a rudimentary eye! This rudimentary eye is found in all vertebrates and in some fossils; it probably was once a real third organ of vision; so apparently the vertebrates had once a central eye. By-and-by we shall be finding that all these wonderful old myths had a foundation in fact.

Curiously enough, many insects have a visual field of half a sphere, owing to the convex form of the eye, so that they can see objects partly behind and at the side as well as in front of them; so can a chameleon. It is, however, very difficult to say what and how much insects see; probably they can only see objects that are very near, the distance of about a millimetre, or one-twenty-fifth of an inch, being that at which they can see best. To a wasp, the distance of twenty feet corresponds to what one hundred and sixty feet would be to a man. The colour-sense of insects we shall refer to subsequently.

Spiders, which must no longer be called insects, have six or eight ocelli, arranged in a pattern on the top of their heads, but they have no compound eye at all, and are very short-sighted; probably they cannot see at a greater distance than four inches. They are easily deceived by artificial flies; will try their utmost to eat cork or india-rubber when it is placed on the web, and can even be repeatedly deceived in this way without learning wisdom. In another case, after a female spider had laid its eggs and rolled them into a ball, this ball was moved just two inches away, and the unhappy spider was not only unable to find it, but spent nearly two hours looking for it. She scarcely seemed able to see it even at the distance of half an inch. Nor do they know their own bags of eggs from other bags. They will continue carrying these bags about even when all the eggs have been removed and replaced by a piece of lead! Yet some spiders at all events can see their prey and can distinguish colours; and either by sight or some other means can find and will readily drink drops of water scattered about. In one species the eyes of the male are near the top of a long, slender footstalk—perhaps to aid in the search for females; but practically, their sense of sight is almost absent, and, as we have seen, they are decidedly stupid.

Many reptiles depend for their food upon the accuracy of their sight; if a chameleon is watched while catching insects, its unerring aim cannot but be noticed, though its range of vision is probably limited. A chameleon has, however, the curious property of being able to move its two eyes independently of each other, so that one can be looking up and the other down, or one behind

and the other in front. At the same time, its eyelids also form a second pupil, as it were, to the eye; so that it has curious properties, although it has been disrespectfully likened to a boiled pea with an ink-spot.

The eyes of deep-sea fish are very varied: some have neither eyes nor sight; others have greatly enlarged eyeballs, so as to catch the least glimpse of light. Their eyes tend either to disappear or to be unusually efficient; but since no trace of sunlight can penetrate to any great depth, and it is probably quite dark beyond a depth of some two hundred fathoms, of what use can eyes be? Fish have been captured at a depth of nearly three thousand fathoms, where there must be not only absolute stillness, but also total darkness—except for the fact that some of these deep-sea creatures are phosphorescent, and therefore luminous. This fact was first ascertained in the *Challenger* expedition. Since then, Mr Alcock of the Indian Marine Survey has found that some deep-sea crustaceans have a similar power, one large prawn quite lighting up a bucketful of water in which it was placed. Fish with large eyes have therefore a better chance of finding food (and mates); but they cannot wholly depend upon sight, since some have quite abandoned all attempts to see. Some, again, have luminous organs on their head or body or tail, which are under their control, so that they can actually throw light at pleasure on their prey or extinguish it in times of danger. Thus the Angler, amongst others, attracts its prey by means of these coloured lures or phosphorescent lights. It has been well said that these 'vast profundities of the deep have become a sort of almshouse or asylum, whereunto antiquated forms have retired, and amid the changeless environment, have dwelt for ages unaltered.'

As is well known, the eyes of flat-fish—plaice, soles, &c.—are both on one side of the head. This is not, however, the case when these fish are born; originally, like the majority of us, they have an eye on each side of the head; but when they give up swimming about, and lie in hiding on one side at the bottom of the sea, the eye on the under side would be useless; it therefore gradually travels round the head till it is near the other eye, on the coloured side, which is directed toward the light. On the whole, fish have very large eyes, but not very keen sight, although they can perceive their prey or danger; one very odd-looking tropical fish, that walks on its front fins, is much above the average in the way of sight: this is doubtless necessary for its existence, since insects form its prey. Many fish, however, have an accurate vision for objects near at hand, as may be seen in the way they discover shrimps or other food when almost buried; but few appear able to see objects at a greater distance than four feet in the water, and about three feet upwards. A man standing fifteen feet away can be seen by some; but, owing to the refractive power of water, he would doubtless be greatly magnified. The pupils of a fish's eye do not, as a rule, alter in size with the changes in intensity of the light; and in many, a change in the size of the eyelids marks the changes of the seasons; in some, the eyelids become so fat in the spawning season as almost to hide the eye! Some sharks and a few of the lower mammals have a third

eyelid or nictitating membrane, principally of use to clean the eyeball.

Birds have very acute vision; perhaps the most acute of any creature, and the sense is also more widely diffused over the retina than is the case with man; consequently, a bird can see sideways as well as objects in front of it. A bird sees—showing great uneasiness in consequence—a hawk long before it is visible to man; so, too, fowls and pigeons find minute scraps of food, distinguishing them from what appear to us exactly similar pieces of earth or gravel. Young chickens are also able to find their own food—knowing its position and how distant it is—as soon as they are hatched; whereas a child only very gradually learns either to see or to understand the distance of objects. Several birds—apparently the young of all those that nest on the ground—can see quite well directly they come out of the shell; but the young of birds that nest in trees or on rocks are born blind, and have to be fed.

Burrowing rodents, such as rats and squirrels, as we might expect, and also insectivores (moles, &c.), have a very rudimentary organ of sight. The walrus has not good sight either; at all events, out of the water it seems unable to see a man even when he is just in front of it, though it has keen enough hearing, and could smell him one thousand feet away, if to windward. When startled, the walrus rotates its eyes without moving its head, which gives it a very odd expression. Monkeys, as we should expect, have sight more like our own, and readily distinguish colour. In one instance, sugar-candy of various colours was provided for them; they invariably chose green first—perhaps because it was more like their usual herbaceous food—and then white; no other colours were touched till these were all eaten.

It is, however, hardly necessary to speak of the sense of sight in the higher animals, as it is so much like our own, except to notice that few of them depend so much upon this sense as we do. This is very observable with cats and dogs, who, though they have keen sight, yet rely far more upon their senses of hearing and of smell. In most mammals and the higher vertebrates, as with ourselves, the eye consists of parts admitting light and concentrating it on an expansion of the optic nerve which lines the back of the eyeball; sometimes one layer of tissue is modified into a coloured and light-reflecting surface.

THE SACRED BEETLE.

CHAPTER III.

THE following morning—or, rather, I should say, that morning—Dr Carl von Eberstein appeared at the breakfast table with a very worn and haggard face indeed. 'Looks as if he'd been on the spree for a week!' murmured the Masher to Mrs Parson. But, to his discomfiture, that lady eyed the youth from head to foot with a scornful glance, and said in reply: 'I daresay you know all about how a gentleman looks when he has been, as you so elegantly term it, "on the spree for a week." I call it a most interesting pallor, which improves his always good-looking countenance.' (Her husband stared at her, a potato harpooned on his fork, making various blind and ineffectual

shots at his mouth with it.) 'A-hem! Dr von Eberstein, I trust your zeal for midnight exploration has not ended in giving you a cold?' This drew all eyes on our hero, who blushed and looked uncomfortable.

'Oh no, madam; I am quite well, I thank you; only a little tired.' And he applied himself afresh to his breakfast.

'Dear me! now I come to look at him, *what* a nice face Dr Eberstein has,' murmured Miss Priscilla Jenkins to her sister, Miss Hester.

'If you hadn't been half blind,' answered that lady snappishly—for she had a short temper—'you'd have seen that long ago. *I* did.'

'Well, sister, you needn't bite my nose off, if you did.'

'Just as well I shouldn't,' replied the snappish one; 'it's short enough already.'

Poor Miss Priscilla was in an agony lest the Doctor should have overheard this little rebuke; but she could not help looking up from her plate now and again and thinking to herself: 'Dear me! where *could* my eyes have been? He is certainly wonderfully handsome.' And then she blushed for shame at her thoughts.

Strangely enough, the very same idea was passing through the fair Miss Emerson's mind. It is never wise to speculate on the thoughts of ladies, for they are such incomprehensible creatures, that it is quite impossible to guess in what groove their ideas may be running. The young lady, with a most demure and saintly look on her face, has just finished sewing up the sleeves of her brother's friend's smoking-jacket, or has probably carefully deposited a sharp-pointed pebble in the young man's slipper, and is now dreaming of more mischief. It is as impossible to guess what the feminine cogitations are as it is to catch a butterfly with a railway engine. Miss Emerson, therefore, though, to all seeming, intent on roast fowl, was saying to herself: 'Now, that is the sort of man I should like to marry, if I ever do commit myself so far. So tall and well built; such an open, honest countenance; and oh! what lovely eyes!'

'Dear me! what had come to all the ladies? All the men were aware that the Doctor had never been singled out in this fashion before. But the climax was reached when Mrs Parson, who had usually spoken of our hero as a member of 'one of those horrid German universities where they do nothing but smoke and guzzle beer from morning to night!'—when she actually, with a smile on her countenance, to which it had been a stranger for many a long day, said in dulcet tones as the party rose from the table: 'My dear Doctor, *would* you lend me your arm for a little stroll on the bank? I should so like to ask you your opinion on some of these dear delightful antiquities we see daily.'

Every one stared, the Parson most of all. The Masher turned aside to hide a grin; and the luckless and bewildered young man addressed answered hurriedly: 'With much pleasure, madam.' And the two departed, leaving the Parson staring in vacant amaze after his wife.

The other ladies fluttered into their cabins headonbless, various sensations in their minds; with t, short, ugly Mr Cotton muttered to the a twi: 'Anged if hi see anythin' so wonderful eyes b chap! A long-legged, German lout like fronta!

that! Wot's come over all these women-folk hof a sudden—hey?'

But the Masher was watching the Parson's face, on which were legibly imprinted virtuous horror, amazement, and indignation at the extraordinary behaviour of the wife of his bosom.

Mr Cotton retired into the cabin which he jointly occupied with the Doctor, dismissed the subject from his mind, and scanned the money article of the latest 'Times.' The Masher went on deck for a smoke; and the Parson was left, staring round the cabin in vacant bewilderment.

'To describe what that unfortunate Von Eberstein went through during his conferences with Mrs Parson,' said Colonel Merritt to me when relating this truly veracious story, 'is impossible. He tried to tell me; but what with his wrath and genuine astonishment at her conduct, and the roars of laughter with which I received his confidence, he couldn't explain himself. It was the richest joke I ever heard!'

When the Professor came on board again, the Parson, who from the deck had watched their approach in horrified silence as he saw Mrs Parson hanging affectionately on the Professor's arm, and looking up tenderly into his eyes—the Parson stepped forward, bestowed a laughty scowl on the unfortunate young man, and, addressing his wife, said: 'My dear, please come down-stairs; I wish to speak to you.' She waved a farewell to her late escort and vanished, leaving poor Von Eberstein rooted to the deck.

'Now, my friend,' said he, turning to the Masher, who was simply roaring with laughter, 'will you kindly tell me what is the meaning of all this, if you can?'

'If I can!' responded the Ornament. 'Why, my dear fellow, she's gone mashed on you! Why, I don't know; but it seems to me, from what I saw at breakfast, that *all* the ladies are in the same box. Ask yourself: *I* don't know why!' And he wiped his eyes, having for once enjoyed a good laugh.

The Professor stood silent for a few moments; then he strolled forward, filled and lit his pipe, and began anew to examine his trophy, which he carried in his waistcoat pocket.

Meanwhile, there was gnashing of teeth in the Parson's cabin. Let us draw a veil over it, for charity's sake.

Dr von Eberstein had not been seated in the bows of the boat for more than ten minutes, when a soft step made him look up. There stood Miss Priscilla Jenkins, with a most maidenly smirk on her faded lips. 'Dr Eberstein,' she said in a lackadaisical voice, 'do you know I do really feel so ill; I wonder what is the matter with me? It is a kind of faintness. I should be so obliged if you would prescribe for me.'

'By all means, Miss Jenkins,' replied the kind-hearted and unsuspecting Doctor, taking her wrist in his. As he did so, he happened to look up, and he espied the Masher, watching him with a broad grin and shaking his finger at him. He dropped the wrist like a hot potato. 'I think if you go and lie down for a while the feeling you complain of may pass off. I will see you again at dinner.'

'Oh, thank you so much!' replied the guile-

less maiden, and she tripped away, leaving Von Eberstein in a cold perspiration of mingled fright and indignation.

'What—what is the meaning of all this?' he exclaimed. At this moment the head of Miss Hester Jenkins appeared at the companion. She glanced round, and then began to approach him. 'This is too much!' exclaimed the unhappy man, who sprang up and hastened towards the plank which led ashore, meaning to seek safety in flight. To effect this, however, he had to pass the lady, which he was doing with a bow, when she stopped him:

'Oh, Dr von Eberstein, I wished to ask you'—

'Another time, my dear madam; I am really in haste. I find I shall miss the chance of seeing a most interesting antiquity if I do not hurry.'

'But just a moment'—

'Positively, I shall be too late if I wait. An revoir, madam;' and he sprang ashore and hurried off. As he did so, he turned, and saw a face pressed against one of the cabin windows, evidently watching him. It was Miss Emerson's!

Miss Jenkins looked after him, feeling inclined to be angry, but presently her features relaxed. 'It is impossible to be angry with such eyes,' she murmured; and she retired to her cabin.

When the Professor returned that evening, he found himself, to his great annoyance, overwhelmed with the same embarrassing attentions, and he didn't like it. But he didn't at all mind when he looked up from his plate and saw Miss Emerson's pretty brown eyes bent upon him with an unmistakable expression of interest lurking in them, and lowered in confusion when they met his glance of admiration. That was quite another thing, and the sensation was decidedly pleasant.

They were now on their homeward journey, and would disembark the following day. The Professor was glad of it. He had become sick and weary of the gross and fulsome adulation the ladies of the party seemed inclined to bestow on him. He had devoted himself assiduously to Miss Emerson, at first to escape from the other women, but afterwards with a genuine feeling of respect and admiration, which had quickly ripened into love. And, on her part, Miss Emerson seemed inclined to reciprocate the sentiment. On this last evening, when they had gone to dress for dinner, Von Eberstein had abstractedly hung up his waistcoat without taking out his precious box. As he left the cabin, Mr Cotton hurried in to make his toilet. He had often seen the Professor take something out of his waistcoat pocket and pore over it, and with the curiosity of a little mind, had longed to know what it was. But though he had often examined the pocket, he had found nothing. There hung the identical waistcoat.

'It's last night,' said he; 'blowed hif I don't hexamine it hagain.' He did—and found the box! Hastily he opened it. 'Nothin' but one o' them cussed stinkin' beetles!' said he, in disgust. 'Wonder how a feller can carry such things about with 'im!' But here he heard the dinner coming. In his haste, he shoved the box into his own pocket and ran out to take his place.

That night, to the astonishment of the men, and also the delight of the Doctor, who was thereby freed from the usual attentions, the three elder ladies made a deliberate set at Mr Cotton. They complimented him on his improved looks; they teased him gently; they exercised all their fascinations upon the delighted man, who pulled up his collar, shot his cuffs, and literally bathed himself in feminine smiles. The Parson, who had given up his wife in despair, and was congratulating himself that the trip was just over, and she would come to her senses when 'that German fellow' was gone, was thunder-struck at this new movement of hers, and could only stare round the table, dumb and open-mouthed. 'The depravity of *her* flirting—she! a rector's wife! And at her age! Oh, pooh! it's impossible!' But it wasn't! There she was, before his face, making eyes at this low, underbred little man—ugly too! and, wonder of wonders, the Misses Jenkins following suit.

He had not a syllable to say for himself. The others all enjoyed themselves in their own way. The Professor made desperate love to Miss Emerson, who seemed to like it; the Masher surveyed the scene from the profundity of his shirt-collar, and chuckled delightedly at the changes which, dolphin-like, passed over the Parson's face; and the three ladies plied the enraptured Mr Cotton with compliments and flowery phrases, which so delighted him that he misplaced and dropped more aspirates than ever. And over all, the Reverend brooded like a thunder-cloud, gloomy and threatening.

And thus passed their last evening on board.

TWO DAYS IN CAPE CORSE.

THE innkeeper of Corte had called me at four A.M. that I might catch the morning train for Bastia. He was a Florentine, inordinately proud of the names in his visitors' book, and with the meanest cuisine in the world; and he had in vain tried to argue me into an ascent of Monte Rotondo, which would entail my return to his hotel for another day or two. But I was in no humour for Monte Rotondo. To begin with, it was the month of May; and the season was late. There was a terrible amount of snow on the mountain. One knew this by induction; for the lower peaks, not much more than a third as high as Monte Rotondo, still glistened with their white mantles.

There were other reasons why I turned my back on Monte Rotondo and proposed to hurry to Bastia. Perhaps not the least of them was the desire to leave as quickly as possible an island which, from all accounts, was still, in the year 1890, nearly as full of bandits as a boar. It seemed incredible; yet there can be no doubt that Corsica was and is retrograding in certain respects. And although the Corsican bandit does not lay himself out for the capture of travelling foreigners, who could say how soon he might find the temptation irresistible? The man who shoots one human being after another in vendetta with as little repugnance as you or I would shoot a partridge, may be expected after a time to become callous about other of the Commandments. And I for one felt unambitious of such adventures as might be the lot of the Englishman in bonds to bandits

among the bleak mountain-tops of the green isle of Corsica.

Though too early in the year for the high peaks, it was by no means too early for that interesting yet very little visited promontory to the north of Corsica which protrudes itself from the main island like the spike of a sword-fish. Moreover, the Cape Corsicans, as the inhabitants of this headland are called, have a reputation for thrift and sobriety which makes them despised by their more lazy and happy-go-lucky brethren of the interior. The inference was that they retained less of that taste for bloodshed which certainly characterises the average Corsican now, as in past times. It seemed unlikely, therefore, that I should here be thought worth seizing and holding for a ransom which my friends at home might think a preposterously high estimate of the value of my life.

The weather had been dull to the last degree during the previous week. Storm after storm from the south-west—the fiercest quarter for Corsica—had broken upon the land, and tumbled the waves of the Mediterranean into Ajaccio's lovely bay so as to make even the Ajaccioti a little impatient and disposed to marvel. It was equally wild in Corte. The high white and black houses of this quaint old fortress-town were all blotched with damp and mould. The rivers Restonica and Tavignano, which meet under its castle rock, rushed surgingly towards their goal on the eastern shore. And only now and again, at sunset and sunrise, was there any break in the black clouds over the mountains which in the west and south frame Pasquale Paoli's town so engagingly.

Under these conditions of the atmosphere, I travelled towards Bastia on a chilly May morning, hoping for better things, upon the strength of a divinely rosy flush which had glowed upon Rotondo's snow at the hour of our departure. For companions I had an old gentleman with a gun, and a young hearty priest with thick curly hair and an ingenuous expression. The priest talked without ceasing; and the old gentleman fingered his gun and uttered the laconic phrases, 'Eh! già! Ah! Ebbene! Sacro Dio!' one after the other; as much, it appeared, in extreme weariness of his companion's loquacity as for the sake of any encouragement it might give him to continue to talk. Anon, however, at a wayside station the priest departed, and, to the amazement of my Protestant eyes, was straightway received into the arms of two stout country-women who awaited him on the platform. They took him in their arms one after the other, his bag and his bundle, his umbrella, rosary, and prayer-book, and embraced him, with many a sounding salute upon the cheek, until, with some difficulty and haste, he fought himself free of them, and stood at arm's-length, blushing like a poppy. I daresay they were his mother and an aunt or foster-mother.

At Bastia the sky was blue, and the sun shone gaily upon the multitude of white tombs which, after the Corsican fashion, dot the hill-sides like bijou country residences. It appeared that the bad weather was left behind. And so, indisposed to lose time, straightway I went from the railway to the *Hôtel de France*, and thence, having breakfasted with appetite upon the excellent trout of

the island and the fair wine, I walked with my knapsack to the diligence office for the Cape Corse townlets, and in a trice had engaged the *coupe*. In less than an hour after entering the old capital of the island, I was being eddied along through the dust of the high-road in the worst, most dilapidated, and most tedious of public conveyances in which it had yet been my misfortune to travel. A large widow with an asthma sat by my side for a few minutes. She was a genial conversational soul, and we were soon upon such an intimacy that I received an invitation to visit her upon my return to Bastia, and was informed of the amount of the savings of her son, who chanced to be in the postal service of the Argentine Republic at Buenos Ayres. When the widow went, I was alone in the lumbering car for hours, with all the dust of the highway for company.

The journey by diligence began at 10.30 A.M. and lasted until 8 P.M. Morsiglia was to be my resting-place; and so I did not leave the diligence until Morsiglia was reached. In the meantime, I had learned the physiognomy of Cape Corse by heart, save that of the mountains, which pervade it in the middle like a vertebra. The road is cut out of the rocky cliffs of the coast-line, and white villages nestling by the calm blue sea were passed one after another. Now and again, however, the prospects were of a broader kind. We came to spacious glens and valleys which broke upon the shore from the inland mountains. Through the midst of the cornfields and vineyards, olive woods and chestnut forests of these lateral rifts, attractive brooks of fresh water purled their way to the Mediterranean.

Some very happy days may be spent with the rod and gun in Corsica; and none will be remembered more brightly than those devoted to Cape Corse. The entire promontory is hardly twenty miles long by an average breadth of six or seven miles. Yet it has scenery and attractions of many kinds within its compass: mountains five thousand feet high; townlets and villages on the hill-sides and in the valleys; fruit famous for its excellence; wine unmatched elsewhere in Corsica; wild-boar and partridge among its thick perfumed herby scrub; fish in its pellucid streams, and the sea, which is never far away; and the most vivacious of Corsica's cities at its point of juncture with the body of the island.

We rested awhile at the Marina of the town of Luri—five miles up a valley and built on the mountain sides—and the Marina of Rogliano. Then we climbed with terrible tardiness into the mountains to reach Rogliano itself, the chief town of the cape. It is gloriously situated at the head of an amphitheatre of mountains, with a deep valley beneath it opening towards the sea, and teeming with woods and gardens. The town was in gala dress: triumphal arches and mottoes of welcome everywhere; and the people themselves in their sleekest black, and the dumsels in silk. The new Prefect of Corsica had in the course of his tour of the island arrived at Rogliano and been received by the notables and feasted. You would think that people living in the midst of such beauty must of necessity have beautiful natures—be generous, gentle, and unselfish. It is not quite so, however; for Rogliano furnishes

its due and more of the rogues charged with murder and other heinous crimes at the assizes of Bastia.

From Rogliano, the drive was by one rounded upland hill-side after another towards the west coast of the cape. We passed the lighthouse of the extremity to the right. The road made prodigious detours with the curves of the deeply-dimpled slopes. It was a treeless region. The shrubs, however, were thick everywhere; and sweet was the perfume of them as the evening dew distilled their essences.

Thus we ambled by Ersu, the northernmost village, which we saw hundreds of feet beneath us; and Centuri, to which we descended for the convenience of a distinguished native and his sister, who were gracious enough to invite me into their house, and make mention of free accommodation for the night. But to this civil offer I was proof, though it was tendered in all sincerity; and so, amid a profusion of bows and good wishes—the latter from the lady, I rejoice to say, and bestowed in the most cordial manner—I resumed my seat, and we clambered back to the high-road for the last stage of the day.

It was full time the journey was over. The sun, fiery as a tomato, had gone below the horizon line of the sea. The headlands of the coast, north and south, were paling fast. With remarkable suddenness, the air had chilled, and taken a clammy turn that was not very agreeable. I was dead-tired, what with the extraordinary length of my day—beginning as it did at sunrise—the dire jolts of the last ten hours, the aching of my battered bones, and the comparative lightness of my stomach. And so I rejoiced when in the uncertain gloaming the conductor pointed to some houses in front, with a brace of crenellated citadels of the time of Genoa in their midst, and introduced me to the outskirts of Morsiglia. It was well he gave me this information when he did. For no sooner had we come to a heavy stand-still in front of the post-office in the little market-place, than a score or two of the populace beset the poor man with demands for this thing and that, which he had been bidden to buy or get for them in Bastia or *en route*. It was a scene to turn the head of a mathematician. Some blamed him roundly for neglect; others rated him for misinterpretation of their demands. And there was such a riotous chatter from the more contented ones, who examined their parcels before the public eye and the stars, that none would have heeded me unless I had set myself explicitly to shout them all. I smoked another cigarette, and watched them all with interest, until the storm had subsided. Only then did I request directions to the wayside inn of a humble kind which I had been told might be found in Morsiglia.

My bill for bed and board in this little village 'at the back of the world' was two francs and a half. It may be imagined, therefore, that it receives few visitors. Indeed, as a matter of fact it has no inn. The little boy who was bidden to guide me to the house led me through the village and out on to the hill-side until we came to a single white dwelling all shuttered and barred for the night. This was the residence of the road inspector of the district, who, it appeared, played the part of hotel-keeper. On this occasion,

however, he and his wife were both abed; and it was only after considerable parleying that I induced their son to receive me. He gave me a supper of eggs and cheese and indifferent wine, and showed me to a guest-room that would not have been amiss in the *Hotel Metropole*.

The next day opened magnificently, with a cloudless sky and a glare on the sea which proclaimed the sun. The road inspector was up and curious to see his guest. So cordial was he when I professed myself well content with the poverty of his welcome, that he volunteered to be my guide for a journey afoot across the mountains back to Luri, whence I could take the return diligence to Bastia. It was a *festa* day, and thus he was at liberty to take his pleasure. 'Moreover,' he observed, with kindly emphasis, 'understand that I do not do it for money. I go with you as a friend.'

A cup of coffee and a raw egg were princely nutriment upon which to begin one of the most delightful walks I have ever made. It was a joy to breathe the balmy air, a mixture of the scent of many an herb, orange blossoms, the tang of the salt sea, and the morning freshness. We strode along the high-road, therefore, with happiness exuding at every pore, my friend averring that the exercise was pure pleasure to him. We soon left Morsiglia behind; it was lost at the bend of the first headland. But there was compensation in the glorious panorama of Corsica's central peaks, the snow of which seemed to tread the blue of the heavens. The coast-line of the north was also visible right along to Calvi, the ancient little town which boldly claims Columbus for a son. The pale gray of the various capes edged the southern sea to the horizon line.

We kept to the high-road for a few miles, and then, with the Tower of Seneca in front of us, struck steeply upon the herby hills. The Tower of Seneca is a stout ruin upon a mountain top, where tradition says Nero's tutor passed his years of exile in Corsica. It is in this part of the Cape that the sportsman may hope to have a fair day's shooting. The brushwood is, however, so dense that there is small temptation for any but the most robust of hunters to continue long on the track of the Cape Corsican boar. As for the horses, which one may hire here for two or three francs a day, they would be perfectly useless anywhere except on the high-roads and byways.

One wonders to see how these hills of the cape are left wholly to Nature. It is due partly to the native indolence of the Corsicans, who despise manual labour, and partly to the comparatively sparse population. 'Hands are lacking,' said my friend the road inspector, with an instructive heave of the shoulder. Besides, the soil is very thin, and the substratum of limestone, hornblende, and granite is not very attractive to the agriculturist. Thus the outer hill-slopes of the Cape are generally destitute of dwellings and gardens, whereas the valleys and defiles are well peopled.

From the watershed at the base of Seneca's Tower we looked at length again upon the valley of Luri, which is reckoned the most enchanting spot of the Cape. The day before, I had seen it from its base on the eastern side. Now I was at its summit in the west; and the white houses of its different hamlets—all called Luri—set in the midst of chestnut woods in their fairest greenery,

were at my feet. The blackbirds and linnets in the trees were in vigorous song as we descended at a smart pace through these beautiful little woods. Our pace, indeed, was such that the pangs of thirst begun to be troublesome, in spite, too, of the shade of the chestnuts. But my guide would not allow me to have recourse to the brooks which fell from high springs on both sides of us. 'Water,' he said sagely, 'is a poor drink, and not very wholesome.' Moreover, I was to taste the Muscat of Luri, a wine of repute.

Down, therefore, to the first convenient house, entering it over the dunghap contiguous to the front door. It was a poverty-stricken hovel, though so white and tolerably assuming outside. A pitcher and a chair were almost the only articles of furniture in its reception room, the ceiling of which was black with smoke, and the floor populous with fleas. But the Muscat was speedily brought forth. It had been pressed by the naked feet of the tawny woman who offered it to us, and was worth but a penny or so the litre. I have drunk better wine, but none that seemed more delicious. The good dispenser of it was mightily pleased it was appreciated; and it was only after much argument that she could be persuaded to take half a franc as an acknowledgment of its excellence. They are not mercenary in Cape Corse; and as often as not a money offer is rejected—with some spirit.

Luri is quite a considerable village, with two hotels, some swelling municipal buildings, and rather a large church, containing nothing worth seeing. The citizens were pacing solemnly up and down their streets under the faded arches with which they in their turn had greeted the Prefect; and attired in their festival clothes. They flung us civil inquiries as we passed them on our way down the valley, with orange groves and vineyards on both sides of the road. This is especially a famous region for citrons, the trees of which were as odorous as the oranges.

It was yet only eleven o'clock when we arrived at the Marina of Luri, and the rendezvous for the Bastia diligences. Our walk of about fourteen miles had been as brisk as it was lovely. Certainly, it will not be easy to forget.

Let me, in conclusion, give my readers the bill of fare of a meal at a franc and a half which awaited us at the little inn of the Marina. It will sufficiently show that Cape Corse is unsophisticated, and quite a land for the tourist who is out at elbows. There was wine *ad libitum*, of course. The meal began with *hors-d'œuvre* of Corsican sausage, radishes, and olives. Soup à la *bouillabaisse* followed. Lamb cutlets, a Corsican stew of beef, potatoes, and artichokes, cheese, pastry, and coffee, with uncooked broad beans for dessert, were the concluding stages of an eccentric but excellent feast. Nor was the company less excellent. My guide and I sat with various peasants of the district, who were as polite as courtiers; and a certain gentleman and lady, Cape Corsican to the bone; and we were all waited upon by a handsome maid, who was as civil with her smiles as were my companions in speech.

An hour later I gave my friend the road inspector a strong shake of the hand and mounted by the driver of the diligence. The worthy man waved his hat to me until I was tired of contort-

ing myself to look back at him. He had consented to accept a trio of francs, after all; but I verily believe it was rather to satisfy me than for the good of his own pocket.

Cape Corse is a district to revisit. I venture to recommend it to the traveller in Corsica. Hurried as was my own view of it, it sufficed to put me on the best of terms with the land and its people.

PROVIDENCE COTTAGE.

AN EPISODE.

By G. B. BURNIN.

"PROVIDENCE Cottage," Mrs Pringle, ma'am, it shall be,' said Captain Sol Buddle firmly, as he passed his huge cup for another cup of tea, and wiped his forehead with a red bandana handkerchief.

'Well, Captain,' said Mrs Pringle, in tones of amiable acquiescence, 'you being a scholar, and having book-learning moreover, it isn't for me to gainsay you.'

'Mrs Pringle, ma'am,' said the Captain, emphatically rapping his spectacle case on the table, 'your sentiments do you honour. When a man comes to my time of life'—

Mrs Pringle made a little deprecatory movement of her pretty fat hand.

The Captain smiled, well pleased. 'Ah, Mrs Pringle, ma'am, that's the poetry oozing out of you; you're chockfull of it. I say when a man comes to my time of life'—

'Only forty-five, Captain Buddle,' softly suggested Mrs Pringle.

The Captain bowed courteously. 'Not being used to the society of amiable ladies like yourself, Mrs Pringle, I don't quite know how to undecieve you as to my years.'

He paused, a piece of buttered toast in his hand, and looked round Mrs Pringle's cosy sitting-room, warm with the heat of a glowing sea-coal fire. Also, his thoughts went back to the society of various nautical ladies he had known whose manners lacked the repose which distinguished Mrs Pringle's.

Mrs Pringle also paused, teapot in hand, to cast a pensive glance at the gallant sailor opposite.

Outside, tumultuous waves beat noisily against the shingly shore, as if insisting that Captain Sol Buddle should be delivered up to them; inside, the only sound which broke the stillness was a pensive mew from Mrs Pringle's Persian cat. The Captain paused again, took up the cat, and thoughtfully poured out some milk for it. 'My cat on board the "Morning Star" would never take his milk without a spoonful of grog in it,' he said reminiscently; 'but he tried to do too much for his strength: he was always ambitious, that cat was—too ambitious. Laid himself out to eat up all the ship's cockroaches, though he knew they disagreed with him; and there was a funeral soon after—his funeral. He took a lot of cockroaches with him, too—as many as he could hold, poor chap.' Captain Buddle heaved a sigh to the memory of his departed favourite.—'As to my years,' he resumed, 'they'—

The quiet Mrs Pringle, who was not much given to interruptions, did a most unusual thing—she interrupted the Captain again—for the

third time. 'A man is as young as he looks,' she said. 'And you, Captain Buddle, don't look a day over forty-five.'

The Captain again bowed with nautical grace. 'Seeing you've set your mind on it, Mrs Pringle, we'll make it so; though, if any questions are asked, the facts will go against it.'

'No one will be so impertinent,' said Mrs Pringle, as she looked pensively down at her pretty slipper.

The Captain passed his cup for more tea, a beverage to which he had lately taken a great fancy: its novelty appealed to him most strongly. In his seafaring days at this hour—like the departed cat—he had generally partaken of a soothing beverage with rum in it. But the widow had gradually weaned the Captain from such an unlady-like beverage as rum in the daytime, and he found ever fresh delight in tea—tea with cream in it—tea by the bucket—tea containing four lumps of sugar to each supply. At ten o'clock every night, however, the widow's fair hands brewed her lodger what he was facetiously wont to call 'a stiff nor'-wester.' Then, the Captain sat thoughtfully by the fire, living his voyages over again, and full of simple, reverent thankfulness that he had been spared to drift into such a pleasant haven of peace.

Mrs Pringle continued to knit, as the cat drowsily purred on the Captain's knee. The Captain put down his cup and took up the plan of a very snug, two-storeyed cottage, with a veranda running all round it. "Providence Cottage," it shall be, Mrs Pringle; and he looked about for a pipe spill.

Mrs Pringle handed him one with something of a sigh.

'For more than six months,' said the Captain, meditatively drawing a long breath, and carefully using his little finger for a tobacco-stopper—'for more than six months I've been laid up in port, so to speak, and yet in sight and smell of the sea.'

'Yes, you can certainly smell it,' said Mrs Pringle dubiously. 'And when the fishing-boats come in, it's a little bit—eh strong.'

'Well,' said the Captain admiringly, 'a trifle, maybe, for a delicate lady's nose like yours, Mrs Pringle; but there's not an unpleasant flavour about it to a man who's spent his life in communion, so to speak, with such smells. Why, every port has a different smell, and you get to know the lay of the land by it long before you drop anchor.'

'Aren't you tired of the sight of the sea?' somewhat inconsequently asked Mrs Pringle, again filling the Captain's cup, which was blue and white, with 'A Present from Ventnor' on it in bold, clear characters of green. Mrs Pringle lived about a mile beyond Ventnor in a snug little cottage, whose garden ran down to the sea.

'No, ma'am, I ain't,' returned the Captain meditatively. 'Cause why, Mrs Pringle? The sea gets into a man's blood and heart and brain. When he goes down to the sea in ships, likewise fishing-smacks, it's because he's drawn to it, so to speak. He can't help it. The wonders of the deep are always wonders to him, though he's seen them all his days; the harvest of the sea—its dead men's bones, its coral caves, where, saving your presence, those fish-tailed hussies, the mer-

maids, sit waiting for you with deceitful murmurings and delusive songs—is afore him ever in the night-watches; every wind that blows, every whale that spouts, is known to him almost as well as its Creator.'

Mrs Pringle shuddered. 'It's a cruel, treacherous thing,' she said—'a cruel, treacherous thing. I sometimes wake at nights and draw the clothes over my head to shut out the noise. It makes me shudder, and yet I can't leave it.'

'You're right, Mrs Pringle,' said the Captain, drawing his chair a little closer to her—'you're right. It is a cruel, treacherous thing, with its changing winds and hungry, foaming waves, its never-resting, never-ending ebb and flow, its little baby ripples and soft surface a-shining in the sun. And then, when you slide down into it just to feel its soft touch, why, as like as not,' continued the Captain, rather ashamed of his oratorical flight—'why, as like as not, there's a shark waiting to grab and drag you down to Davy Jones's locker.'

Mrs Pringle looked frightened, so the Captain hastened to reassure her. 'It's a wonderful place is the sea, Mrs Pringle, such a lot of spare room in it for rubbish. I should like to take two or three of these contractors who've sent in estimates for Providence Cottage and dump 'em down into Port Royal harbour, so that Port Royal Tom could just open his jaws and contract for them. One would think I was going to build a palace instead of a tidy little six-roomed cottage.'

'Ah, but the masterful way in which you rule and direct them, Captain Buddle!' said Mrs Pringle admiringly. 'You've a natural gift for the ruling of men.'

'Maybe,' said the Captain pleasantly; 'but that's a different thing from the ruling of women, Mrs Pringle. You can't clinch any little difference of opinion with a handspike when you're arguing with lovely woman. You've got to keep your hand on the helm all the time and not let her know it.'

'Yes,' rejoined Mrs Pringle thoughtfully; 'women like a strong, masterful hand that'll guide them; but they won't be driven.'

The Captain shifted himself in his chair. Suddenly it dawned upon him that the matter might be one capable of personal interpretation. He had never tried his hand in that direction. It seemed to him that the howling wind outside, as it blew among the unfinished rafters of Providence Cottage, was jeering at him for his lack of skill in the direction of the fair sex. He stirred his tea and took another lump of sugar.

And the widow, too, thought of many things in her quiet, gentle way as she sat by her side of the fire. Captain Buddle, with his wonderful flow of language and quaint descriptive power, had been a great source of comfort to the amiable Mrs Pringle. And now in a couple of months Providence Cottage would be finished and the Captain cease to remain her lodger. How kind he had been when, that 'land-shark' of a coal-man tried to cheat her out of a sack of coals! The Captain, albeit a man of peace, had knocked the fraudulent coal-man into the middle of the cellar, and refused to allow him to depart until he put his head through the circular opening and humbly apologised. It was something to have

a great, strong, gentle—the Captain was always wonderfully gentle to her—sailor about the premises. Ah, well, she would take her nephew Jack and his pretty bride, Polly Humphreys, to live with her until they had saved enough money to buy a house—no thrifty fisherman at Ventnor ever married before he had bought a house—and try to forget the Captain's pleasant ways. Then she remembered that Jack was a little uncertain in his temper, and that the Captain was, except when unjustifiably roused by fraudulent coal-men, as mild as a lamb.

Suddenly, Captain Buddle rose from his chair and crossed over to Mrs Pringle's side of the room. 'Mrs Pringle, ma'am,' he said, and his flow of language seemed to have returned to him—'Mrs Pringle, ma'am, what would you think of a man who was safe in port if he ventured out to sea again in a new craft—a craft that might be lopsided and cranky, with shifting ballast, given likewise to shipping bilge-water—there was a touch of real pathos in his voice as he drew this touching picture—'and maybe that wouldn't answer her helm?—what would you think of such a man if he was to leave his snug bunk in port and go drifting up and down a-steerin' all over the points of the compass generally?'

'I should think of him whatever you thought of him, Captain Buddle,' said Mrs Pringle. 'It is not for me to set my opinion against that of a sea-faring gentleman like yourself. But if the man you speak of is the man I take him to be, then—'

'Then what, Mrs Pringle, ma'am?' eagerly inquired the Captain.

'He—he would stop in his bunk in port, as you nautical gentlemen say,' returned Mrs Pringle.

The Captain's face glowed with excitement. He took up the plans of Providence Cottage to cast them in the fire. Mrs Pringle gently stayed his hand. 'What are you doing?' she asked.

'Mrs Pringle, ma'am, I'm going to commit these plans to the flames,' said the Captain, 'unless you'll let me give 'em to Jack and Polly.'

'W-what?'

'Yes, Mrs Pringle, ma'am, I am that lubber,' said the Captain, with repressed excitement. 'Why should I go building a house like Providence Cottage, when my Providence is here! This is my port; and if so be you'll allow me to cast anchor and stay here'—

'In command?' queried Mrs Pringle, scarce knowing what she said.

The Captain took her hand. 'No, Mrs Pringle; but as first-officer, with *you* in command, and Providence and the cat to swab decks.'

'Ye-es,' said Mrs Pringle; and the Captain, forgetting the cat, kissed her.

The cat walked out of the room, her tail stiff with indignation.

Outside, the wind howled dismally among the brickwork of the partially completed Providence Cottage. Ten o'clock struck as the widow brought out her family Bible, and Prudence Pemberton, the maid, sat coyly down on the edge of a chair just inside the parlour door.

The Captain opened the Bible reverently. 'Now, we'll have our sailing orders for to-morrow,' he said.

Mrs Pringle laid aside her knitting, looked at

the Captain with tearful eyes, and placed his spectacles on the open Bible, thus tacitly taking command of that goodly mariner, Captain Sol Buddle, who put on the spectacles and somewhat laboriously began to read.

A NEW PHASE OF THE PEARL-SHELL INDUSTRY.

To Mr Saville-Kent, a Queensland Commissioner of Fisheries, is due the credit of a discovery which may revolutionise the Pearl-shell Industry in the Southern Seas. That official has been making experiments with the pearl-oyster for some years, and has lately proved to his own satisfaction and that of his Government, that the valuable mother-of-pearl bivalve can be transplanted and cultivated.

To cultivate the pearl-shell has been the desire of centuries. The oyster has been carried from lagoon to lagoon, from island to island; but though land and water were as good as in its original abode, it perished when transported. Long before white men tried it, the island natives and the aborigines of the Australian mainland worked at the problem. Not only was the fish good to eat and the pearl a lustrous ornament, but out of the shell they made knives and goblets and countless objects of utility and beauty; and consequently its propagation was everywhere desired. It abounded in places difficult of access, in places dangerous of access, and in waters where enemies were numerous; while, where all was favourable, a live oyster was not seen in the memory of man. The intellect even of a barbarian stood puzzled at this. The islander who lived far from an oyster-bed rested his canoe on the bosom of his own waters and gazed into their shining depths. Gardens of flowers in bud and bloom seemed spread beneath him. Corals reddened and purpled and gleamed white, like snow. They were cleft and broken; here and there huddled in mounds; here and there looking like ruined temples and fallen palaces, up through whose gravelly floors rose tree-like columns with branches which the lazy ripples swayed. Fishes with golden gills and fins and silvery backs darted in and out. 'Why,' he would ask, 'must I always go to the far-off Tuamotus for the shining shell, instead of inducing it to make its home here?' And, to deepen the contrast, where shells abounded, there also sharks were found. Other creatures, too, inspiring terror or disgust were frequently encountered in the regions favoured by them.

Hence, since long before the advent of the white man, the natives outside the pearl districts have been labouring on the problem of transportation and cultivation. The earliest records of the South Seas tell that the islanders whom the white man consulted regarded cultivation as almost impossible. The savages pointed to bays and reefs which had been the scene of experiments, and went on paddling their canoes or flying like birds with outspread sails over the waters to distant haunts. As was the belief before civilised history opened, so it is to-day among the general body of the natives; and the solitary individual who now and again experiments anew is looked upon by his fellows with a

compassion which still proves their interest in the question.

White men made many attempts to translate the oysters to a fresh habitat, but with results which have hitherto made them firm supporters of the native opinion.

And yet there is nothing mysterious about Mr Saville-Kent's method of working. He established experimental pearl-shell nurseries at Thursday Island and at a landing-stage in Torres Strait, and has submitted to numberless tests his plans of deportation. The main difference between his mode of transit and that followed by other white men and aborigines is that the Commissioner's divers collect young shells for transportation, and keep them during the journey immersed in continually changed sea-water; whereas under the old practice it was thought sufficient to give them but one supply of water. The years devoted specifically to experimenting are but a small portion of the time the Commissioner has given to the study of the habits of the pearl-oyster. He has been an enthusiast on the subject, and his Government is now satisfied that by his method successful transportation is assured.

The natural result of this is that the foreshores of Northern Queensland have suddenly acquired a commercial value unthought of in the past. The Governor in Council, appreciating the new departure, at once framed a set of ordinances to regulate and control the anticipated traffic. Till the beginning of the current year, pearl-shell fishers were left very much to their own devices. They were mostly a lawless lot. The men of one station were in frequent feud with those of another. The principals strained every nerve to overreach one another, and no practice which succeeded was accounted nefarious. So little honesty was there in their conduct that the pearls had long ceased to be objects of legitimate industry; they had become objects of swindling or plunder. The divers stole them from the shells; the masters stole or violently pillaged them from the divers; and the purveyors of rum and brandy absorbed them from the last holders. The shells alone remained a staple industry. The new regulations contemplate changing all this. The foreshores will be mapped out into small leaseholds, with conditions of residence and improvements attached. The cultivation of the pearl-shell will be pursued as assiduously as its capture. Waters now barren will be stocked, and the only limitation to the area of cultivation will be climate. Raiding and exploitation will be ended, for oysters of certain sizes only will be allowed to be captured. As a general rule, the capture of any shell whose 'nacre,' or pearly lining, measures less than six inches in diameter will be illegal and its exposure for sale penalised. There are dwarf forms of shell which will be excepted from this; but the young ones of even these species will be protected from the indiscriminating beachcomber and his allies.

Mention was made of the theftuous disposition of many engaged in the traffic. There appears to be something in the pearl, as in the diamond, which allures from the path of honesty. The divers are mostly Papuans, Malays, or aboriginal Australians, and a high degree of virtue is not to be expected from them; but it can be safely stated

that the most upright among them will fall in the presence of the smallest pearl. It is true that many pearls get accidentally lost. In opening the shells, the divers let the pearls slip out with the water as often as they catch them. It is currently believed that at the bottom of every station there is a deposit which, when a way of working it is found, will give a fortune to the man who raises it. But, allowing for accidents, the return of pearls is far from what it should be in the estimate made of the season's work; there is abundance of shell of the right sort; but what has happened the enclosures? The only answer to this is that they are surreptitiously made away with. Many beachcombers prohibit their divers to open the shells. They perform the work with their own hands, and the precaution is a wise one. It only partially succeeds, however. The natives have sometimes an instinctive knowledge of a pearl-bearer, and if denied all chance of opening the shell, they will not detach the oyster at all. Mr Saville-Kent suggests in this connection that well-boats should be employed, into which the divers should throw the unopened oysters, and that at the close of the day's fishing, the master should tow his boat to the station and open the shells at his leisure. The suggestion will no doubt be adopted by the lessees; and provided the divers can be weaned from their old habits, the result should be satisfactory. The Australian pearl is already a matter of history. A fisherman on one of the beaches of West Australia picked up a pearl, which he sold for ten pounds, and which came afterwards to be valued at ten thousand pounds. About the middle of last year, a prize of similar value was drawn from the northern waters.

In any case, the Queensland experiment deserves appreciative recognition. If the pearl-oyster can be thus successfully transported and cultivated, numberless tropical bays and lagoons, now of little industrial value, may be planted with these fish and made fields of profitable enterprise.

ON WAIST-GIRDLES.

THE Girdle is an article of dress with a history that is not unimportant or uninteresting. It has in times past been much more highly esteemed than it is now; and was, in fact, among not a few peoples, worn by both males and females. This was so amongst the ancient Hebrews, as well as amongst the Greeks and Romans, who found it well nigh indispensable because of the flowing raiment they wore.

In Rome, a man's investiture of his girdle showed that he was intent on work of some nature. When he took it off and let his tunic fall, it was potent to all that business was over, and that he was free to speak to his friends at his and their leisure. Thus the girdle served a purpose—negative in its character, of course, but a purpose, nevertheless. Its sphere of usefulness did not end here. It was figurative of property. When a man or woman put off his or her girdle, it was a token of renunciation of some right or privilege. The widow of Philip I., Duke of Burgundy, for instance, renounced her right of succession by 'putting off her girdle on the Duke's tomb.' Per contra, the Princes of Ireland in taking the oath of fealty to King John laid

aside their girdles, their *skeans*, and their caps. 'In the ceremony of excommunication,' says a writer, 'the bishop cut or tore away from the culprit the girdle that was about him; and the newly-made husband in Rome took from his wife the maiden girdle of sheep's wool in which she was bound up to the day of her marriage.' Howell quotes as familiar a French proverb, *Il a quitte sa ceinture* (He has given up his girdle), which intimated as much as if he had become bankrupt, or had all his estate forfeited, it being the ancient law of France that when any man, upon some offence, had the penalty of confiscation inflicted upon him, 'he used before the tribunal to give up his girdle, implying thereby that the girdle held everything that belonged to man's estate, as his budget of money and writings, the keys of his house, with his sword, dagger, and gloves.' The fact that the girdle was used as a purse had much to do with its importance in general appreciation. We have an English proverb confirmatory of this appreciation. It said, 'Ungirt, unblest;' and that it was in very common use is clear from the frequency with which the phrase occurs in old out-of-the-way literature.

The girdle was used for other material or actual purposes besides that of a receptacle for money. At it were hung the thousand-and-one odds and ends needed and utilised in every-day affairs. The scrivener had his inkhorn and pen attached to it; the scholar, his book or books; the monk, his crucifix and rosary; the innkeeper, his tallies; and everybody, his knife. So many and so various were the articles attached to it that the flippant began to poke fun. In an old play there is mention of a merchant who had hanging at his girdle a pouch, a spectacle case, a 'punniard,' a pen and inkhorn, and 'a handkercher, with many other trinkets besides, which a merry companion seeing, said it was like a haberdasher's shop of small-wares.' In another early play a lady says to her maid: 'Give me my girdle, and see that all the furniture be at it; look, that cizers, pincers, the penknife, the knife to close letters with, the bodkin, the ear-picker, and the scale, be in the case.' Girdles were in some respects like the chatelaines not long ago so much the rage amongst ladies; but they differed therefrom in being more useful, more comprehensive in regard both to sex and to articles worn, and when completely furnished more costly. It is partly for this last reason that we find girdles bequeathed as precious heir-looms and as valuable presents to keep the giver's memory green after death. They were not infrequently of great intrinsic value. One of King John's girdles was wrought with gold and adorned with gems; and that of the widow of Sir Thomas Hungerford, bequeathed in 1504 to the mother church of Worcester, was of green colour, harnesssed with silver, and richly jewelled.

Not a few wealthy commoners were able to afford the luxury of gold-embellished belts, and were not superior to that pardonable vanity so long as no regulation prohibited them. Those who have studied our social history will not be surprised to learn that enactments were passed restraining them. Edward III. forbade any person under the degree of a knight from wearing girdles gilt or of silver, unless he should

happen to be an esquire of substance valued at more than two hundred pounds, when a reasonable embellishment was tolerated. Henry IV. confirmed this regulation; but it does not seem to have been stringently enforced, for Edward IV. was constrained to impose a penalty of forty pence upon the wives of servants and labourers who should have the impertinence to aspire to be as good as their masters' spouses.

Girdles were an object of superstition, more especially if they had belonged to female saints. Such girdles were popularly believed to possess a certain remarkable power—the power, namely, of protecting women from some of the more serious illnesses that are attendant or consequent upon childbirth. This superstition permeated through all classes of the sex. Queens credited the miraculous virtues of 'Our Lady's Girdle,' and paid large prices for the loan of one. The majority of these girdles were believed to have been the property during her lifetime of St Margaret, the gracious patroness of married women. Mostly every nunnery in England—to say nothing of France—possessed one. There is in an old Irish poem, with the charmingly euphonious title of *Oran eadar Ailte agus Mac-Ronain air dhoibh fearg a ghabhail ri Eionn*, an allusion to the efficacy of an enchanted or sanctified girdle in this same direction; and we are further informed that 'sickness cannot affect those whom their girdle binds.' In Ossian there is mention made to much the same effect. It does not matter that the poems of Ossian as put before the world by Mr Macpherson are not genuine; one of the schoolmaster's commentators states that 'sanctified girdles till very lately were kept in many families in the north of Scotland. They were impressed with several mystical figures, and the ceremony of binding them about the woman's waist was accompanied with words and gestures which showed the custom to have come originally from the Druids.'

LOST YOUTH.

SING, till the glad world wake again,
The sweet, glad world of long ago,
Where sunbeams slid athwart the rain,
And wild winds set the seas aglow;
Sing the old songs that held the ways
Enraptured in the vanished days.

Sing, so perchance the swans may glide
O'er their white shadows, as of yore,
And far along the brown hill-side
The purple heather glow once more;
Sing, for the heaven is dim and strange,
And all the earth hath suffered change.

Alas, no song hath now the art
From out the dead past to recall
The joy of ear and eye and heart
That made our lost world's coronal.
The sweetest song man ever sung
Hath not the power to make us young.

ON THE IRON ROAD.

IN all ages, men have pleased themselves by comparing the works of their hands with their Maker's handiwork. Thus, many a long analogy has been drawn between a steam-engine and a man; yet press the analogy between the two careers—a man's and an engine's—as closely as we may, there always remains the vital difference that in the thing of man's creation there resides no indwelling recuperative power to remedy injuries—in other words, there is no life. So in making a comparison between a railway journey and the journey of life, that is found to be but an imperfect analogy, except in this, that the journey once commenced, it must, barring accidents, roll on to its close.

But it is not with far-fetched, strained similitudes we are at present concerned; the road of life may be an Iron Road to most of us; we may fight, or disclaim to fight, for the best places on it; we may yield precedence to age and weakness, or jostle it aside, according to our characters; we may lend a helping hand to the fallen, or turn our backs on them; but on one thing the student of human nature may always confidently rely—that on the iron road, the characteristics of men and women are displayed more unhesitatingly than in any other scene of life. Here, in a third-class compartment, the habitual insular reserve yields to the pressure of numbers, the warmth of contact, the irresistible expectation of sympathy from unknown sources. Who that is in the habit of travelling 'first' ever had his ears tickled by a new word, coined and passed current in his very presence? Yet in our beloved 'third,' this is by no means an uncommon experience. Very recently, we were gratified by hearing a 'woman of the people' thus wind up her description of the manner in which her son 'Bob' had been deluded away from the path of virtue. 'He'd be all right,' she concluded, 'only them other boys *'coyducks* him; so his master sacks him, and sends he home.'

Bless her homely face! How we loved her

as she sat puckering her honest forehead, furrow over furrow, contemplating silently the problem of having the delinquent Bob at home, 'out of place;' and longed to tell her that, all the world over, there were scores of Bobs in the same predicament and from the same cause—namely, 'the *'coyducksing* of them other boys.'

Her interlocutrice was one of that numerous class to whom all lugubrious details are as meat and drink. Her face was of the aquiline type, long and bony, and her talk was of deaths and funerals. To her the world was not so much a stage, as an undertaker's establishment; nothing in her friends' lives became them like their leaving it. She was very particular in describing the end of one old gentleman whose fancy it was to be interred in a scarlet shroud, in which raiment he looked, she affirmed, what we should scarcely have anticipated, 'real elegant.'

We cannot deny that the third, like other classes, occasionally accommodates wayfarers to travel with whom, hour after hour, is not to tread precisely the primrose path of dalliance. However, as bad meats will not nourish the best constitution, neither will good meats digest on a satiated stomach; and the fact that a fellow-traveller is not to our liking may be due as much to our unseasoned palate as to his native idiosyncrasies. His nonsense does not happen to suit our nonsense—that is all, as Lamb said when his farce was hissed. For instance, it depends very much upon our mood whether we are irritated or amused by the slim, carefully-dressed gentleman who enters the compartment a model of propriety, and almost instantly sloughs the cocoon of outward self-restraint and stands revealed as an arch-fidget. First his overcoat must be removed, folded accurately, and deposited in the netting overhead; his hat follows, and a travelling cap is produced. Surely, never before did any head-dress require so many twichings from side to side as this cap. He seats himself only to jump up again immediately, in order to disinter a newspaper from the pocket of the garment he so carefully folded a minute ago. For

full five minutes he is busied pressing the creases out of his paper, every movement covertly followed by the fascinated eyes of his foreboding fellow-travellers. At last he subsides with the columns before his eyes, and his credulous companions heave a sigh of content in concert at his relapse into quietude. Quietude! Not he; he has unfurled his banner not to study its contents, but merely, as it seems, to crackle and flourish it in the faces of his outraged neighbours; and having reduced them to the very verge of expostulation, he proceeds to refold it with as much precision as if his existence depended on the accuracy with which corner meets corner; and this done, he sits upon it, and looks round him with an innocent Jack-Hornerish expression of goodness and self-complacency on his countenance.

To be fidgety in a theatre, a concert, or lecture-room, or when cruelly penned in a pew, is bad; but in these places public opinion is soon brought to bear in a wholesome manner on the offender. If the irascibility of his nerves is such that he cannot duly control himself, he can leave, and the sooner the better; but here, we who are shut up with him are not murderers, except perhaps in intention. We cannot band together to thrust this tarantula out of window; scowls are quite lost upon him; he has reckoned us up, and not for one nor for all will he put a padlock on his restless limbs and ever-wagging tongue. For all this while he has been darting questions, reproofs, demands, at his imperturbable mountain of a wife, who, by the happy law of contrast, has scarcely moved a finger or an eyelid since she entered the carriage with him. She is the lightning conductor round which the lambent flame of his ubiquitous restlessness plays harmlessly. Presently, a meal, that ought to have amused this spendthrift of his diversions for at least twenty minutes, is despatched in less than ten, and is succeeded by a raging thirst which he has no means of allaying. Long before we reach a station, he has risen and clutched the door handle: that he reaches the platform on his feet instead of his head, is due to his executing a staggering *pas seul*, so fantastic that even his phlegmatic wife sanctions our unanimous titter with a slow smile. Yet he has his good points; for a porter appears almost immediately bearing fruit and milk offerings for the lady, who absorbs them with a deliberate ruminating satisfaction that is highly edifying; and which lasts unimpaired during the remainder of their stay with us, and is visible on her countenance as she follows her husband slowly up the platform, he gesticulating like a semaphore to a distant and undiscerning cabman.

Not so irritating, if certainly not so amusing, is the portly gentleman, in shining black broad-cloth, who deposits and retains between his feet a patent-leather valise, as portly, as shining, as black, and in as good condition as himself. Whatever else this traveller may be, he is quite at home. If he had chartered the whole compartment, and the rest of us were occupying our seats on his sufferance, he could not be more so. Wholly regardless of the crushed-up little widow facing him, he spreads his legs on either side of his pet portmanteau, solicitous of its safety, and quite unconscious that by the mere impact of

his massive shoulder he has pinned the gaunt lad beside him to the back of the carriage. Evidently, he is one of Jael's guests, accustomed to eat butter from a lordly dish. Every fold of his balloon cheeks, every crease of his redoubled chins, every furrow of his fleshy forehead, tells of unchecked appetite, unopposed arrogance. His neighbours are no more to him than the chance flies that settle near it are to the black valise. A planet-man without apprehensiveness, and without curiosity.

He retained the Jovian calm of his demeanour unimpaired when a lady bustled hastily into the carriage, uttering the ominous words, 'I don't wish to be fussy; I hate a fuss; but is this the train for Z—?' The question was put tentatively and collectively. With the good-nature characteristic of third-class passengers, two or three volunteered to give her information. From these she selected a sad-eyed gentleman sitting opposite to her, who, by replying to some two or three and thirty interrogatories, eventually succeeded in convincing her that Z— was a terminus, beyond which she could not conveniently be carried by the most maliciously conspiring of companies. Having arrived at this consoling conviction, she proceeded to rearrange her bags, baskets, and other feminine accoutrements; on which, a heavy, lumpy-looking lad who accompanied her, having made a sheepish attempt to assist her, was rewarded with a, 'Don't dash! Edwin; I'm far too tired for dashing!' Nevertheless, she, who could not endure Edwin's 'dash,' made, immediately we arrived at a station, a dart for the window, and having secured a porter, promptly put him through his facings in a series of questions almost identical with those wherewith she had plied her opposite neighbour. Just as the train was moving on, a newspaper lad thrust an illustrated 'daily' into the carriage window and yelled interrogatively, 'Funny Folks?' We were by no means surprised to hear the sad-eyed gentleman opposite murmur in response, 'Yes—very.'

Once, and once only, in the course of a long journey, was this irrepressible dame in any degree abashed. It was in this wise. It so happened that the tickets for Z— are collected at X—, two stations earlier on the line than that famous terminus. Moreover, it chanced that on this occasion the ticket-collector had had his humour crossed by the boisterous behaviour of some college lads in an adjoining compartment. These, returning happy and glorious from some local cricket match, had been exercising their victorious lungs on the popular ditties of the day ever since they had come on board. And the collector's demand for their tickets—safely ensconced in the pocket of a master in a distant carriage—only met with redoubled shouts and some mild chaffing in reply. As he banged the door of their compartment and wrenched ours open, he snarled out, 'I know what they teaches at your college—they teaches Ignorance!'—a sally only received with a roar of applause from the lads. This sardonic official was consequently not in the humour to be questioned with impunity, and to our lady's suspicious query, 'This is not Z—?' he only repeated surlily, 'This is not Z—.'

'There is another station between here and Z—?' she continued hardily.

'There is another station between here and Z——,' was stubbornly reiterated.

'And yet you take the tickets here?' she demanded.

'And yet we take the tickets here,' he echoed, with such bitter intensity of emphasis, that the poor lady sank back with actually something like a blush upon her cheek.

That travelling dissipates prejudices is an old saying; that it teaches us what books or pedants never can—namely, that useful science, knowledge of the world, is more certain; if it disciplines us into bearing our own grievances rather than trespass on the comfort or convenience of a—temporary—neighbour, it does us a greater service than merely carrying us where we wish to go.

In conclusion, we will briefly narrate a little incident that happened, years ago, upon the iron road, to show that not only may prejudices be dissipated in travelling, but that friendships may be founded under the most unlikely circumstances, and in spite of prejudices the most obnoxious. Some of our readers may remember the murder, in a first-class compartment, of the unfortunate Mr Briggs by the German Muller. A wave of tragic horror passed over all respectable travellers in or near London, and, it is said, greatly lessened the numbers of the first-class ticket-holders. However that may be, it happened that a Mr Wilson took his seat in a first-class compartment at Cannon Street Station on the afternoon of the day succeeding that terrible crime. The friend who saw him off remarked on his having the compartment to himself, adding that he was not likely to be troubled with company on account of yesterday's catastrophe. Accordingly, the pause at London Bridge had been made without any one entering Mr Wilson's carriage, and the train was in motion again, when the door flew open, and a man rushed in, and was flung into a seat by the starting of the engine. Much wrapped up, with his hat crushed down over his forehead, his height and appearance at once suggested to Mr Wilson that he was shut in with Muller himself. The resolute mouth and pointed chin—the only features distinctly visible—tallied with the descriptions of the murderer, of which Mr Wilson's mind was full. From behind the shelter of the 'Times' newspaper he continued to observe the newcomer and to compare item by item his appearance with the description in the columns before him. Ever and anon, while so engaged, his eyes met the wavering glances of the stranger, full of ominous meaning—so it seemed to him—and when he rose, unbuttoned his overcoat, and consulted a handsome gold watch with pendent seals, Mr Wilson thought he saw before his eyes the very property of the unhappy Mr Briggs. Reason is a light rider, and easily thrown when imagination runs away with it, and fear, though it may brace for a moment the sinews of the body, relaxes those of the mind; so, when the stranger moved along the carriage, seated himself opposite Mr Wilson, and asked, in a hesitating guttural voice—in every tone of which Mr Wilson heard the accent of the Teuton—if 'they were not timed to run thirty minutes without stopping?' Mr Wilson could only nod—his tongue clave to the roof of his mouth, and his eyes could not withdraw their gaze from the fiery orbs opposite.

While the two men sat thus, glaring at each other, the train dashed with a prolonged scream into the S—— tunnel, and the carriage was instantly in total darkness. At that moment Mr Wilson's wrists were seized with a grasp of iron. Deprived of the power of resistance, he sat preparing himself for the death-struggle as best he might, his hands held as in a vice, his eyes straining through the darkness, a cold sweat oozing at every pore. As he sat thus, it flashed into his mind that his assailant would probably wait for a glimmer of light before aiming his death-blow. As he thought this, they were out into the daylight, glaring at each other and gasping. Then Mr Wilson felt his enemy's hands relax, and heard him say in an interrupted voice: 'I beg your pardon; I'm afraid I've startled you. The fact is—the plain truth—I didn't like your looks, and the way you hid your face behind that paper and watched me. I suppose my mind is full of this horrible murder. I see now I was mistaken. But—pardon me; I really began to think you might be—Muller!'

With a half-hysterical laugh, Mr Wilson responded: 'And I've been in an awful funk, for that's just who I thought you were!'

In this instance, prejudice yielded to the knowledge gained by travel; for before they reached M——, the seeds of a friendship, still flourishing, were sown in the minds of these two wayfarers on the Iron Road.

THE BURDEN OF ISABEL.*

CHAPTER XXVI.—THE GREAT COTTON GAME.

BUT while affairs in London thus moved smoothly and with a comfortable lack of interest, matters in Lancashire were excited to a degree which presently wrought great consequences on all concerned in this history. George Suffield, even during his weeks of soiling to and fro to the Isle of Man, had committed himself seriously to speculation in cotton. Before the holiday season, he had had several successful deals through Tanderjee and Gorgonio; but their success had been quite eclipsed by that ventured on—and noted in a former chapter—by the advice of Gorgonio. His speculation in Septembers enriched him in a very few days by about two thousand pounds: he bought—through Gorgonio—at 5½ (that is, 5½d. per pound)—and sold again within a fortnight at 6½.

Thus elated and made confident, before even the end of August he began to buy largely of Octobers and Novembers—still through Gorgonio—with the intention of holding; for Mr Gorgonio's longing for a 'corner' in cotton had not been uttered in inattentive ears. The truth is, George had caught the fever of speculation, and caught it badly; besides the attractive feelings of danger and excitement, it created dreams of vast wealth to be realised in a few months, visions of ease and luxury, love and idleness, with the one adorable woman of the world sitting queen of all. That Isabel was always first in his thoughts, that all his design was for her ultimate adornment and delectation, redeems George's aberration into this doubtful course from

the suspicion of sordidness and vulgarity. He was the kind of lover who is not demonstrative in word or gesture, but who expresses himself in gifts; and his designs for gifts were magnificent, though they were not love. The methods, however, by which he was led on and tempted to arrive at the fulfilment of his designs—and the toils in which he became snared—are of such prodigious moment that they must be dealt with fully by themselves. But first it is necessary to relate one or two matters connected therewith.

Daniel Trichinopoly had been so affected and scared by the dumb, death-bed confidences of his late master, that he had determined (almost) to forswear Tanderjee and Gorgonio, and with the tolerable wealth which the Sahib Raynor had conferred on him—the gratuity of fifty pounds and the legacy of fifty pounds more—to return over sea to his native place. But his new master had received him back with such signal favour, and had so loudly opposed his expressed desire that he might ‘go away,’ that he remained. It was inevitable that Daniel, having thus far yielded to temptation, should return to Tanderjee, and that Tanderjee should remind him with tears of the ‘beautiful’ tricks they had intended to play together—with the result that the impression of the Sahib Raynor’s death-bed became fainter and fainter, and that the last case of Daniel was worse than his first.

Precious time had been lost, and Daniel became angrily impatient to attain his ends. The most pressing and important of these was not only to become acquainted with the new Suffield machinery, but to get at the plans of it, of which Daniel was prepared to make ‘tracing copies.’ But he could do nothing for fear of ‘the old Guru.’ He had discovered that the Tame Philosopher now frequented nightly that part of the clough about the counting-house, and he was certain that he was on the watch.

He dropped this and that tale—not altogether untrue—into the ‘respectable Mister George’s’ private ear of the opprobrious things the Guru had said, or was reported to have said, concerning his ‘dear master,’ so that the Tame Philosopher was asked to dinner no more, and Mr George when he met him passed him with the merest word, cold and curt; and, last of all, he told the ‘respectable Mister George’ that he had caught the Guru on a certain occasion when he had come up to the hall to interview Mr George, listening at the library door when he (Mr George) and Mr Gorgonio were talking of cotton and of ‘corners.’ After that, Mr George refused to see the Tame Philosopher. But he was scarcely prepared for the immediate, and still less for a consequent, result. The immediate result was the Tame Philosopher’s migration to London, which was brought about by his writing a letter to the elder Mr Suffield of such a nature that the latter felt bound to invite the Philosopher to London. He needed a Secretary: every public man should have a Secretary; he would invite his old friend to be his Secretary; and his old friend would aid him in the invention and the writing of those speeches on great questions which his wife so longed that he should deliver.

Thus it came about that in less than a week

after Suffield had received the above letter, the Tame Philosopher left Lancashire and established himself as Secretary in Rutland Gate, with a lodging in the Brompton Road. Then came the subsequent result, unlooked for by Mr George.

The Tame Philosopher lost no time in looking up his ‘young friend’ Mr Alan Ainsworth; for he considered that—besides being Secretary to a politician, and partly on that account—he was eminently fitted to utter opinions on public questions, and that his eloquent style was certain to fascinate the London people and to bring himself the reputation and content for which his soul did pine.

One evening, therefore, when Ainsworth was rumpling his hair and tugging his moustache over his work, the Philosopher was unexpectedly ushered in.

‘You are busy, my dear young friend,’ said he, sitting down. ‘It is well to be busy, but not too busy. I would adapt Solomon’s maxim and say, “Be not busy overmuch.”’

‘Yes; I am rather busy,’ said Ainsworth, tapping his teeth with the handle of his pen: he found, presently, that he might lay his pen down, for the Philosopher had come to stay.

That was the Philosopher’s opportunity, and, after a complimentary remark or two concerning the quality, in his estimation, of Ainsworth’s work, he launched his proposal.

‘Do you know,’ said he, ‘that I have what should be a fruitful idea, and I am willing to offer it to you for the benefit of your paper. I shall write a weekly article—I think the form of a letter would be best—giving my opinion of the world to the world—what I think of its silliness, its folly, its chicanery, and its villainy. I am now in the very midst of things political; and I have sounded to the bottom the working of Lancashire industry and understand all its villainies.’

‘What, by the way,’ asked Ainsworth, with some hope of diverting or defeating the Philosopher’s evident intention of asking employment from him, ‘has become of my pet villain, Daniel Trichinopoly?’

‘Oh,’ said the Philosopher, ‘Daniel seems to be very well, and is certainly flourishing exceedingly under the *egis* of the house of Suffield. How exactly he is occupied I do not know; but he is deep in the confidence of Mr Suffield the younger, and he seems to have great influence over him. I may say, without prejudice to humanity in general, or to the race to which he belongs in particular, that I do not like Daniel, or trust him. He appears to be a child of light; but in reality, I fear, he is a creature of darkness: he has a notorious devil in his eye, and I doubt his end will not be peace with honour.’

‘Do you think,’ said Ainsworth, remembering his experience of Daniel in the opium den, ‘that he is engaged in some villainy?’

‘That,’ answered the Philosopher, ‘I would not venture to say. But he is prodigiously interested in cotton, like his master; and there is room in that for plenty of villainy. And, talking of cotton, my dear young friend, I would like to write for you an article on “corners” in cotton.’

'What exactly is a cotton "corner?"' asked Ainsworth.

'Well, my dear young sir, I'll explain by analogy. In Egypt in the olden days Joseph made a "corner" in grain: he bought up all the grain he could lay hands on and held it till people had to go to him and buy at whatever price he chose to sell. That was a notable "corner."

'Well,' said Ainsworth, 'write your article, and I'll submit it.'

The end was that the Tame Philosopher wrote his article on cotton 'corners,' wrote it, moreover, as one who had special knowledge of the subject, wrote it with particular mention of a 'corner' that was imminent in Lancashire, in which certain foreigners of Levantine and Indian origin would probably be found concerned. And the article was published and widely quoted and commented on (in Liverpool especially); and it was read by—among others—the elder Suffield, who wrote straightway to his son, and put such questions as these: Do you know anything from hearsay of this 'corner?' Have you made any provision of stock against it? And, do you think it likely that your ugly foreign broker—Levantine or something—whom we met that day in the Isle of Man, has anything to do with it?

George Suffield was angry and alarmed. He was angry because he knew—for his father told him—that M'Fie had written the article; and he thought that M'Fie knew far more than he possibly could know, that being a philosopher, metaphysical, prying, secretive, and crafty, he had argued out a conclusion, which in truth, like many a philosopher, he had only blundered on. And he was alarmed, because he feared that the incipient 'corner' might be spoiled by the shyness of operators on 'Change, and that his own design might be ruined and his father somehow might learn the whole business. He therefore wrote to Mr Gorgonio advising great caution in buying up 'futures'—though he would suggest not so much that he should restrict purchases as 'spread them out small among a great many people'—and declaring that it would be better thenceforward that he should not be publicly seen with Gorgonio, but that communications between them should be by letter, or through Mr Tanderjee or Daniel Trichinopoly. Nevertheless, one final confidential interview he thought they might have, to settle an important point: 'Shall we continue to think of a corner, or shall we not?' and he begged Mr Gorgonio to come on a certain evening to dinner to meet Mr Tanderjee and to stay the night.

On a certain evening, then, the three sat at dinner in Holdsworth Hall, and gradually grew more flushed and gay with the excellent meats and drinks that were set before them. Daniel waited upon them, and as he moved with soft self-possession and an easy smile behind their chairs, and as they ate and drank and talked, it really seemed as if Daniel were the only person there, and the others were puppets which he cleverly manipulated. And this was the conversation of moment in which Daniel seemed especially concerned.

'We have done a good deal of business together, Mr Gorgonio,' said George expansively, 'and you

have never led me wrong: not once have I lost a farthing through you; not only have I lost nothing, but I have made a good deal. I take this opportunity, Gorgonio, of acknowledging it.'

George put his hand to his glass; Daniel noiselessly approached and filled it, and then filled that of Gorgonio, and the two puppets bowed to each other, and Gorgonio murmured, 'A vot' santé!'—and Daniel smiled his approval as they both raised their glass and drank.

'I think,' said Gorgonio with a smile, 'we quite understand each other.—What, Mr Suffiel', is your opinion of the present state of the cotton market? Ha, ha!'

'We stand pretty well—don't we? We hold contracts for eighty thousand bales of the December-January deliveries—do we not?'

'Contracts, Mr Suffiel', for ninety thousand December-Januaries!' exclaimed Gorgonio. 'I bought ten thousand more to-day! Now see here, Mr Suffiel! Mark my word! Not a single one bale will be tendered in December! Because why, Mr Suffiel? Because, sir, we are in November, and there is no more than ninety thousand bales in the whole city, and the stock will be not much more in December, because not so much cotton will come in as people expect—I have show you the American crop is shorter than they think—and we keep our advantage by buying. If on the 31st of December there is no more than one hundred thousand bales in Liverpool, and we hold contracts for ninety thousand still, then, Mr Suffiel', we control the market.'

'I want to do more than control the market,' answered George, expanding his chest: 'I want to rule it.'

'Go on with corner? Ah, if you do that!' exclaimed Gorgonio. 'Ah!' he sighed, and his eye flashed. And Tanderjee murmured 'Ah!' and his eye flashed behind his spectacles; but Daniel behind them all only smiled with superior benignity like a bronze Buddha.

Then there was evidently a breathless moment for the three Asiatics—the two puppets and the other, who for the nonce forgot his part of manipulator—until George resumed the conversation, with trade technicalities interspersed that would not be likely to interest the reader. Then George pushed back his chair preparatory to departing into the billiard-room.

When they had spent some considerable time in the billiard-room, Tanderjee departed to catch his last train for home, and in a little while George and his remaining guest went to bed. Then—again a little while—and the house appeared all quiet and dark. To make sure that all was quiet when all was dark, a dark figure, darker and more substantial than the darkness, with no gleam of white anywhere about it, neither on face nor hands, passed softly along the upper corridor and listened at this door and at that. As the figure turned away from the second door, a board creaked dully beneath its tread and beneath the carpet, as if the ghost of Hamlet's father were in 'the cellarage' and fumbling to get out. But the figure went on softly—on and down the wide stairs to the hall and to the hall door. By the time the bolts and chains of the door had been carefully undone, another dark

figure, but with touches of lighter colour about face and hands, appeared softly at the top of the stairs and leaned over. As soon as the door was unfastened and the first figure had passed softly out, softly latching the door, the second figure sped swiftly and softly down the stairs, found the latch of the door, and slipped carefully out after the first.

The first figure was Daniel Trichinopoly. He had private business on hand that night, and privately he was setting about it. He had not yet discovered where the plans of the new machinery were kept, and every day that passed made the necessity for their speedy discovery more and more insistent. In the second figure it would not have been difficult to recognise the ugly Gorgonio. And the first sped on through the thick November night, and the second had great trouble to follow near enough and yet far enough off—over the sodden grass of the park, across the fence into the clough, over the brook by the little rustic bridge—that was rather difficult for Gorgonio, without incurring the risk of being seen, but he achieved it on his stomach—and along the further bank of the stream to a hole!—merely a hole in the side of the clough, like a rabbit's burrow enlarged, almost hidden by a bush and almost blocked by a large stone! To Gorgonio's amazement, Daniel quickly stripped himself to his under garments, laid himself down, and crept into the hole! Gorgonio sat down on the stone by the hole to wait for Daniel's return, and to meditate on the possible purpose of Daniel's burrowing.

'He do not visit his native home that way,' he murmured to himself. 'No, no; the way is too long and too war-rm! Ho, ho!' and he chuckled at the grimness of his joke. 'But where goes he, the dear Daniel? It is necessary he go somewhere, and for something. Lofe? No, not Daniel. Money? Eh? Something—something in a house: there is no money in this English ground. Ah, and we know in our East—do we not, Daniel!—that way of digging hole to enter house! Now where is a house?'

He rose from the stone and explored a few paces in the direction in which the hole seemed to run, and peered through the darkness a few paces farther still. He thought he saw a wall. He pushed a little nearer, and made out a small building of two storeys, whose outward wall was apparently part of the circumambient wall of the Suffield works.

'Ah, yes,' said he to himself. 'Here is something; and certainly here must be something inside. Windows strong and barred like prison; and *chevaux de frise* on walls. Certainly there is something inside.'

But lest Daniel should have slipped out of the hole, Gorgonio returned. Daniel's clothes were still there, so he sat upon the stone at the entrance, with his eye upon the building which he had discovered. When he had sat some time and was becoming cold, he was certain that he saw a light flash in a window of the building. He jumped up.

'Ah, the dear Daniel! He must be there! Now I will have laugh to myself! Now I will scare him; now I will frighten him! Oh, ho, ho! How he will be frighten, the dear Daniel!'

He ran along to the building, threw pebbles and dirt at the windows, and shouted in a gruff voice: 'Ho, ho! I saw you! Come out, sir! Come out!' and then ran back to the hole and laid himself on the stone with his face ready to put against the opening. When he heard a rumbling and heavy breathing, he prepared, and when Daniel's head appeared from the hole he faced it, and said: 'How do you do?'

(To be continued.)

THE CEDARS OF LEBANON.

THOUGH the lower slopes of the Lebanon are well known to the European inhabitants of Syria, who make these hills their summer resort, the upper ranges, clad in eternal snow, remain comparatively unexplored. When travellers invade the heights, the magnet which draws them thither is 'The Cedars;' and they have little idea that they are entering a region fraught with historic and romantic interest, and whose scenery, in grandeur and in varied effects, equals that of the Alps. One might spend several weeks among these hills and valleys, and yet leave much that is beautiful unseen.

We, unfortunately, had only four days at our disposal; the time assigned for our tour in Palestine was almost at an end, and we were on our way to Beyrout to join the steamer for Athens. We had started from England towards the close of March, and landing at Jaffa on the 11th of April, had resigned ourselves to the care of Bernhardt Heilpern, Messrs Cook's chief dragoman. Under his guidance we journeyed north through Bethel, Samaria, and Nazareth; then east to Damascus; and then northward again to the magnificent ruins of Baalbek, and we determined that, if possible, we would go to Beyrout via the Cedars of Lebanon.

There is a certain charm in getting quite off the beaten track, and in accomplishing something that others leave undone; so that, though all through the tour the Ultima Thule of our ambition had been Lebanon and the Cedars, the desire to see them increased when Bernhardt told us that few travellers found it possible to cross the highest range, where the Cedars are situated, the paths being impassable from the snow until late in the spring.

On the 12th of May, an intensely cold morning, we left Baalbek; and as we rode across the plain, the blasts from the snow-covered mountains became more and more bitter, till, when camping at Ain-ata, we were glad to sit round a camp-fire, though even then, while our faces were roasted, our backs were frozen. To add to the discomfort, a sudden gust blew down tent after tent, discovering the occupants sitting among the ruins—that is, their beds and baggage. The effect was ludicrous; and shouts of laughter greeted each unfortunate individual who was added to the number of the tentless. But we soon became grave on finding that all attempts to put up the tents were ineffectual, and that if the hurricane continued, we should be obliged to seek shelter in the village huts. A description of these huts will enable the reader to realise the situation. Imagine a low square hut built

of earth baked hard by the sun, with a roof of branches held together by mud; a hole at one side answers the triple purpose of door, window, and ventilation; the interior is divided into two rooms, in which the only furniture is a few cooking utensils; these rooms being occupied by the entire family, among whom are numbered the donkey and the poultry. With one voice we exclaimed: 'We will rather sleep in the open air than enter one of those filthy places.' Fortunately, however, the wind abated as suddenly as it had risen, and we were able to use our tents.

The villagers, on finding that it was our intention to cross the mountains, did their best to dissuade us, telling us that there had been a fresh fall of snow that morning, and that it was too deep for the horses to go through. But Bernhardt, steadfastly ignoring these remarks, engaged two sheikhs as guides, and twenty-one men to lead the horses and mules, as there was no trace of a path. We were a goodly procession as we started from the camp to climb the glittering wall of snow which rose before us. There were eleven of us mounted on horses; then came the baggage mules, twenty-one in number, and following these, several horses and donkeys carrying food for our animals. Our party was a mixture of the picturesque and the ridiculous, and the Europeans suffered from being in close contrast with the Orientals—we were ridiculous, and the Syrians picturesque.

We thoroughly enjoyed the ride up the steep side of the mountain; and our wonder and interest were awakened by the clever way our horses picked their path, rarely making a false step, though the going was extremely bad. Suddenly we came to a snow-drift, and the foremost horse went in up to the girths.

'Now, ladies and gentlemen,' said Bernhardt, 'you will please to dismount, and the guides will carry you.'

To this, though the gentlemen objected, the ladies agreed.

After a consultation, Mrs V—— started in 'sedan-chair' fashion, but she was soon deposited in the snow, the men not understanding that mode of carrying. The experiment was repeated, but with the same result; and then Mrs V——, objecting to being made a laughing-stock, refused to be carried any farther, and walked the rest of the way.

Then I tried; but, taking Bernhardt's advice, I climbed on to the man's back, as to this way of carrying burdens he was accustomed. I am about five feet one, and as broad as I am long; the man was about my height, but slight, and therefore I was not surprised to find, after a few steps, myself buried in the snow, with the man buried beneath me. He picked up both himself and me; and on we went, only to fall again amid the laughter of the others. A third time he tried, but with no better success; and then I followed my friend's example, and walked, as I did not wish to be summoned by the 'Society for the Prevention of Cruelty to Animals,' one of our party being President of the Society in his particular town.

When all had passed safely through, we mounted our horses and rode on. Just before reaching the crest of the mountain, we turned to look our last on the 'Holy Land.' Stretched

at our feet lay the plain of Buka'a; across it, miles away, the ruins of Baulbek could just be distinguished; in the far distance were the snow-clad slopes of Hermon glittering in the sunshine.

We passed over the ridge, and stood entranced by the magnificence of the view which met our gaze. To the right and left stretched the curving lines of snow-capped mountains, until, in the far distance, they were scarcely to be distinguished from the masses of cloud; and at the edge of the snow-line, apparently a few hundred feet below, a dark cluster of trees was visible.

'Look—there are the Cedars!'

'Those the Cedars!' we said, disappointed; having pictured to ourselves giants of the forest.

'They are not the dwarfs they appear to be; remember, they are two thousand feet below us,' said Bernhardt; and his estimate was right, for it took us an hour and a half to reach them.

We stood for some time gazing at the indescribable beauty of a panorama in which nature revealed herself under many aspects. On the heights, winter reigned supreme; the snow lay thick on the ground, and there was no sign of vegetation. Lower down, the earth, bare and brown, was strewn with rocks and stones hurled down by the winter's storms; and deep blue lines marked out the course of ravines and gullies; lower still, Spring had begun her gentle sway, and the landscape was clothed with tender green, which, as the gaze travelled downwards, gradually deepened and became richer, until the full glory of summer was attained. In the far distance, ten thousand feet below, lay the blue Mediterranean, separated from the land by a strip of golden sand; and to the left, where the mountains met the sea, was a small cluster of houses, which we were told was Beyrout—and we rejoiced to know that through this glorious scenery we were to take our four days' ride.

Time being precious, we could not afford to linger, and so followed the winding downward path as quickly as its roughness would allow, and were glad to dismount and rest under the shadow of the Cedars of Lebanon. From the mossy ground, starred with forget-me-nots and anemones, rose the massive red stems, with their spreading branches bending under a burden of freshly-fallen snow; shafts of sunlight falling across the boughs and lighting up the darkness of the grove.

There is a great deal of romantic interest attached to these trees. One has heard of them from childhood, and has pictured to one's self trees of more than ordinary beauty, and of an exceptional fragrance. These ideas probably arise from knowing that Solomon considered no other wood worthy of being used in the adornment of the Temple, and that Tiglath-Pileser, having conquered Carchemish, came hither for the express purpose of carrying away a goodly number of these forest treasures to beautify his palaces.

It is probable that at a very distant date the slopes of Lebanon were clothed with forest; but from time to time so many trees have been cut down by the Syrians themselves, as well as by their conquerors, that at the present day they exist only in small isolated groves. The most extensive of these, known to us as 'The Cedars

of Lebanon,' is called by the Syrians 'The Grove of the Lord,' and in it there are three hundred and ninety-three trees; of these, only twelve are of any great size, and they have received the name of 'The Twelve Apostles,' from a tradition that Christ once visited this spot with his apostles, who planted their staves, which grew into these goodly Cedars. The Maronite Patriarch claims the grove as his especial property, and allows no one to cut down or to harm the trees.

I can scarcely describe that afternoon's ride, which was an almost unbroken succession of wonders. Wild and grand, the scenery varied with each turn of the path: we rode on the verge of precipices, down narrow defiles, through streams, and over rocks, across which one would have thought it impossible for a horse to go; but ours picked their way so steadily that we could give all our attention to our magnificent surroundings. Our route lay through several villages, and one of these I especially remember. Built on the side of a ravine, so steep was the slope, that the flat-roofed stone houses looked like a succession of steps, the upper storey of one being on a level with the ground-floor of the one above. Here the women wore the head-dress peculiar to the Maronites—a flowing white veil, surmounted by an inverted silver bowl, which is handed down from mother to daughter, and carefully guarded as an heirloom. The people crowded out to see us pass, and broke from the apple-trees blossom-laden branches, and gave them to us.

That night we camped at the edge of a ravine, opposite to Hazrun, another Maronite town, and during the evening the sheik paid us a visit and smoked a friendly pipe. In a truly Eastern fashion, he placed all his possessions at our disposal, and offered to send his men to guard the camp. This we refused, our own servants being sufficient protection.

The start next morning was not made so early as usual, as some of the party wished to return the sheik's visit. They passed round the head of the ravine to Hazrun, and made their way to the sheik's house, where he received them in a friendly manner and introduced them to his wife and son. I did not go, but instead, remained at the edge of the gorge and watched the ever-varying scene. As the sun rose, the shadows disappeared; the mists on the mountain's breast melted into light; and the faintly-crimsoned clouds which guarded the heights rolling back to let in the morning glory, revealed range behind range and peak above peak. Opposite was a stream which seemed to leap in mad joy to meet its kindred waters in the gorge below. Our domestic affairs also claimed my attention. Usually, the tents were taken down while we breakfasted; and when we came out of the dining tent, the horses were ready, and we mounted and rode off, leaving the servants to follow; when they had finished packing. Later on, when we stopped to lunch, the baggage mules passed, and on arriving at our halting-place, everything, including afternoon tea, was in readiness. Not so in these regions. All the guides but one had been sent back, and as the servants did not know the way, they were to accompany us.

On that day, more grand scenery was in store for us, and there was a continual feast for the eyes. The guide lost his way, and led us by

a path even rougher than that of the day before. First a snow-covered shoulder of the mountain had to be traversed; then there was a long and precipitous descent to a desolate valley; now a morass was passed, now a torrent forded; at one time we crossed a natural bridge, overhung on one side by a huge cavern, and on the other dropping suddenly to a deep ravine; and so riding onwards and downwards, we drew slowly nearer to our resting-place, and to the sea, still several thousand feet below, until a sudden turn of the path brought us to the village of El Mnetira, and in full view of the most magnificent waterfall of the Lebanon, the Fountain of Afka.

We rode over the bridge to the other side of the river, and passed the evening on the river's bank, amid a scene of entrancing beauty. Above, from a limestone precipice, rushed the Fountain of Afka, dashing in three wild leaps from the cave to the river Adonis below, its dark waters transformed in the brilliant moonlight to a glittering fall of silver. High up in the face of the cliffs, lights were seen moving to and fro; and on inquiring, we found that there were passages in the rocks, and that the shepherds, who used these passages for housing their flocks, were passing up and down to see that all was well. We had time to call to mind the legend of Venus and Adonis, which tradition assigns to this spot; close by are the ruins of a temple of Venus; and it was here that the maidens of Lebanon came once a year to chant a lament for Adonis: 'I mourn Adonis—the beautiful Adonis is dead!'

On the third day we gradually left the wilkness, to which we had become accustomed, and our way lay by fields of springing corn, past terraces of apple and mulberry trees, until we entered a valley piled throughout its entire length with extraordinary masses of limestone rock. These rocks, whose softer parts have been worn away by the action of many storms, have formed themselves into grotesque groups, and in some cases with so near a resemblance to a town, that, until we were close to them, we were under the impression that we were approaching an inhabited and fortified place, with battlements and towers standing clearly out against the sky.

That night we camped at Ajeltun. This last night in tents was destined to be exceedingly uncomfortable, for, shortly after we had retired, the wind suddenly rose and threatened to overturn the tents; and the men were kept hard at work throughout the night hammering in the tent-pegs and piling stones on the ropes to keep them taut, and the continual hammering effectually kept us awake.

The next morning we mounted our horses for the last time, and rode slowly down the paved steps of the old Roman road. At every turn vegetation became more and more luxuriant; the ground was carpeted with flowers, and on all sides rose groves of orange and mulberry trees. We passed many a prosperous town, with its white churches and convents standing out against a background of pines; its large house, belonging to the sheik, surrounded by the dwellings of his dependents; and always we descended by precipitous paths, until at last we reached the foot of the hill from which flows the 'Fog River.'

Having passed beneath rocks inscribed with the

names of Assyrian and Roman emperors, and under the old Roman aqueduct, with piers curtained by tall grasses, and arches fringed with maiden-hair fern, we turned the corner, and came upon this inscription, printed in large letters, on the cliff: 'London Waterworks Company;' and then we realised that we had left the romantic and returned to the commonplace. A few hours' ride, first along the level sands, and then on the Damascus highway, brought us to Beyrout, where we dismounted at the 'Belle Vue Hotel,' and resigning our steeds into the hands of their attendants, realised with regret that our four days' ride in the Lebanon had become a thing of the past.

THE SACRED BEETLE.

CHAPTER IV.—CONCLUSION.

THE next day, the little pleasure party had broken up. I need scarcely remark, by the way, that Mr Cotton, with praiseworthy honesty, but considerable trepidation lest his temporary appropriation of the Doctor's scarab should have been discovered, had, unobserved, replaced the 'nasty, stinkin' bug' in the place where he had found it. Only three of the community we have become acquainted with remained at Shephard's, namely, Miss Emerson, the Masher, and our hero. The Parson had swept his helpmate away in a torrent of conjugal indignation; the Misses Jenkins had departed for Alexandria *en route* to Italy; and Mr Cotton had found that he could no longer stay away from 'Hengland' and the rise and fall of the money market: he wished to be on the spot. But before dismissing him from our pages, it is only fitting to remark that he never forgot that last evening on the Nile boat and the attentions which were then paid him. Until he married, he used to rhapsodise on the 'doocid fine women' who appreciated his wit and lively conversation. On his attempting, however, some weeks after his marriage, to enlarge on the subject and glorify the occasion thereof, he met with such a sarcastic rebuff from his wife that he relegated the little episode to the pages of the past, which are usually kept turned down and under lock and key. As for poor Miss Priscilla Jenkins, she never forgot the handsome Doctor; and even the snappish Miss Hester would at times regretfully dream of 'those lovely eyes.'

It was at this time that Dr von Eberstein made the acquaintance of Colonel Merritt, and related to him what the Colonel called 'the richest joke he ever heard.'

The intimacy between Miss Emerson and the Professor grew apace. He discovered in her a kindred mind, a breadth of perception and thought which he had never expected to find in a woman; and she, recognising his sterling qualities and honesty of mind and purpose, thought more highly of him from day to day. I believe the Masher stayed on partly from curiosity, and partly because he wished to see whether the other ladies at the hotel would behave towards the Professor in a similar fashion to those who had been on the boat with him. He was not disappointed. The unhappy German became, much to his embarrassment, the lion of the hotel,

and would at times seek refuge in his room, where he smoked incessantly, and tore his hair with bewilderment.

One fine evening, Miss Emerson and Von Eberstein were strolling in the garden, when the former said quietly: 'Doctor, I have never seen what it is you always carry in that little box in your waistcoat pocket. Will you show it to me?'

'Certainly, my dear lady.' And he extracted the bronze scarab and laid it in her palm. As he did so, it seemed to both as though an electric shock had passed through them. The Doctor's heart rose to his lips, and the words he had for weeks been longing to speak came flowing forth.

'Miss Emerson, I am but a poor German Professor, but I love you very dearly; you must have seen it. Have I any hope that you will return my affection?'

She was silent for a while, twisting the little beetle this way and that in her hand. Then: 'Are you in earnest, Doctor von Eberstein?'

He drew himself up bravely before her. 'I am so much in earnest, Miss Emerson, that I have come to regard you as a part of my life. I am not good at fine phrases; my life has been passed in study. But I can honestly and truthfully declare to you that I have never said to any woman what I have now said to you. If you reject my suit, I do not say, as some do, that I shall go to the dogs or do anything foolish. Nè-è! That would be cowardly. But I do say that in that case I will never ask another woman to share my life with me. It is a poor life, but I lay it at your feet.'

She was silent again for a few moments, and then, turning to him with a bright smile on her face, said: 'I believe you, Carl; and I will trust myself to you.'

With a slight ejaculation, he drew her into his arms and kissed her: 'It is our betrothal,' he said.

During the next half-hour, as they paced to and fro, he confided to her the whole secret of his journey to Egypt, and showed her the ancient parchment which had led him to undertake it.

She mused awhile, and then asked: 'So you do not know the powers which this little scarab is supposed to possess?'

He shook his head solemnly.

To his astonishment, she broke into a peal of ringing laughter. 'Oh, Carl, how stupid you are! Why, I guessed them at once. Now,' she continued, 'you just lock it up and don't carry it about with you until you are allowed.' And she returned it to him. Again that electric shock seemed to flash through both. 'Now you notice how the ladies will treat you.'

That evening, sure enough, Doctor von Eberstein was left in peace. He was not the recipient of embarrassing attentions from the feminine portion of the community, and he was devoutly thankful therefor. He didn't understand the reason; but he had his orders, and that was sufficient for him. After some days of this rest and quietness, his mistress commanded him to come down to dinner with his scarab in his pocket. The old annoyance was promptly revived, and the badgered lover could not obtain

five minutes' uninterrupted conversation with his fiancée, who seemed to enjoy his predicament.

The next morning she asked him with a smile : 'Well, cannot you now guess at the peculiar properties of your scarab ?'

He answered slowly : 'I do not *know*, but it seems to me that whenever I have it about me, I am most troubled with unwelcome attentions.'

'Of course that's it ! Don't you see that whoever is its possessor is an object of attraction to the other sex ?'

'So-o-o ?' said he, thoughtfully, with the long German drawl. 'Then I shall lock it up, and no one shall carry it about.'

'Lend it to me, Carl,' said Miss Emerson with a wicked twinkle in her eyes.

'Nē-ē ! Gott bewahre !' he replied hastily.

'But I want to have some fun with it.' And after much coaxing, she had her own way.

Miss Emerson took a malicious delight in showing the little antique to the oldest and ugliest people in the room, and then casually begging them to retain it for a short time until she returned. Then, accompanied by Von Eberstein and Colonel Merritt—who now participated in the secret—she would plant herself in some quiet corner and survey the effects of her practical joke, which were as amusing to her co-conspirators as herself. Old men and young men, all deserted their partners, and clustered round the delighted but bewildered possessor, for the time, of the talisman. The younger ladies were furious. Then Miss Emerson would glide softly up to her victim and reclaim her scarab, thanking the unfortunate individual most affectionately for having taken care of it ; and then the galaxy of advisers would desert the elderly lady, and hover around Miss Emerson until she gave up the lodestone to Von Eberstein and bade him lock it away.

As the period of our hero's leave approached its expiration, he reminded his fiancée that she had promised to return with him to Germany as his wife. She acquiesced in the reasonableness of the proposition ; and a month later there was a very pretty wedding. I don't know whether she wore the scarab about her somewhere, but it was certainly a fact that the male portion of the spectators of the ceremony unanimously declared that the bride was the loveliest woman they had ever set eyes on ; while the ladies eulogised Doctor von Eberstein's looks, and his eyes in particular. The couple may have worn it turn about, but I can't say.

On the second evening out from Alexandria, Doctor and Mrs von Eberstein were leaning against the bulwarks of the big steamer, listening to the measured thud of the screw, and watching the calm moonlit sea as they sped along.

'Carl, dear,' said Mrs von Eberstein, 'do you place any great value on that little scarab of yours ?'

'Why, no ; not now,' he answered. 'I think it is a very dangerous possession for any one. I shall never dare to tell the story of it, for I should not be believed, nor would I care to try its powers any more.'

'Have you got it about you now, dear ?'

'Yes—in my waistcoat pocket, as usual.'

'Kiss me, Carl.'

And as he took her in his arms, her deft fingers slipped into his waistcoat pocket and brought out the little box.

'You will always love me, Carl ?'

'Always, my dear.'

'Then'— And she stretched her arm over the vessel's side ; her fingers opened ; there was a momentary flash of light, and the Sacred Beetle had vanished for ever from human eyes.

OUR BANK.

BY DEPOSITOR NUMBER ONE.

THE old Lady of Threadneedle Street does not concern herself about Our Bank, neither do the makers of guide-books for London ; therefore, it is not necessary to point out the exact locality in which it stands ; suffice it to say that it is attached to a fairly prosperous Co-operative Society, and is of the genus known as 'Penny.' The founders of our bank were men of simple minds and kindly hearts, who thought it, right, with the intent of 'teaching the young idea,' to decorate the inside page of the little deposit books with homely mottoes, or, as they called them, 'good words.' 'A Penny saved is a Penny gained.'

'If youth did know what age would crave,
Many a shilling youth would save.'

'There is many a poor creature now crawling through life, miserable himself, and the cause of misery in others, who might have lifted up his head and prospered, if he had begun early to save his pennies.' And others of a like character. One—the last on the list—having a peculiar attraction for the eye by reason of its quaint emphasis : 'Resolve never to be poor. Whatever you have, spend less.'

Years have rolled by ; perhaps dignity has grown with numbers ; our depositors are now counted by thousands ; but is it, one wonders, to the advantage of the present generation of 'young ideas' that these trite and homely sayings have been discarded, and their places filled with rules and regulations couched in legal phrases ?

If one were to ask a small depositor in the motto days, 'What is written inside your book ?' out would come the sayings in a string. But ask the same question to-day, and it is safe to guarantee that not one in twenty has read the rules, let alone committed them to memory. After all, the rules of our bank are but few, and anything but stringent ; and perhaps it is this absence of red-tapeism which makes it popular among a class not generally credited with thrifty habits. 'Arry and 'Arriet are not fond of the Post-office Bank, for instance, with its documents and signings ; but they like our bank—' 'Cos yer can 'ave yer money out w'en yer wants to without any fuss.' And they do have it out too. No need to refer to an almanac to tell when bank holidays are near—a glance at the withdrawal column of our

ledger is quite sufficient. One must confess that 'Arry and 'Arriet are not permanently thrifty, and that the sums they save seldom amount to pounds; but again and again the effort is made to 'get a few shillings by' in view of a rainy day or special event. The amounts entered also vary in accordance with the financial barometer for the time being. 'Can't spare more this week, gov'nor,' and twopence is bounced down on the desk with an 'I-care-for-nobody' air that is quite refreshing.

The laws governing Our Bank dictate that not more than five shillings shall be received as one deposit; but we feel much inclined to break this law when our friend comes one week with six or seven shillings, and says, when the regulation is pointed out to him: 'Oh, well, I may as well chuck the other bob away, for it's bound to go.'

At the present moment there is a Bill before Parliament which proposes to raise the amount receivable to ten shillings. If this becomes law, it will be good news to our friend and others of his class.

Perhaps the best example of the notions of thrift entertained by this class of depositor, is furnished by the young man who appeared at the desk one evening sans collar—and probably shirt—and proffered this request: 'I-warnts-ter-shuv-in-er-bob-en-pull-it-art-(out)-ergin-nex-week.' Being learned in the vernacular by long training, we were able to translate this to mean that the young man desired to deposit one shilling and withdraw the same at a week's notice. Not wishing to discourage even this spasmodic effort at saving, we took the 'bob,' giving in return a little homily on the value of a more continuous system; but, unfortunately, we have forgotten whether the homily took effect, or whether the bob was 'pulled out,' as desired.

Not all our depositors are of this rough-and-ready shiftless type, of course; but they predominate, because the neighbourhood round Our Bank is known as a poor, not to say low, one. There are several well-known persons—known to the police, that is—who habitually use Our Bank, among them a whole family of burglars, several of the members of which do not require to save at the present time; also several nice old ladies, whose periodical visits are a thing to be dreaded, so powerfully does the odour of their favourite beverage pervade them. One could hardly be civil, for instance, to the old creature who says, with what she, no doubt, takes to be an insinuatingly friendly manner: 'Please, my dear, let me have a book for my dear little boy; he's gone to his dear little school, and I wants to save his dear little ha'pence for him till he comes back.' It was a known fact that the 'dear little boy' in question was spending his time in a Reformatory, and that the 'dear little ha'pence' would be wanted in a week or so to help to prepare our old friend for a visit to the lock-up; so the book was handed over without comment, and with the best grace possible under the circumstances.

It is frequently matter for speculation as to where some of our depositors keep their books when they do get them, they acquire such an exceptional degree of dinginess. How exceptional, may be gathered from the fact that it is almost impossible to touch them except with the extreme tips of one's fingers.

However, the struggles of poverty in its easier moments to defend itself against the more direful strain of the inevitable rainy day, are often too pathetic for laughter or scorn; and many are the tales of valiant striving to keep heads above water which reach the ears of those who officiate at Our Bank.

There is a necessary rule that for all sums withdrawn a certain specified notice must be given; but need it be said that this rule is often broken. One week out of work and the cupboard is bare, and 'If you can't let me have it to-night, I must pawn his things for bread;' or, 'I haven't another penny in the world' is the too frequent pleading. Be it noticed that the money is never demanded, always asked for, often with a humble apology, quite unwarranted, except for the knowledge that our bank is too great a convenience to be misused.

There is quite an amusing display of gratitude expressed by some of our depositors, even when entering in their moneys. One old Irish washerwoman, with a face as round, rosy, and clean as a pippin, and a smile as bright as a summer day, always drops a funny little curtsy when handing in her book and money; and says, 'Thank ye kindly, sir,' when receiving it back with the item—which, by the way, she is unable to read—duly entered. There is another Irishwoman who, some years ago, was left a widow with two or three fatherless children. She was poor, ignorant, and, one must confess, dirty; but she determined that her 'childer' should have some chance in life, if possible; so every penny she could scrape or they could gather was put into a book for each child, never to be trespassed upon until wanted to give them a start out into the world.

Some months ago, she came with pride to draw several pounds.—'The first I've ever touched'—to get her girl an outfit before sending her to an Institution where she would be taught a useful trade. 'Now,' said she, 'I've only the boy and little one to bring on.'

These people are among our regular customers; and we have now been established long enough to see a whole generation of small depositors pass through the stages of boy and girlhood to man and womanhood, bringing in turn other small depositors to carry on the line. One's recollections of some of these depositors are very vivid. For instance, there was the little old lady whose delight it was to open a new account for each grandchild immediately on its arrival in this vale of tears!—once, before the young person had even a name—and whenever opportunity served, she would dilate on the beauty, cleverness, and progress of each child in turn. At last there were as many as ten books, the right disposal of the pennies in each of which was a source of great excitement to her and considerable hindrance to us. By-and-by, as years went on, the children were able to relieve grandmother of her task occasionally, and presently her visits became few and far between—the walk tired her, she said;

and now, for some years, she has not been at all, and we have lost trace of her. The children may still be among our depositors, but one fancies that it was our old friend's personality and her fond love which gave them any individuality, for it would be hard to pick them out now for any cleverness or beauty above the average.

Then there was the bright lad whose open handsome face won our regard. It wanted only half a word to draw from him all his hopes and aspirations and the details of his daily life. Presently, he finds a place in a City office, and with delight tells the amount of his salary and the fact that the money deposited is saved by walking to town each day. By-and-by the amount dwindles to a very small sum. 'Only wears out shoe-leather to walk, you know.' As his collars grow in height and cuffs in length, so his deposits decrease in number, till he only appears at rare intervals to make deposits for brothers and sisters. When questioned about himself, he says with a jaunty air, 'What's the use of saving? Let's make the most of things while we have them, I say.' He, too, has not been to Our Bank for some time; can it be that the pernicious philosophies of City life have completely taken hold of his bright confiding nature? One hopes not, sincerely.

Then, as an instance of development in another direction, we remember the young lady who suffers under the possession of an abnormally developed nasal organ. This feature when large, is popularly supposed to indicate strength of character; but, in the strict canons of art, does not conduce to perfection of beauty; and when this young lady first began to attend Our Bank, no attempt was made by those in charge of her to minimise the inharmonious effects of her too prominent feature by the assistance of art in dress. She generally appeared in a small round hat, and with her hair strained back from her face and done up in a tight plait at the back. As she grew older, however, and could take these matters into her own hands, one soon noticed a difference. The hair was brought forward and allowed to fall loosely round the face; a large shady hat replaced the small round one; and she generally contrived to have some show of white, or a loose fluffy scarf round her neck, so that to-day her erstwhile defect serves but to give her a pleasantly striking personality.

Occasionally, Our Bank gains a tinge of romance, when we find a young man and woman with different surnames who have been industriously accumulating capital for some time, giving notice to withdraw simultaneously; and we discover that they require the money to set up house-keeping together. It is a singular thing, but the officials of Our Bank seem to have an intuitive understanding when the money is wanted for this purpose; there is an ill-concealed smile on the faces of the withdrawers, which tells its own tale; and we generally try to add a trifle of interest in the shape of a congratulatory word.

A novelist in search of names for his characters might do worse than dip into the ledger of Our Bank. It goes without saying that there is rather above than below the average number of Tom Smiths and John Joneses; but we consider 'Temperance Sherry' and 'Temperance Allport'—the latter surname being acquired by marriage—to be somewhat unique. It is possible to make a regu-

lation make-a-fuss-about-nothing-and-live-happy-ever-after heroine of 'Clare Mildmay' or 'Jessie Jenkinson'; to invest 'Jeanette Ducrane' with fierce and dark passions, or to turn 'Malanie Turpen' and 'Kathleen Killeen' into heroines of the harum-scarum order. 'Absalom Hake' and 'Abigail Knock' are of the uncompromisingly severe type; but one almost hopes that 'Primrose Wood' will never change her surname, so charming is the suggestiveness of her quaint cognomen. 'Philadelphia Grubby' we count one of the curiosities of nomenclature.

Our depositors, as a rule, are not burdened with a superfluity of Christian names. Frederick Williams and Mary Janes of course abound, but they sometimes manage to arrive at good combinations, as, for example, the delightfully alliterative 'Richard Roland Radford.' Of surnames we have whole families of 'Muddles,' 'Wadlings,' and 'Grubers;' and there used to be a 'Pitchfork' among our members.

Have we ever been defrauded? One or two attempts have been made by means of forged entries to swell the withdrawable balance; but our depositors are not skilful in the use of the pen, and the forgeries have been instantly detected. Once Our Bank was made the medium of an impudent and ingenious fraud on tradesmen in the neighbourhood; but the offender was soon brought to book. Quite recently, a lad with a passion for the sea managed to raise the means of getting his heart's desire by stealing his father's deposit book and withdrawing the money; but such cases are remarkably rare.

The directors of Our Bank do not indulge themselves in an annual dinner; but every now and again they give the juvenile members an entertainment in the shape of a magic-lantern show, accompanied by a generous distribution of buns, oranges, and sweets, and wild is the excitement when the tickets are given out.

The rebate of Board School fees had an immensely stimulating effect on the business of Our Bank, a large number of new accounts being opened.

Many of the early promoters and most zealous voluntary helpers at Our Bank have passed away; but were they aware of our present position, they would rejoice, we feel sure, in the success resulting from their earnest efforts. Our Bank has touched a class who would not perhaps be reached by any other agency, a class too independent to brook 'charitable' assistance, and too unlearned to take easily to the Post-office.

While we have spoken most about what may be termed the intermittent depositor, there are still very many who have persisted in a regular course of systematic saving; and if the final result is not riches, yet the limit allowed by the law—twenty pounds—has been over and over again reached by the most unlikely-looking depositors.

It is estimated that in banks similarly attached to Co-operative Societies there are now over one hundred thousand depositors, holding a capital of over one hundred and fifty thousand pounds; yet the chief value of these banks is felt to be, however, not so much in this accumulation of capital, as in the aid they afford to preparation for the hundred-and-one small exigencies of everyday life, and in the teaching they almost un-

consciously give in habits of forethought and thrift. For this, if for no other reason, one may say, as we feel sure our old Irishwoman would say, 'Good luck to them.'

THE MONTH: SCIENCE AND ARTS.

THE World's Fair at Chicago marks an era in human progress which will not be soon forgotten. On account of its vast size and comprehensiveness, it will stand out from all enterprises of the kind, and will create as much sensation in the civilised world as did the prototype of all International Exhibitions in 1851. In one respect it far outshines its fore-runners, and that is in its display of electrical applications. In the last twenty years the applications of electricity have been marvellously developed; so much so, that many new and important industries have sprung up from it. Of these we need only mention the telephone, the incandescent carbon filament, and electric traction for railways. These inventions alone will make the closing years of the nineteenth century ever memorable, and they are worthily illustrated at the great Exhibition at Chicago.

Increased swiftness in ships—the substitution of iron and steel for wood—steam and the screw propeller for the unbought wind—these all demand improvement in the manner of fixing a ship's position on the waste of waters. Lieutenant W. H. Beehler, United States Navy, of the Washington Hydrographic Office, has devised an instrument to be known as the 'Solarometer,' by means of which a ship's geographical position and the error of her compass may be obtained directly by observations of the heavenly bodies, whenever visible, without having to make the usual elaborate computations. Star observations are too frequently disregarded, and the sextant is useless when the horizon is obscured, even though the sun shine brightly in the celestial concave. The Solarometer will be specially valuable in just such an emergency, for it is rare that a star is not visible for a few moments on any given night, and the horizon no longer requires consideration. Safety of large liners will doubtless be ensured by the use of the Solarometer; but, inasmuch as three hundred and eighty pounds of mercury are required, it is not improbable that its weight and cost will militate against general adoption by navigators.

The German Admiralty have recently adopted a flashing light for signalling purposes—the invention of Professor Schevin—the principle of which is a stream of powdered magnesium, which is caused to fall into a benzine flame. The flashes are so bright that they are said to be visible by daylight at a distance of six miles, which statement is probably an exaggeration. We may mention that a lamp very similar to this, in which a powder consisting largely of magnesium is propelled into a spirit-flame, was devised about sixteen years ago in our own country by Captain Colomb, and was, if we remember rightly, approved by our Admiralty and adopted by them. The recent use of the flashlight for photographic purposes has, doubtless, renewed attention to this method of signalling.

A writer in an American paper called 'The Rural New Yorker' dwells upon the advantage of soaking potato-seed tubers in a solution of corrosive sublimate previous to planting, as a sure remedy against the blackened condition of potatoes known as potato scab. He asserts that the disease is due to a parasitic cause which operates from below, and that, therefore, the common expedient of spraying the plants is simply a waste of energy. The paper is illustrated by photographs, which show the condition of the doctored tubers and those which were untreated side by side; and it is pleaded that the treatment is easy of application, and results in an increased yield of potatoes. The plan recommended is to soak the seed-tubers for one and a half hours 'in a one-one-thousandth solution of corrosive sublimate.' It is not quite clear what strength of solution is here indicated; if it means one part of the salt in one thousand parts of water, this would be equal to one ounce to six gallons, which would be, we should think, needlessly strong for such an active poison.

Weather forecasts are being promulgated in New England in an altogether novel manner. On the summit of Mount Washington, an electric search-light is placed, and flashes its warnings over the surrounding country, the signals being well seen at a distance of eighty miles. From Boston the local forecast official sends out daily three hundred printed copies of weather forecasts for the next twenty-four hours. These go by rail, and are dropped at the various stations *en route*. At these stations the forecasts are immediately displayed, each in a frame provided by the Weather Bureau. It is found that this is the quickest method of bringing the forecasts under the notice of the public.

We have already noticed in these columns the introduction of what is called a Hydrocycle, that is, a boat which is propelled by paddle-wheel or screw worked pedal fashion by the occupant or occupants. Such a vessel with a crew of three can now often be seen on the reaches of the Upper Thames, accomplishing with ease a speed of six miles per hour; and this same hydrocycle has recently distinguished itself by beating the sculling record for the journey between Oxford and Putney, a distance of one hundred and two miles. In this journey there are thirty-one locks, and the delay in getting through them is often very vexatious. The sculling record was a trifle over twenty-three hours; but the hydrocycle covered the distance in nineteen hours. It would be interesting to know whether the work of propelling this novel form of boat is more or less exhausting than rowing. Possibly, this would be a matter governed by individual temperament and habit.

The Special Commission appointed under the auspices of 'The Lancet' to inquire into the water-supply and drainage of the city of Chicago, in view of the numbers of persons attracted by the World's Fair, reports that the water, taken from different points on Lake Michigan, is free from objection, provided that due care is exercised in filtering it, and that the water be cooled without contact with ice. It is obvious that if ice of unknown origin be placed in water to lower its temperature, previous filtration is rendered futile.

In a country parish not far from London a new form of water-cart may be seen in action, which seems to us a distinct improvement upon the ordinary kind. The water from the cart is discharged into a trough, below which are two horizontal partitioned wheels, which revolve at a rapid rate, and are geared to the main wheels of the cart. The water as fast as it runs upon these wheels is cast abroad in fine spray by centrifugal motion. This is a far more effective manner of laying the dust than the usual plan of flooding the road with water. Cyclists especially will rejoice in a method of watering which stops the dust without waterlogging the roads and making their progress slow.

Mr Watson Smith recently delivered before the Chemical and Physical Society of University College, London, a lecture on Diseases incident to Workpeople in Chemical and other Industries. With regard to that terrible disease of the jaw (necrosis) which attacks workers with phosphorus, the author tells us that the danger is far greater in the match factories than in those where the phosphorus is made. By using red or amorphous phosphorus, such as is now the custom in manufacturing matches which strike only on the box, all risk of disease is obviated. It is mostly in the small factories abroad where the yellow phosphorus is used, and it is impossible to stop the mischief without State interference. Referring to the new method of white-lead manufacture in which the carbonate gives way to the sulphate, the lecturer pointed out incidentally that the sulphate would be converted into carbonate by sodium bicarbonate. Hence, if a person is exposed to the dust of lead sulphate, a draught of the ordinary effervescing beverages may at once produce in his digestive organs the actively poisonous lead carbonate.

The 'Pathfinder' is a novel vessel which has been designed and built by Messrs Merryweather, the well-known fire engineers, and its purpose is to act as an hydraulic dredger, a floating fire-engine, or as an appliance for pumping out submerged ships. At its bow is a well, through which can be sunk a telescopic tube of copper, the other end of which is connected with a powerful steam-pump. This tube delivers a powerful jet of water upon any shoal which requires deepening, and very quickly removes it. At a recent trial on the Essex coast, five different portions of a shallow were thus operated upon in thirty-two minutes, an average increase of depth of eleven feet being obtained; and the amount of excavation was roughly estimated at one hundred tons of solid matter. It may be pointed out that by this system and by working at ebb-tide, the matter removed from a water-way is carried away piecemeal, and deposited over a large area; there is therefore no necessity of taking away the removed soil in barges, as is customary in other methods of dredging.

It is said that an experiment was lately made at West Lynn in order to test the tractive power of electricity against steam. A locomotive engine was coupled to a large electric car, and at the same moment they were started in opposite directions. At first, neither gained any advantage; but when sand was thrown on the track, the electric car gained the victory. We are sorry that no more details of the experiment are forth-

coming, for it would be interesting to learn the indicated horse-power both of the locomotive and of the steam-engine which furnished energy to the dynamo on the electric car.

While in this country we have been mainly exercised in the problem of heating railway carriages, Indian engineers have been endeavouring to find some satisfactory way of cooling them. The latest device for this purpose is described in an Indian technical journal, and consists of an automatic arrangement by which curtains suspended across an open trap-door in the carriage are kept saturated with water. These curtains are let down over the fore-end of the carriage, covering the trap-door in whichever direction the train is travelling. In addition to this arrangement, there is a revolving punkah fitted with fans, which is kept in constant motion while the train proceeds on its way.

A French paper recently pointed out that although asbestos was known by the ancients, who used it for crematory purposes, and although in more recent times it was spun into tablecloths, serviettes, &c., its applications were very limited until a few years ago. Twelve years back, not more than four articles were made of asbestos, whereas now at least one hundred things are made from it, and the list is ever extending. One of the most interesting and important applications of the material is in connection with ceramics, and it is believed that asbestos pottery will presently become very popular. The earthenware made from it has a peculiar fineness of grain which is unapproachable by any china-ware, and it can be made into statuettes, or enamelled so as to present a very attractive appearance. Asbestos pipes are highly appreciated by smokers; the material can be used for filtering the strongest acids; and as an insulator for electrical purposes it is unequalled. Asbestos is found in Siberia, the Tyrol, the Pyrenees, Greenland, Brazil, and Canada. There is no dearth of it, and its applications are on the increase.

It is generally known that when the junction of two dissimilar metals is heated, an electric current is generated; and upon this observation, made by Seebeck in 1821, many thermo-electrical devices have been based, some of these yielding sufficient electrical energy to be turned to practical account. A new form of thermo-electric stove has recently been described by a correspondent of the 'Times,' and it is said to be capable of furnishing both heat and light for a room twenty-one feet square. The stove is about three feet high and twenty inches in diameter, and contains the metallic bars, which, heated on the slow-combustion principle, furnish current sufficient to light six glow-lamps each of eight candle-power. During the daylight hours the current from such a stove can be stored in accumulators and used when required. This Thermo-electric Stove is the invention of Dr Giraud, and can be seen at work at the office of Messrs Renshaw & Co., of Queen Anne's Mansions, Westminster. The fuel consumption is said to be only forty pounds of a mixture of anthracite coal and coke per twenty-four hours.

Some very interesting 'Notes on Gesso-work,' by Walter Crane, appeared in the May number of the 'Studio,' and it is there indicated that there is a revival of this form of art decoration, which

is aptly described as being midway between painting and sculpture. There are many ancient examples of this beautiful form of decoration, which doubtless found its birth in Italy; but its most popular modern exponent is the pastry-cook, who by similar means decorates with liquid sugary compound the 'iced' surface of a bride-cake. Gesso is a mixture of whiting, glue, and resin, or similar materials, which is employed in a semi-plastic and semi-liquid condition, so that it may be trailed from a brush so as to form lines, or masses which can be built up on a flat surface so as to produce forms of any required kind. The article referred to is illustrated by some beautiful examples by the author, and this method of decoration is shown to produce very fine results. The necessary material is now sold in the form of a powder, which only requires to be mixed with water to be ready for use.

The manufacture of silk from wood-pulp would seem to be at first sight as mythical as the extraction of sunbeams from cucumbers; but it is a simple fact that the work is now being accomplished, and that a mill for the manufacture of the silk is in full operation at Besançon. The process is that of M. de Chardonnet, and is described in detail in a recent Report by the United States consul at St Etienne. It may be summarised as follows: The wood-pulp, such as is employed in paper-making, after being carefully purified by acid and dried in alcohol, is dissolved in a mixture of pure ether and alcohol, thus forming a viscous collodion like that used in photography. This collodion is placed in a vessel, where, under air-pressure, it is first of all forced through a filtering apparatus, and then into a horizontal tube having a number of glass exit tubes of very small bore. From these tubes the collodion issues in threads so fine that six of them must be combined to make a strand of the necessary consistency for weaving. On its exit, the thread passes through a vessel of water, which robs it of its surplus ether and alcohol, and thus helps it to become solid. It is also subsequently passed through a bath of ammonia, which takes from it its highly inflammable properties. It is believed that this silk has a great future before it; but whether it will prove a dangerous rival to the product of the silkworm remains to be seen.

The Meteorological Society is anxious to secure the co-operation of amateur photographers throughout the country in forming a collection of photographs which it is thought may be useful in helping to solve many problems connected with that branch of science to which it devotes attention. Firstly, a collection of groups of cloud photographs is wanted, from which it is hoped a better cloud-nomenclature can be drawn up than the one which now obtains; and more especially are required those delicate breaths of vapour known as cirrus clouds, which are so often seen high overhead. Hints on the best way of securing these difficult objects can be obtained from the Society; but we may mention here that the best results are obtained by using a mirror of black glass as a medium for reflection between objects and lens. The appearance of the bolder forms of cloud on the approach of a thunder-storm will also form valuable photographs. Beyond these, pictures of lightning are asked for, and pictures of any kind which afford evi-

dence of atmospheric disturbances. Photographs of damage resulting from floods, unusual wind-storms, and the like, will also be acceptable. We feel quite sure that many amateur photographers, whose usual work is of a comparatively aimless character, will be glad to join in a scheme which will give them the consciousness that they are contributing to a good cause.

To those who have an interest in the preserving of fresh eggs, the following notes from a correspondent may be useful: 'Last year we had some eggs, as an experiment, rubbed over with vaseline, and then packed in boxes with dry salt. The boxes were turned over every fortnight, to prevent the yolks settling and adhering to the shell. After the lapse of four months, the first box was opened, the eggs wiped clear from vaseline, and they were then boiled along with fresh-laid ones. As a matter of actual fact, it would have been difficult to distinguish one from the other, if we had not known that some of the eggs had been preserved. This year we commenced preserving by the same method only eight weeks before the time at which I write; and although the test is a much shorter one, it is quite sufficient to prove the value of the process. The fortnightly turning over is an essential feature, as it keeps the yolks in position; and the impossibility of doing this with lime-water, brine, or any wet method, condemns these at once, on account of the adhesion of the yolk to the shell, irrespective of the flavour, which with most other processes is not at all satisfactory. The result of our test this year is as follows: The first lot of eggs preserved were laid March 12th, and were rubbed with vaseline and covered with salt on the 13th; the lids of the boxes were then tied down, and the boxes turned upside down every fortnight or so. Eight weeks afterwards, the first box was opened; two eggs were poached and found perfect; two were boiled for two different persons who are in the habit of taking a new-laid egg daily. One of these two persons, not knowing the egg was a preserved one, remarked that it was very fresh and nice, but that the hens must be getting short of green food, as the yolk was paler than usual. This remark proved clearly that the egg was not passed over without critical notice; and the fact that the yolk was pale is easily accounted for, as during March the hens were practically without green food, they being kept in confinement, and depending for green stuff on the garden waste and grass-cutting from the tennis lawn. The eggs had the curdy, milky appearance which fresh-laid ones lose in about two days, and also the inimitable flavour peculiar to those which have not been handled much.'

THE NEW WELDLESS CHAIN.

THE use of chains dates far back into the world's history; gold chains being frequently mentioned by the earliest Egyptian chroniclers. Turning, however, to modern times, the first extant published patent for chains was obtained in 1634 by a blacksmith named Philip White, who sought, in his own words, 'a way for the mooring of shippes with iron chaynes by finding out the true heating ppareing and temping of Iyron for that ppose, and that he hath nowe attayned to the true vse of the said chaynes, and that the

same will be for the great saving of corlage and safety of shippes, and will redound to the good of our common wealth.' White was granted a patent for fourteen years, and paid five pounds per annum to the Exchequer at Westminster for protection in making his 'chaynes.'

The use of iron chains for mooring purposes in the British navy was advocated in 1690 by Sir Cloudesley Shovel; but it was not until the commencement of the present century that their use for vessels became general, when, in the hands of numerous hard-headed, shrewd mechanics and inventors, the chain reached its present form and perfection, though it was some little time ere prices reached reasonable limits.

It is on record that a vessel, built at Monkwearmouth in 1809, had one chain cable, costing forty-three shillings per hundredweight; indeed, such price was deemed very moderate for those days; for in 1811 chain cables averaged sixty pounds per ton, a rate which has gradually fallen to about twelve pounds or less per ton at the present day.

Viewing the importance of the chain industry, special interest attaches to attempts now being made to introduce into the market a new class of Weldless Chain—namely, one whose links are formed in such a manner as to require no joint whatever. The strength of a chain is proverbially that of its weakest link; and in like manner the strength of the link itself is that of its weakest part—namely, the weld or joint; and no further comment is necessary to demonstrate the superiority of a chain made up of links having no joint or weld whatever; whilst, owing to the absence of such welding, a class of steel of much higher carbon, and therefore increased strength, can be used, those steels which weld well being the softer and weaker qualities.

The design of the links of the new chain is exceedingly ingenious: the wire to form the link is bent into the shape of an elongated U, the ends of which are passed through the next link, bent back, and finally twisted on themselves in such a manner as to leave no danger of slipping loose, nor, the ends being left pointing inwards, is there any danger of their fouling anything.

The chain is called by the makers the 'Triumph;' and experiments have lately been made by Professor Hele-Shaw, of University College, Liverpool, as to the comparative strength of the weldless and welded chains. The strength of the new chain is remarkable, owing to the absence of all welding; and careful and reliable experiments have demonstrated it to have a breaking strain nearly double that of the single section of steel out of which it is made, and approximately three times that of the best British welded chains.

The facility presented by the new chain for speedy expedition and economical manufacture forms a powerful factor in its favour, no fewer than a dozen machines being readily controlled by a single man assisted by one boy. These machines—which in themselves mark an important advance in the chain industry, for up to the present time welded chains have been made mainly by hand—exhibit great ingenuity in their design; and the facility with which they convert reels of wire into fathoms of the new weldless chain leaves little doubt as to the success of the

invention we are now enabled to lay before our readers. The rapid demand for their product in America has induced the patentees of the new chain to effect arrangements for laying down works in this country; and it is anticipated that an establishment at Liverpool will shortly be in active operation.

Without entering into details, or unnecessarily going into the minutiae of quotations, we may briefly say that the new chain will be placed in the market at less than one-fifth the price at present ruling for a welded chain of equal strength; whilst, moreover, the new chain would only weigh about one-half the weight of the welded, a desideratum of no small moment when large quantities have to be handled and carried.

Enough has been said to demonstrate the value of the new weldless chain, and to emphasise the far-reaching benefits to accrue to every industry using them, as well as to the public at large, from reduced cost, coupled with diminished weight and augmented strength.

A TRANSFORMATION.

'Twas but a narrow, city way
Filled by a busy throng,
Before I heard that sun-bright day
A Blackbird's joyous song;
Transformed was that squalid street
The while his loud notes rang—
The early dews were round my feet,
The cowslips round me sprang.

No common sounds were in my ear:
I heard the ringdove's cry,
The thrushes singing sweet and clear,
The skylark's chanson high;
The wind that fanned my brow had come
O'er daisied hills and leas,
O'er hollows pale with hawthorn foam
And wild anemones.

His amber rain the sun-god shed;
I saw the greening haze
Of opening buds on boughs o'erhead;
I saw the gorse-gold's blaze;
I saw the crimson fir-cones sway
On odorous larch and pine:
A Blackbird's song on that spring day
Made viewless glories mine.

A TRIP TO MINORCA.

WHEN in Palma, the capital of Majorca, we told of our intention to cross to the island of Minorca, they tried to dissuade us from the trip. 'There is nothing whatever to see in the island except the *talayots*,' we were informed. 'Its scenery is about as beautiful as that of Lincolnshire; and its hotel accommodation, save in Mahon, the chief town, decidedly rough.'

But a fair acquaintance with the world had taught both my friend and me to distrust the opinion held by the inhabitants of one island about the nature of an adjacent island. Such opinion is apt to be based upon prejudice, or even upon reasonable envy. No sensible person would give full credit to the judgment of an average Frenchman about Great Britain and her people; or suppose that our insular ideas of France and the French are trustworthy through and through. Besides, there were special reasons why we should feel a curiosity about Minorca. Had we not, in the Palma Museum of the Lonja, seen a great escutcheon in stone of the lion and the unicorn lolling against a wall with cobwebs about it; and had we not been told that the monument was a relic from Minorca—a reminiscence of the days of the last century when the British made themselves very much at home in the little island? Majorca is a very lovely land, full of flowers, and with a nook of mountains where the scenery is so alluring and grand that it would be hard to match anywhere. But Majorca has been Spanish ever since its conquest from the Moors in 1225. It has never, like Minorca, had the Union-jack flying gaily from its forts during the spring and autumnal equinoxials.

And so we resisted our friends' counsel, and one afternoon went aboard the steamship *City of Mahon*, bound for Port Mahon. It was a breezy April day, and the white horses were running at a great pace outside Palma's bay. Our passage was not a pleasant one. The boat had a fiendish kind of roll in the open sea. Moreover, the deck was populous with a crowd of little boys and

girls—a juvenile theatrical troupe, engaged to perform twice or thrice in Minorca before returning to Spain. They were attended by half-a-dozen older folk, including the 'prima donna,' a languishing beauty, whose pallor was soon emphatic enough to show through her painted blushes in a very sad way. And save the fat manager of the troupe, I believe in half an hour every man, woman, and child belonging to it was very sea-sick. It was about as disagreeable a scene as it could be; for Spaniards are not heroic under such a trial.

Sunrise found us, however, at anchor in the fine harbour of Mahon. The frowning forts of Spain were to our right; and on the other side of the inlet we could see the dismantled ruins of the works built up so spiritedly and with such art by our own engineers nearly a hundred and fifty years ago. A rosy sun was just peeping over the red houses of Mahon, and casting a fair welcome sheen upon the still water of the inlet, and making the rather bare hilly boundaries of the harbour look pretty enough in the translucent air.

There was every promise of a fine day, a mercy to be grateful for in the Balearics in spring, when a good deal of rain is wont to fall. Summer here is generally as dry as a bone. The hot plain country of Majorca is then, in spite of its vineyards and olive woods, a profoundly disagreeable place of sojourn. The dust and glare of the long white roads are very conducive to ophthalmia. They are bad enough in spring, but summer much intensifies the badness. Each brook bed then dries up and cracks, as if it besought the obdurate heavens to pity its agony of thirst.

The diligences of the interior are vile instruments of torture at any time. Even in the coupé, where you do get plenty of air, you are half choked by the cloud of dust in the midst of which the three or four little long-tailed horses jog along with a well-assumed air of resignation. Those who are used to the land find support in the bad cigars of Spain and the

thimblefuls of brandy which it is the fashion to drink in the different villages by the way. But to an unbroken foreigner, these are additional sources of irritation, not springs of consolation.

Late in the day we found ourselves in the diligence from Mahon to Ciudadela, with a blue sky over us, and a very endurable amount of dust in our midst, arising from our horses' feet. In Minorca, by the way, they have a wicked habit of cropping their horses' tails poodle-wise, which much detracts from the dignity of the noble animals.

We had in the meantime spent several hours among the ruins of the British forts at the head of the harbour, and reflected about Admiral Byng. It seems clear that in our day we did not seize upon the right positions for fortification. Out of question, Spain has shown wisdom in concentrating her powers upon the other side of the inlet. It is a torpedo-shaped headland, all but an island, elevated, and with precipitous red rocks as a seaward boundary. From this elevation, the Spanish engineers look down upon the remains of our Forts Marlborough, St Philip, and the suburb of George Town across the water. Their guns have a very formidable air, and the acres of red-roofed ammunition stores, barracks, and other buildings on the heights, are sufficiently impressive.

Our hopes of a closer inspection of the Mola, as this great fortified post is called, were signally defeated. Though I bore a letter to the chief officer of the place, he could not act as he would like to have acted. A Government pinnace was offered us, that we might sail round the cape. But as for getting within the walls, that was impossible. The War Minister had issued an express prohibition, and not to oblige a crowned head would my friend have run counter to it.

We rambled from one heap of rubbish to another, and marked where the French cannon-shot had harmed us most. Flowers were blooming heartily among the ruins, and bees buzzed about us. The blue sea laved the lower parts of the work, transparent for many a yard. The whole area is conspicuously devoted to slow decay. Above, on a prominent rock of the fort, are a few tombstones to British officers, but they are quite indecipherable. The salt air has eaten into the stone; and lizards scamper at headlong speed up and down their hot surfaces. And below, in the arched subterranean rooms, a myriad of names are scrawled on the plastered walls, Spanish as well as British. Of the latter, some are as modern as you please, for the Mediterranean squadron often comes to an anchor in Port Mahon and gives the jack-tars a day on shore.

Unless the Duke of Newcastle's ghost revisits the earth to afford us information, I am afraid we are unlikely to know the truth about the tragedy of Admiral Byng. He certainly failed to relieve the siege of Port Mahon, and so we lost the island. But it is by no means certain that he deserved blame for the failure. Be that as it may, he died like a gentleman.

'What satisfaction,' he asked, 'can I receive from the liberty to crawl a few years longer on the earth with the infamous load of a pardon on my back? I despise life upon such terms, and

would rather have them take it. I am conscious of no crimes, and am particularly happy in not dying the mean, despicable, ignominious wretch my enemies would have had the world believe me.'

When the news reached him of his suspension, he stripped off his uniform and threw it into the sea. This was at Gibraltar. He was executed at Spithead, on the *Monarch*, on the 14th March 1757. A cushion was set for him to kneel upon in the fore-castle of the ship—though he protested he was entitled to die on the quarter-deck—and at the dropping of his handkerchief five of the six marines who had been told off for the hateful task shot into his body. The sixth missed his aim.

'There lies the bravest and best officer of the navy,' exclaimed a common sailor, when he fell dead.

It is hard to read Byng's last words without feeling some emotion. If he was merely a State tool, to be discarded and broken when done with, then the statesmen who sacrificed him had much to answer for. In any case, none but a man of sterling worth could have expressed himself as follows at such a time: 'Would to Heaven I had died discharging my duty in the day of battle; then would my name have been transmitted, with my father's, to posterity with honour, which now will be remembered with indignation, a reproach to my relations, a disgrace to the marine, and a scandal to my country.'

When we had ridden the whole length of the island and viewed it from an eminence in the middle, we reluctantly came to the conclusion that Minorca is rather a dull and not at all a beautiful country. Save its harbour of Mahon, it has little to recommend it to the world at large. The winds are so strong over it, and the surface is so flat, that nowhere are there trees of any size. For the most part in the interior, where barley is not grown, a low scrub covers the land; though in places there are the beginnings of little artificial copses of pines which may in time get the better of their enemy, the storms.

A capital road runs through the island from north to south. General Wade started it; but since our day Spain has much improved on it, and now it would gladden even the critical soul of a bicyclist. The Minorquins meander up and down it on a very respectable species of ass, and in a mood that makes them ready to stop and gossip with any one who addresses them with a commonplace civility. There are several bright little villages in the interior. Alayor is the chief, with a big church and a sheaf of windmills conspicuous over its white-faced houses. Also, there is Mercadel; and close behind Mercadel is the famous peak called Monte Toro—or the Bull Mountain—upon which, several centuries ago, the Virgin is said to have appeared one day, in consequence of which the place was made the site of a church and monastery.

From Mercadel, which is as nearly as possible in the middle of the island, a good road trends west to the clean little village of San Cristobal. Here we picnicked agreeably with a native to whom we had been recommended, and paid respectful visits to sundry talayots of the vicinity.

Antiquaries and archæologists would delight in the talayots of Minorca. But to the common traveller they repay investigation less than one has a right to expect, seeing how their fame has been noised abroad. They are not nearly so attractive as the nuraghe, or round towers, of Sardinia, with which they may have an affinity. They are harder to discover, and as spectacles they are trivial. But there is no doubting their antiquity. Even the nuraghe must yield them the precedence for their roughness of architecture and crudity of design.

A talayot is merely an irregular round or polygonal heap of rocks, with or without a central chamber, the rock masses at the base being of course the largest. There is little attempt at masonry in them. The limestone lumps have been dug out of the adjacent soil, and piled one upon the other until the edifice is of the desired height and magnitude. They are of various dimensions, the average being about fifteen yards in diameter and about six in elevation. Where internal chambers exist, they are generally approached by a hole that is little better than a burrow, slightly below the surface of the soil. Here, too, the workmanship is much more primitive than that of the nuraghe, which are not only built of stones very fairly dressed, but which further have in some instances spiral inner staircases as well as a lofty domed chamber of considerable strength.

Who shall say, with assurance, whether the builders of the talayots and the builders of the nuraghe were contemporaries? It is not improbable, even though the latter seem to belong to a more cultivated age. Both may be the handiwork of men of Phœnician origin, or of the primitive populations whom the Carthaginians displaced. In the neighbourhood of certain of the talayots one sees clear traces of an arrangement of monoliths in the form of colonnades, porticos, and chambers open to the air. This is notably so with what is termed the Hostal group by Ciudadela, the old capital of the island, at the north-west corner of it. Some of these monoliths are recumbent, having evidently been overturned by force; but it is easy to give order to the others, in spite of the jungle of flowers, bramble, and ryegrass which envelops them. Very interesting and suggestive here is the rude highway through the brake of vegetation still indicated by the monoliths. A brace of stones, each about five feet and a half in height, stand like gate-posts in front of the entrance chamber of one of the talayots; and at the base of one of these monoliths my friend and I discovered, deep embedded, a basin of stone for all the world like a piscina, about a foot in diameter. We hit upon it by chance. What purpose it may have served, we could not of course tell.

The talayots apart, there is not much to say about Minorca. The town of Mahon is humdrum and rather pretentious. Its four-storeyed red houses seem to date from the same epoch which saw the rise of the Bloomsbury district of London. I daresay the same architects, or their pupils, had a hand in both achievements. The town deserves some praise for its hotels, in which you may live satisfactorily for about four shillings a day. This includes wine and also certain of those nice little biscuits which in Spain are known generi-

cally as 'Minorquin pastry.' No doubt, thanks to the tradition of British occupation—at least we will take leave to fancy so—cleanliness is in much esteem here.

Boots and shoes appear to be the staple manufactures in Mahon as in Majorca. The cobbler looks up from his work for a moment at the sound of a strange step on the very rough stones which pave the streets; but he has not enough curiosity in him to follow the wayfarer with his eyes for more than a moment. Another industry merits notice: this is the arrangement of shells and seaweed in fancy forms, such as ships, boxes, bouquets, and the like. It would seem a species of labour likely to be better rewarded at Ramsgate or Ilfracombe than in Mahon. There is, however, a certain demand for these pretty trifles from the British sailors when the fleet calls here.

When we had been four days in Minorca, we felt that we knew the island as well almost as the oldest inhabitant. It is but twenty-eight miles long by about ten broad, and easy of access everywhere. Word was then brought us of a steamer likely to set off for Palma on the fifth day. Without delay, we offered ourselves as passengers; and so duly the shores of the little island receded from us as the gray mountains of Majorca grew clearer. There was a lusty gale again, and a sea in which we tossed somewhat rudely. But eight hours sufficed to carry us across the strait, and enabled us to set foot once more on the much livelier strand of Palma.

The entire population of Minorca is only about thirty-five thousand, whereas Palma alone has nearly twice as many.

THE BURDEN OF ISABEL.*

By J. MACLAREN COBBAN, Author of *Master of His Fate*;
A Soldier and a Gentleman; &c.

CHAPTER XXVII.—'CONFESSION IS GOOD FOR THE SOUL.'

AFTER Isabel was established in her flat and had entertained company, she was drawn more and more into the round of social fashion. It was not 'the season,' as commonly understood, but Parliament was sitting, and the polite world was fairly full. Isabel came to be regarded as a 'success.' Certain leaders of fashion were pleased to set the seal of their approval on her; and Lady Padiham declared her 'perfectly charming,' and looked wistfully sometimes from her to her son, who, for his part, appeared quite content with the society and the conversation of his little Phemy. Isabel's fortune was not so much of a fortune as mere fortunes go—there are giddy young actresses who earn as much by twirling on their toes, and operatic songstresses who earn far more by their voices—but, added to Isabel's beauty and to Isabel's manners and attainments, it was a great deal.

Many gay young sparks fluttered round her at social gatherings, but they were speedily extinguished in her superior fire. The men who came round her and stayed were serious politicians, and eminent men of science and of letters; and it was whispered that a certain distinguished novelist was going to put her in a book; but the

* Copyright reserved in the United States of America.

only reason for the whisper seemed to be that he talked very intimately with her for a long while one evening, and was observed to watch her closely when she was conversing with others.

Ainsworth was present at some of these gatherings—he received cards of invitation, he scarcely knew why—but the court he saw paid to Isabel was not eminently encouraging to his ambition. He thought modestly of his own merits, and every time he saw her with her court of admirers, when it was difficult to have a word with her, he resolved he would not accept another invitation; yet the next invitation he received he accepted, in the hope of seeing her and speaking with her.

Sometimes he heard things said about her which, for no reason in particular, he resented. On one occasion he stood near three ladies who talked of her.

‘How do you like Miss Raynor?’ said one.

‘She is very much admired,’ said another, not venturing an opinion of her own.

‘She is very much run after,’ said the third, more boldly—‘especially by men.’

‘Yes,’ said the first; ‘she is decidedly much more of a man’s woman than of a woman’s.’

Ainsworth could not quite say to himself, and he would have found it impossible to say to another, what harm there was in being ‘a man’s woman;’ but he did not like it.

Isabel, on her own part, was not free from troublesome feelings about Ainsworth. Early in these social dissipation she had experienced a singular shock. It was at a dinner at her uncle’s, where she had got into the habit of thinking her aunt, Pheny, and herself supreme. It was somewhat of a surprise to her to find Miss Bruno, the novelist, of the company, though—remembering her aunt’s words at her own house-warming—it was no surprise to see Ainsworth set down at dinner beside her; but as dinner progressed and Ainsworth and Miss Bruno appeared to become more and more interested in each other, appeared even to begin to exchange confidences, it became a positive pain to her to know that they were together! It was the first time she had seen Ainsworth in agreeable and confidential talk with another young woman than herself! Miss Bruno was not unattractive: she was a large, pale woman, with an abundance of fluffy straw-coloured hair. Isabel found herself asking the question, ‘Does he admire her?’ when the meaning of her feeling and the pain of it rose upon her in a blinding blush. Now she knew what her feeling for Ainsworth must be—that it was no longer mere friendliness—though when it had ceased to be that she could not guess—and that she desired to have him for her own, and could not endure to think he might be another’s, or might wish to be another’s!

The vividness of that feeling passed, of course, but the recognition of it remained. She frankly considered the whole matter, reviewed her intercourse with Ainsworth from the beginning, and came to the conclusion that Ainsworth loved her! That filled her heart with joy, till she considered also and completely understood his frequent girdings at her wealth. Might he not, in his absurd belief in the difference this wealth made between them—might he not turn from her in hopelessness of winning her? She resolved

that she would show him, more clearly than she had ever yet said, that this difference of wealth was less than nothing, and vanity. With more care and intention than before, she invited him to her house when she was going to entertain other guests, and sometimes she asked him alone; for he had fallen into the habit of calling seldom except when invited.

Suddenly such tête-à-tête hospitalities were threatened with interruption—in singular fashion.

Isabel’s father had so much improved in his habits—though, unhappily, but little in his health—that he now regularly occupied himself with writing. His daughter had assured him there was no longer necessity for doing hack-work or journalism, since she had enough money to provide for him and herself both, and therefore he had turned to fulfil the dream of his life: he had begun to write the great philosophic work that was to make him famous—‘A Defence of Transcendentalism’—a work the absolute need for which was evident in an age of mere utilitarian realism. Daily, therefore, he and Alexander—who remained faithful to his chief—journeyed to the British Museum, to rummage, make notes of authorities, and write *marginalia* in the Reading Room. His daughter saw him daily depart on these expeditions without anxiety, for not since the summer had he disappeared for an opium debauch, and she had therefore postponed an expensive experiment for his complete restoration which had been in her mind since ever her wealth had come to her. He still appeared sometimes loose-nerved and shaken, but she thought that condition was but the result of his persistent habit in the past, aggravated by his present regular application to work. Seeing him thus, Isabel was arranging to take him away for a week’s rest and change in the soft air of a southern watering-place, when one morning the unexpected happened.

Alexander had come, as usual, to accompany his chief to the British Museum. He sat with his hat on his knees, answering Isabel’s talk in unusually laconic and morose tones, waiting for the chief to appear. At length he came in, in a guise that amazed his daughter. His tall thin form was clothed in a long old ulster, from each pocket of which stuck the heel of a slipper. On his head was a travelling cap, the lappets of which dangled loosely over his ears. Under his arms he carried a book or two, tied together with string; and a bundle of manuscript, including his voluminous notes for his ‘Defence of Transcendentalism,’ also tied about and about with string; and on his arm hung an extra coat. When she saw him, Isabel burst into uncontrollable laughter, though there was a feeling of anxiety and vexation at her heart. Her father winced and frowned a little on being thus greeted.

‘Father dear,’ said she, going to him and laying her hand on his arm, ‘what on earth do you mean by this?’

‘Am I,’ said he, ‘so very ridiculous?’

‘No, no, my dear,’ said she. ‘Forgive me, but I could not help laughing at your unexpected appearance with all these *impedimenta*. What is the meaning of it?’

‘I am going away, my child. Comparatively naked came I to you six months ago, and com-

paratively naked do I depart. I am going away with nothing, my dear, that your bounty has conferred on me—nothing, I mean, that is detachable from myself.’

‘Going away?’ said she. ‘But for how long?’

‘Going away altogether, my dear, to work out my own salvation.’

‘Work out your own salvation? What nonsense are you talking, father?’

‘To be explicit, my child.—I and Alexander have come to the conclusion that this gay, giddy life is not for us to lead. We must work and redeem the time. Besides, I am an anxiety and a burden to you.’

‘You and Alexander, I suppose,’ exclaimed she angrily, ‘wish to return to your old disreputable way of living!’

‘That, my child,’ said her father with a gentle sadness, ‘is an unkind thrust!’

‘It is unworthy of you, Miss Raynor,’ put in Alexander, ‘to say that!—But tell Miss Raynor the truth, sir.’

‘I beg, Alexander,’ said Mr Raynor, ‘that you will not interfere.’

Isabel was impatient and angry, but her anger was chastened and controlled by her abounding sense of the humour of the situation: while she seemed exceedingly serious and anxious, she was laughing in her heart.

‘I ought to lead, my dear,’ said her father, ‘and I wish to lead, peaceful, laborious days, uncharged with excitements: much eating and drinking, and contact with people of rank and fashion, do not agree with me. The world is too much with us here. I have a dream of peace through work, of rest through toil, and I wish to fulfil it.’

‘But, father dear,’ said Isabel, ‘can you not fulfil it here? You can be as quiet as you like. I thought you enjoyed seeing people and talking with them; and people certainly enjoy talking with you: again and again have I been complimented on having so clever a father. But if you don’t like seeing many people, my dear, then we shall see only few people—Mr Ainsworth and one or two more: and your days can be as peaceful and laborious as you will—though I think you have been making them a little too laborious lately.’

‘Let me advise you, sir,’ said Alexander, in his most portentously solemn tone, still nursing his hat on his knee, ‘to tell Miss Raynor the whole truth.’

‘Let me suggest, Alexander,’ said his chief, ‘that you should take a short walk and return in a quarter of an hour. By that time, I daresay, my interview with my daughter will be at an end.’

‘Very well,’ said Alexander, rising; ‘I will return in a quarter of an hour.’

‘My dear,’ said Mr Raynor, as soon as Alexander was gone, ‘I am a miserable sinner. I have never told you anything but truth, my child; I think I am incapable of *speaking* anything but the truth; but, my dear, I have been acting a lie!’ He set his *impedimenta* on the table and sat down, dropping his chin in dejection on his breast. ‘You have believed—I have induced you by my conduct to believe—that I have given up the use of that detestable drug: I have not, my dear. I have not used it openly in the

form of opium since the summer, but secretly I have taken it since ever you took me to the Isle of Man, in the form of laudanum. I began it there—I could not live without the detested stuff—and I have not since intermitted more than a day or two without a dose of it.’

‘Oh, my poor father!’ said she, kneeling by him and taking his hand. ‘What a bond-slave to a deadly habit you have made yourself!’

‘Bond-slave indeed, my dear!’ he assented. ‘Bound with bonds more intangible than gossamer, but more enduring than thongs or chains!’ And he showed, even in that moment, an evident relish of his phrases.

‘And what were you intending to do, my poor dear?’ said his daughter, with tears in her eyes. ‘Where were you intending to go?’

‘Alexander was going to find a lodging,’ said he, turning on her helplessly his large appealing eyes; ‘and I was going away to work till my book was done, and then to lie down and die! My continued existence is a burden and a shame to the earth! And yet I once had great schemes!’ he added with a wondering pathos.

‘But, dear father,’ said Isabel, caressing his hand, ‘how could you work in a poverty-stricken lodging, after having had comfort and plenty, alone, after you have been used to cheerful society, and with that habit growing tighter about you? You do not understand yourself, my dear. You have confessed to me, and now we will take counsel together what must be done. Why did you not tell me before, dear? Have I been unkind to you? Have I been neglecting you? No, no. I hope I have not.’

‘No, no, my child!’ said he, while tears sprang in his eyes and flowed weakly down his cheeks. ‘No! If anything could save me, your love would, my child! It embraces and compasses me all about!’

‘Well, dear,’ said she soothingly, ‘we must now think of something to be done to deliver you from this.’

‘“O wretched man that I am!”’ he murmured, shaking his head. ‘“Who will deliver me?” This new form of the habit is worse than the other! It is always with me! I sometimes sit in horror—deadly horror!—of the degradation and the blighted utility of my life!’

‘But to think such things,’ said his daughter, ‘is only morbid! Hopelessness of that kind is paralyzing! And in any case you must not think of leaving me alone! I am determined, my dear, to see you yet free and strong! And to gain that end I will spend all I have, if it is necessary! Don’t you think, father, it would be wise to take the advice of a clever doctor?’

‘Oh, not a doctor, my child!’ exclaimed her father in something like terror.

‘Well, shall we talk the matter over with Mr Ainsworth? You would not like to take Uncle George into counsel. He is good and kind; but he does not understand your case.’

‘Yes,’ said he, with something like cheerfulness, ‘let us talk it over with Ainsworth.’

So, when Alexander returned, he was despatched with a note to Ainsworth, at the office of his newspaper, requesting him to call as soon as he could. He sent back word that he would

not be free till two o'clock, but that he would set out then.

Ainsworth came to his time, and the case was set forth to him. What did he think should be done? What would he advise?

'Most people,' said he, 'have opinions ready about the treatment of everything, from a pimple to an earthquake. I, too, have opinions, but I think that in this case they are worth nothing. I would suggest that the proper thing to do first is to see a competent doctor.'

'In fact,' said Isabel, 'you are like the man in Charles Lamb's story: you advise that we should take some advice.'

Isabel spoke lightly, on purpose to reassure her father and make him feel more at ease.

'Quite so,' said Ainsworth. 'Dr Sandringham is said to be a very good man. He is to be seen, I believe, up to four o'clock. There is no time for action like the present: suppose we go at once?'

Mr Raynor, having Isabel's opinion corroborated by Ainsworth's, agreed to see a doctor; and a cab was called, and he was being driven—in the company of his daughter and Ainsworth—to Dr Sandringham's, before he had time to turn round. Isabel and her father entered the doctor's consulting-room together, while Ainsworth remained in the waiting-room. Then Isabel came out and waited also, while the doctor interviewed Mr Raynor for half an hour alone. At the end of that time he emerged radiant with hope: such virtue is there in the word of one with authority.

'He says I'll get over it,' he exclaimed, straightening himself. 'And he wants to speak to you, my dear.'

Isabel entered the presence of the doctor again, filled with curiosity and hope.

'Your father's is a most interesting case, Miss Raynor,' said he. 'I am all the more hopeful of it because he is a man of quick imagination. I think we can cure him of his habit; but—the cure, I tell you frankly, will be rather expensive—a matter of six or seven hundred pounds a year. Is that beyond you?'

'Oh no,' said Isabel. 'I will gladly pay whatever is necessary. What must be done?'

'There is a doctor who takes two or three patients in his house on the Surrey hills: I recommend him to go there.'

'Go away from under my care?' exclaimed Isabel.

'It is much better that he should be from under your care, my dear young lady. He will be taken complete and thoughtful care of by a scientific man who will understand him. You need be under no apprehension, I assure you, that he will not be taken care of.'

'Does he approve of going away himself?'

'Quite,' answered the doctor promptly.

'Then,' answered Isabel, 'I have no more to say. When should he go?'

'As soon as it can be arranged. I will telegraph to Dr Skelton to be here to-morrow. I will tell him all I think of it, and then he will come on to you. I am glad to hear that your father is engaged on a philosophic work: he will be best employed. And, permit me to suggest—keep from him all particulars of outlay of money: I can see it would prey on him very much if he thought he were a great expense.'

So the three drove back to Isabel's abode, discussing cheerfully her father's going. He was enamoured of his prospect.

'Though,' said he, 'I shall miss the Museum. What shall I do for books for my work?'

'We will get you a subscription at the London Library,' said Ainsworth; 'and I—or Miss Raynor—will bring you a bundle of books once a week, or when you will.'

'That will do very well,' said Isabel.

'But what,' said Mr Raynor, 'is to become of Alexander? My poor Alexander!—he is a faithful creature! He has been with me for years!—a true friend!'

'I will look after him, father,' said Isabel, 'as much as he will let me.'

'And what services of his Miss Raynor does not need,' said Ainsworth, 'I will secure. He shall be my Patroclus, my *fidus Achates*, as he has been yours, Mr Raynor.'

Thus they talked on the way; and Ainsworth, though he felt he ought to have been at work earning gold to bring his 'queen of gold' nearer to him, abandoned himself to the delight of this brief, bright interval, which reminded him of the Marylebone days when they had all been gay and easy friends together.

And thus it came about that Mr Raynor went away to be cured, and that tête-à-tête meetings between Isabel and Ainsworth ceased for a time.

HOW TO TAKE OUT A PATENT.

BY AN OLD PATENTEE.

To take out a Patent for the invention of a machine or some mechanical combination, or for the discovery of some new chemical or manufacturing process, was a serious business long ago. But we have changed all that of late years, thanks to those who advocated for so long and so persistently a 'Reform of the Patent Laws'; and also to the influence of the Great Exhibition of 1851. The result was the passing of the Patent Amendment Act of 1852, and of a subsequent Act in 1883. Later legislation on the subject is contained in the Patent Act, 1888, and the Patent Rules, 1890.

Estimated roughly, the cost of taking out a patent now, securing the invention for the first four years, is nearly represented by pence, but under the old Act it was represented by pounds. To such readers as have an inventive faculty and who would like to take out their own patents, I venture to think that I may be of some service, and this in the way of giving hints directly and practically useful, which will enable them to get their inventions secured by letters-patent at a very moderate cost.

The real difficulty with which you, my inventive reader, will have to contend lies in the direction of your own work—namely, the preparation of your drawings, the drawing up of your specifications, and the making of your 'claims.' Having matured your invention, so far as you can at the early stages of its existence, the first step you should take is to ascertain

whether your invention is 'new.' This, if done at all, should be done before you proceed to make 'Application for Provisional Protection.' But as going back through the Patent Office Records of years to find and glance over all specifications of patents for inventions bearing on the subject of yours takes much time, and as time is money, you may, as many do—the 'fees' being now so small—dispense with the 'search' altogether. You run this risk, however, that some morning after having applied for Provisional Protection, or at a later stage for completion of your patent, you may receive an official document informing you that some one has given 'notice of *opposition* to (your) grant for provisional protection,' or to your 'patent,' as the case may be. Should you in this case elect 'not to fight,' but rather to drop the patent, the loss in fees paid, say even for protection for the first four years, is not very great. But remember that there are patents worth fighting for; I myself have at least one over which I should be inclined to be somewhat pugnacious. But if you fight, take my advice. Do not fight unaided; secure the services of a first-class patent agent. Patent business is now of such enormous extent that every town of importance has at least one first-class patent agent.

But if, to be as safe as you can make yourself, you decide to make the 'search,' that is now, as compared with the old and costly system, a comparatively easy task, since the complete specifications of all the patents which are taken out each year are *printed*, and complete sets of these are kept in certain places of easy access to the public. The public offices in which complete sets can be examined are as follows: In London, the Patent Office Library in 25 Southampton Buildings, Chancery Lane; and at the Department of Science and Art, South Kensington. In Edinburgh, at the Museum of Science and Art. In Dublin, in the Public Record Office.

Assuming that you elect to go on with your patent without making a 'search,' your first work is the preparation of the 'specification'—as it is officially termed—or description of the invention. The worth of the invention lies in truth in this document. A doubtful phrase in it, the employment of a wrong term, the omission of one sentence, the giving of another, may wreck the patent, may give a loophole to the sharp, perhaps over-sharp and unscrupulous, some of whom are always on the look-out for an opportunity to set the patentee at defiance, or subject him to vexatious and costly litigation in defending his rights. And of this document the most important part is that in which all the 'claims' are stated.

Then, again, with regard to the drawings—here assuming that your invention is a mechanical one—you must be careful in preparing them for 'sending in to the Patent Office,' that they clearly and explicitly set forth the character of the machine, or the nature of the particular mechanical combination claimed. 'Pretty' or 'nice-looking' drawings, such as youthful draughtsmen are usually ambitious to produce, are not required. Indeed, the style in which the officials require them to be executed precludes this fineness of drawing. What is wanted is

absolute clearness in showing what it is which you claim as your invention.

The specifications required under the Patent Office régime are of two kinds or classes—first, the 'Provisional,' and second, the 'Complete.' Of these the provisional, as its name partly imports, has for its object the securing to the inventor the 'right' to a patent if accepted officially and not opposed. This 'right' prevents another from taking undue advantage of the inventor, or his being forestalled by some one who may be thinking of something of the same sort, and of protecting it by patent. But the official acceptance of the provisional specification, or the granting of what is officially termed 'provisional protection,' brings with it three other and important advantages. In the first place it gives you nine months, during which period you may be making inquiries as to the probable chances of your invention meeting with commercial success. The second, and possibly the greatest advantage to many inventors is this. The inventor may not have the means to do justice to his patent if it be finally accepted. Or it may be that the bringing out and manufacturing expenses may amount to such a sum that he will be compelled to get the help of a capitalist. Now, his provisional protection secures him from the risks which a patentee ran under the old patent laws arising from those to whom he showed his invention in confidence. The third advantage which accrues to the inventor from the provisional protection which he obtains is that the period of nine months which it gives him can be employed in maturing and perfecting his invention. Those nine months of grace begin from the *date of the application* for provisional protection which the inventor sends in, *not* from the date of its official acceptance. Practically, the nine months is reduced to about seven.

The second class of specification recognised under Patent Office régime is that known as the 'Complete.' A provisional specification differs from a complete in those two points: in the first place, all that is demanded from it is such a fairly complete description of what the invention actually is, that there will be no doubt as to what the inventor desires to secure by patent. The full details, making clear the method in which the invention is to be carried out, are not required. All these are reserved for the Complete Specification, in which they *must* be given. The second characteristic of a provisional as compared with a complete specification is that it is not imperative that the inventor should state what are the 'claims' which he makes. These, again, are reserved for the complete specification, in which also they *must* appear.

Although the two kinds of specification now described differ in most important points, it is not essentially necessary that both should be sent into the Patent Office. The provisional specification may be altogether dispensed with, and the complete one sent in at the first. Each specification—provisional and complete—*must* be sent in 'in duplicate'—that is, two copies of specifications, and two sets of drawings, are now required, in place of four under the other method, in which you take out both 'provisional' and 'complete' specifications.

Assuming that you have got your scheme so

far matured that you are prepared to apply for a provisional specification, you will now be ready to prepare the finished official form to be forwarded to the Patent Office. The paper, of the size known as foolscap, must be strong and of good quality, and be wide ruled, with a margin of two inches on the left-hand side of the page. The style of handwriting best liked by the officials is clear, round, and large, so as to be distinctly read off at once. In paging your office copy, the first page must *not* be '1,' but '2,' and this inasmuch as the stamped and printed form presently to be described forms in the official arrangement 'page 1.' All the sheets of the specification are to be secured or fastened consecutively together at the left-hand upper corner. The provisional specification concludes thus: 'As witness my hand this _____ day of _____ One Thousand Eight Hundred and Ninety ____.' Finally, you sign with your full name.

Having thus got ready your provisional specification for sending in to the Patent Office, you must now address yourself to getting your drawings prepared. There are two sizes of sheets allowed by the Patent Office. The first size, which is that preferred, is thirteen inches by eight. The second size of sheet is thirteen by sixteen inches. There must be a margin of half an inch in width set off on the sides and ends. The quality of the drawing-paper you employ must be good—strong, pure white in colour, and hot-pressed or calendered so as to present a smooth surface. There is no limit placed to the number of the sheets of drawings you may send in along with your specification. The sheets are tagged at the corner along with, and *after*, the specification. Colour or India-ink washes should only be used when absolutely necessary, drawings in pure outline being preferred by the office. When 'hatching' or cross-lines are employed to indicate parts of the subjects which are shown in section, the lines must be 'drawn in' pretty widely apart. 'Shade-lines'—that is, broad and dark lines to indicate parts in projection or for effect—should only be used when absolutely necessary. Letters of reference must not be of less height than one-eighth of an inch; and when the part indicated is small and would be rendered obscure by so large a sized letter being superimposed upon it, the reference letter must be placed outside the drawing on the free space of paper, with a dotted line, if necessary, to the part to which the letter of reference applies. The lines of the drawings and all the reference letters must be made permanent in Indian or China ink, of a deep, absolutely black colour. The sheets should also be numbered consecutively, and the various figures marked Fig. 1, Fig. 2, &c. The scale of the drawings must be large enough to make all the points or details of your invention clearly understood beyond any doubt. It is absolutely essential that the 'scale' be drawn, not merely indicated in words.

Having thus all your documents ready to hand, you are now prepared to make application in the official form. The first step in this will be for you to obtain the stamped form marked 'A,' and the Form 'B,' which is unstamped, and is otherwise a duplicate of Form 'A.' The cost of Form

'A' is one pound sterling (Form 'B' not being charged). It may be obtained through any money order post-office in the kingdom within three or four days from the date of application. Some of the General Post-offices in large towns generally keep all the patent forms in stock. Forms may also be obtained through the medium of Inland Revenue offices. Having obtained your two forms, you proceed to fill up their blank spaces. The filling up of the forms is completed when you adhibit your signature, and the day of the month and the year on which you signed the document.

If the space in the *printed* form for the 'general description' is too small to take in its matter, condensed to the full as you will try to make it, you must *not* 'continue' it by going 'over' and writing on the back of the form. But you must take one of your specification paper sheets—with its margin—and continue and conclude your general description on it, if the length of its matter will permit of its conclusion. If it does not, you must take another and second sheet. The printed 'form' is considered officially to be 'Page 1,' so that if you can get in your 'general description' into its blank space, the first page of your written provisional specification will commence with the number or figure '2.' If you have two extra sheets or pages, it will then be '3.' The documents should be accompanied with a courteous note, addressed—as also the packet—to 'The Comptroller-general, Patent Office, 25 Southampton Buildings, Chancery Lane, London.' And here, in justice to a class of whose members harsh things are sometimes spoken, I venture to say, speaking from experience, that the Patent officials are both courteous and considerate.

In due course you will receive a printed form acknowledging receipt of your documents; and probably, within six or eight weeks after the date of your application, you will receive a notification of the acceptance or refusal of your application. You will now, as already stated, have nine months—less the time taken in getting your provisional acceptance—to mature your invention, also to make such inquiries as will enable you to decide whether you should go on with it or not.

Assuming that your invention is too good a one to be thrown up, you will, of course, in ample time begin to prepare your 'Complete Specification' for filing at the Patent Office. Bear carefully in mind the date at which you ought to lodge your complete specification. A *single hour after the date* will make your patent void. It is right, however, to state that official provision is made for your being placed under such circumstances as will prevent you from lodging your complete specification before the appointed or legal date. Such, for example, as your having instituted some trials or experiments which you should like to see the result of, so that you might embody in your documents some improvements which would greatly enhance the value of your patent. By the payment of certain fees, running from two to six pounds, you can obtain 'extension of time' in which to file your final document—an extension varying from one to three months. But be careful to note this—that your application for this extension must

JOHN UPCRAFT'S CRIME.

itself be made in time. A detailed statement of your 'claims' forms the last paragraph of the complete specification. They are preceded by the following introductory paragraph: 'Having now particularly described and ascertained the nature of my said invention, and in what manner the same is to be performed, and declare that what I claim is:'

Then follows the statement of claims. Each claim is numbered, as (1), (2), &c., and each forms a distinct and complete paragraph. Although the validity of your patent is dependent on the complete specification taken as a whole, nevertheless much rests also upon the 'claims' you make. I ought, indeed, the rather to say 'very much;' for it is the claims which differentiate your invention from that of others proposing to do the same work, or having the same purpose in view. At the same time, the utmost care should be taken not to include claims which might or would go beyond what you conceive or believe to be actually new.

Arrived at this stage of your application for protection by patent for your invention, you are now ready to purchase the next form required to complete it. This is known in the official list as 'Form C,' the stamp on which is of the value of three pounds sterling. By paying this amount to the Postmaster at the nearest Money Order Office, the form will be received in a few days after the payment has been made. It is accompanied by a duplicate form unstamped, and for which no charge is made.

Form C has then to be filled up precisely in the same way as the provisional specification. But the number of the patent, and the date of its application given in the acceptance document, must be referred to in the complete specification. The form and the pages of what may be called the text of the specification, and the drawing or drawings, if any, are then to be sewed together, making two sets, one set carrying the stamped Form C, the other the duplicate form, unstamped. Then, as in the case of the provisional specification, carefully make up the packet and despatch it.

Let me hope that your acceptance will be followed some fine morning by an official envelope containing your 'Patent Grant,' officially signed and sealed, with a printed note informing you that it is now forwarded, and directing your attention to the way in which, and the dates at which the succeeding payments are to be made in order to prevent your patent from lapsing and 'becoming void.'

The full period over which your patent gives you protection for your invention is fourteen years, commencing on the date of your application for provisional protection. The cost of protection for the first four years is covered by the two forms 'A' and 'C,' amounting together to four pounds. Before the expiry of the fourth year from date of application you must pay the first renewal fee of five pounds. Before the expiration of the fifth year, and in respect to the sixth year, you will have to pay six pounds. The succeeding payments, before the expiration of the sixth up to and inclusive of the fourteenth year, are eight, nine, ten, eleven, twelve, thirteen, and fourteen pounds. Thus, beginning with four pounds for the first four years, each year's payment rises one pound in value. The total amount paid for the fourteen

years is ninety-nine pounds, and embraces the three kingdoms and the Isle of Man, but not the Channel Islands, or any of the British possessions or colonies.

JOHN UPCRAFT'S CRIME

A MARSHLAND ROMANCE.

By THOMAS ST E. HAKE.

IN FIVE CHAPTERS.

CHAPTER I.—THE MISTY NIGHT.

THE boom of a signal-gun shivered across the marshlands in the lower reaches of the Thames. It was a damp, wintry afternoon; and over these fenny levels, that extend for miles along the river-banks and far inland, with their narrow dikes, stunted pollards, and blear-eyed cattle dotted here and there, a white mist was rising. It had already risen above the dikes, it had settled round the pollards up to their stumpy heads, and the cattle were grazing below it, or else ruminating, apparently accustomed to their misty surroundings.

On a slope behind these marshlands there is many a straggling village. One of these is known as Little Thurrock. It straggles back from the swamps, as if it had picked its way out of them, and stopt at the foot of the old chalk hills. The clock in the square tower of Little Thurrock Church—a tower that looks almost as old as the hills behind it—was striking four. Its chimes had hardly died away when the joyous shouts of the village school children filled the air. Out they flocked with hurrying footsteps from the school-house adjoining. The school-door had been flung open like a safety-valve for steam at high pressure, and the sound of children's voices had come bursting forth.

At a raised desk within the school-room sat a girl of eighteen. She leaned her elbows upon the desk and stared abstractedly before her. On a bench below the desk was a curly-headed boy, who watched the girl's face intently.

'They're firing agin!' he presently ventured to suggest. 'It's from the hulks; ain't it?'

The school-mistress looked severe—if a frown on so sweet a face could be called severe—and answered: 'Mind you don't go there, Jim, when you grow up. It seems to me that you are going that way.'

The boy hung his head. But he soon looked up again to find the girl more abstracted than ever. 'May I go now?'

The girl looked at him with a flash of her dark eyes: 'What!—to the hulks?'

'No,' said Jim. 'May I go home, I mean?'

'You will never'—and the girl could scarcely suppress a smile—'never play at convicts in school-hours again?'

The boy shook his head with energy.

'Then you may go. But'—

'Good-night, miss!'

A skip and a jump, and Jim had reached the door. In another minute his voice was mingling with the other voices that were now growing less audible in the lanes and bypaths, as the children scattered into their various homeward ways.

For a moment there was a thoughtful look on the girl's face; but her eyes brightened as she locked up her books and papers; and when she had put on her bonnet and cloak, she hurried out with hardly less eagerness than her noisy pupils. She did not shout or dance along, however, as they had done, though she felt a strong impulse to whirl round and round on tiptoe into the mist. The night was closing in; a light wind was creeping up from the river, and driving the mist before it in shadowy, fantastic shapes. A curlew passed high over the girl's head in swift flight, delivering its plaintive cry.

The girl began to sing blithely, and now seemed almost to be dancing as she tripped quickly on her way. She gave no apparent heed to the repeated sound of the gun that came to her ear over the darkening marshes; it was a sound to which she had been accustomed since childhood. It did not interrupt her singing or cause her to walk along less buoyantly. Indeed, she moved so nimbly that she hardly appeared to touch the ground. She was tall and shapely, and with her long gray cloak wrapped about her, she appeared as though fading, as the light faded overhead, into a lively spirit of the mist. She soon left the village behind her, and descending obliquely towards the marshlands, presently came in sight of a cottage standing alone at the road-side. A light had appeared at one of the windows, and at the sight of it she hastened her steps still more. A low stone wall surrounded the garden. The girl passed in at a gateway, and turning down a side-path, reached a back door. She raised the latch and went in. She found herself in a neatly furnished kitchen. A middle-aged, rosy-faced woman, with a peevish look, was busying herself over the tea-tray.

'Father is in?'

'He is, miss. But he ain't in the best o' tempers,' was the answer, 'I can tell you.'

Without further questioning, the girl passed through the kitchen into a snug little parlour. An elderly man sat in a comfortable armchair before the fire; a shaded lamp stood on a table at his elbow. The light fell upon a handsome, delicate face; but there was little that could be called cheery in the expression; and the gray hair and dark bushy eyebrows only added to the look of sternness. There was no deep sympathy in the cold gray eyes. The man, indeed, scarcely looked up when the girl came in; and even when she kissed him playfully on both cheeks, he kept his eyes bent upon the fire. And yet he seemed to be watching her in a stealthy way all the while from under those convenient eyebrows.

'No letter for me, father?' The girl asked the question in an unsteady voice. She waited with parted lips and wide-open eyes for a reply. He looked up now, but not at her. He looked sternly at the woman who happened at this moment to come bustling in with the tray.

'Do you hear, Mrs Gilkes? You brought me the letters this morning. Any for Miss Jessie?'

The severe tone in which he questioned her appeared to flurry Mrs Gilkes, for she answered in a stammering manner: 'Letters? I gave them all to you, sir, without so much as glancing

at 'em. Any for Miss Jessie? Why, no—not that I knows of, Mr Bryce.'

'You know there were none,' said Mr Bryce. 'Don't I always send you up to the school with them, when there are any, the moment I can spare you?'

'You do, sir.' Then answering Jessie's appealing look, Mrs Gilkes went on: 'But what with one thing, as you know, and what with another'—

'You can go, Mrs Gilkes,' interposed Mr Bryce.—'You don't want her any longer; do you, Jess?'

Jess followed the woman out into the kitchen. She looked deeply troubled; but she brushed a tear from her flushed cheek, and said, laughingly: 'Jim has been naughty again, Mrs Gilkes. His mind is always running on convicts; I'm afraid he's quite incorrigible.'

Mrs Gilkes, who was Jim's mother, looked as shame-faced, upon hearing this unsatisfactory report, as though she were a convict herself. She put on her bonnet and shawl in her flurried manner, and answered, half-apologetically: 'He always is a bit queer, my Jim is, when they're a-firing for convicts. I'm given summat that way myself. They was a-firing the night afore my Jim was born; so it's in his nature like, you'll understand?'

When Jess had bolted the door behind Mrs Gilkes, her face instantly changed. The brightness went out of her laughing eyes. She seemed like one who could no longer keep back the disappointment and consequent grief that had overtaken her. 'No letter from him yet? What can it mean?' She stood with her hands clasped, looking blankly before her. She looked the picture of despondency, with ripe, red quivering lips, and a bright tear rolling down each cheek.

'Jess!' It was her father. She made an effort to recover her cheerful look; she knew that he hated the sight of tears. He expected every one about him to be bright and chatty; and he seldom had reason to complain of Jess. But to-night—as she found it impossible to hide from him—she felt in no amiable frame of mind. Something weighed heavily upon her spirits—something that seemed more than a mere presentiment, something that she could not put aside.

'When you've done gossiping,' said he, as she entered the room, 'perhaps you'll make the tea.'

She set to work in silence. Her father watched her movements in his cunning way. He did not appear perplexed at finding her so uncommunicative, though it was by no means a usual mood with her. He appeared more anxious than perplexed about Jess to-night.

'Well,' said he, when she had handed him his cup and had fallen back into a state of abstraction, 'you are not very entertaining.'

The girl looked up suddenly at her father with searching eyes. 'I am trying to think,' said she, 'why John does not write.'

Her father made no answer. But he frowned, and fidgeted in his chair, and plainly showed that there was little entertainment, in his opinion, to be got out of that subject. He even made more than one effort to rise from his chair, as if with the thought of pacing up and down the room;

but he was too indolent, as well as too gouty and rheumatic, to get upon his feet without considerable provocation.

'Father!' cried the girl, with a restless look in her eyes, 'I must know the meaning of John's silence; I can bear it no longer!'

Mr Bryce's face became troubled. But it was evident that John's silence was not the cause; it was Jessie's impulsive and determined manner.

'Patience, Jess,' said he, in a conciliatory tone—'patience!'

'Patience?' said the girl, jumping up from her chair. 'I have shown too much patience! I have followed your advice. I have waited—waited! I ought to have followed my own instinct long ago. I hope it is not yet too late.'

'What do you mean?'

'I mean,' said the girl, 'that when no answer came to my appeal—not one word of reply to all my letters—I should have gone straight to London. But you dissuaded me. I should have gone and learned what his silence meant; for I will not believe that he is changed towards me, unless he tells me so. A letter from him would not convince me; nothing would now, except his own outspoken confession.'

Mr Bryce began to exhibit so much uneasiness, his eyes wandering from one object in the room to another, that Jessie must have noticed it, if she had been less self-absorbed.

'To-morrow,' said Jess, 'I shall go to town.—It's no use trying to dissuade me now,' she hastened to add, noticing a sudden movement on her father's part, as though he were about to interrupt her. 'It's Saturday; there will be no school. And if you refuse to give me the money for the journey, father, I shall walk!'

Her father looked at her straight for the first time. She returned his glance, and was surprised to see no sign of anger, or even opposition. She saw something worse—she saw a look of actual dread.

'Jess,' said he, making a great effort to steady his voice, 'you can go to London if you like. I don't grudge you the money. But you will do no good, my girl, by going there.'

Jess was dumfounded. Her father's answer was so unexpected; his changed attitude bewildered her. Suddenly she broke out in her impulsive way: 'Something has happened!' She looked about her distractedly, as if for some explanation. 'Something has happened!' she repeated. 'You knew it. You have kept it from me!' Jessie spoke in a tone of bitter reproach. A burst of anger would have touched her father less keenly.

He broke out in a weak, pleading voice. 'It was done for the best—all for the best,' said he. 'Jessie! you shall know everything, my dear—everything.'

She pressed her hands before her eyes. 'He cannot be dead?' She asked the question as though slowly realising that something even worse must have come to pass.

'Sit down,' her father insisted. 'I will tell you in a few words what has really occurred.'

She obeyed; and leaning her elbows on the table, with her head between her restless hands, she waited eagerly for him to speak.

'John Upcraft got into difficulties,' Mr Bryce began—'weeks ago. It led to legal proceedings.

There was a trial—it lasted for some days—and, in a word, he was found guilty.'

Jess rubbed her eyes. 'Guilty?' and she looked about her, as if doubting whether she was awake. 'Guilty of what?'

'Why, you see,' said Mr Bryce, trying to get delicately over the avowal, 'the case was a serious one—very serious. It had to be dealt with in the criminal courts. For the accusation brought against Upcraft was one of forgery. In fact—Shall I go on?'

'No!' There was determination in Jessie's tone. What more was there to hear? A look of horror settled upon her face. Her father bent his head and wisely remained silent.

'He wrote to me—didn't he?' Jess presently asked in a choking voice. 'He must have written!—Where are his letters?'

Still silent—never even glancing towards her—Mr Bryce rose slowly from his armchair and went to his desk under the window. He unlocked a drawer and brought out a packet of letters.

Jess took them eagerly in both her hands. But the sight of John Upcraft's familiar handwriting was more than she could bear to look upon unmoved. The letters were unopened—had remained unanswered for weeks! What would he think of her? The self-questioning brought a flood of tears.

'These newspapers,' said her father, taking a bundle from the same drawer, 'contain an account of the whole case. When you have read them, Jessie, you will have learned all.' While still speaking, he hobbled to his armchair and sank down.

The girl was on the point of leaving him. She stopped, with her hand upon the door, and looked back. There was suppressed anger in her tone, but her eyes flashed at him with passion as she asked: 'Why did you keep all this from me?'

Mr Bryce looked nervously into his daughter's face. 'Shall I be candid? Well, then! I did not feel sure of you, Jess, you are so impulsive. I dreaded—and the dread kept me awake many a night—that if you knew of this business, you would throw up your situation at Thurrock School. And that, I knew,' he added, 'would mean ruin—starvation. For am I not poor and afflicted?'

By profession, Mr Bryce was a surgeon; but his ailments—so he told every one—had forced him to retire from practice. He had given Jess a good education, however, before retiring: he had even had her trained for a nurse at the county hospital. He was poor, as he had avowed—wretchedly poor. But Jessie's earnings at the village school, and his own slight savings, just enabled them to meet the expenses of their modest home.

For a moment, after her father had ceased speaking, Jess stood looking at him more in pity than anger. His want of heart—his unsympathetic, selfish nature, was well known to her. But she had thought to receive some words of commiseration. It was inconceivable to her. He appeared indifferent, so long as his comforts were secure. What this calamity meant for her seemed to give him no concern. She sat down over the kitchen fire to read the letters. She felt eager to break the seals; and yet the dread

that they would confirm what her father had so reluctantly told her, made her hesitate. She could no more believe John Upercraft guilty than believe that his love for her had changed.

In the midst of these thoughts the noise of the signal-gun smote faintly upon her ear. To-night, she felt a strange fascination for the sound. The wretched convicts down in the prison-ships, on the banks of the marshlands, had a new interest for her. There was one of these men, there could be little question, out in the foggy marshlands now. She had seen one of them once; it was a year or two ago; and the whole scene recurred to her. The man had been hunted down by a company of soldiers, and retaken. They had passed the cottage on their way to the river: Jess had seen the convict's face by the light of flaring torches as they went by; and never had she forgotten the man's look, though it had only flashed upon her for one moment.

And this was now John Upercraft's fate. He was lying in some damp prison-ship, perhaps, while she sat thinking—thinking beside this warm fire!

At this moment there came a continuous knocking at the kitchen door.

THE IMPORTED LIVE-MEAT TRADE.

IN the early days of 1874, a small quantity of beef, mutton, and poultry was shipped from Canada to England. The consignment was but an insignificant one, containing as it did some twelve tons in all; but viewed in the light of later developments, the shipment was most important, for it ushered in a trade that now provides us with one of the most necessary elements of our imported food-supply. This beef, the pioneer of vast cargoes that were to follow, found ready sale at from sixpence to sevenpence per pound, and left a handsome margin of profit when the initial cost of threepence per pound, freight, and other expenses were paid.

The news of the success attaching to this venture soon became noised abroad, and, from dead-meat to live being a perfectly easy and natural transition to the commercial mind, the September of 1874 saw the arrival of 273 live cattle from Canada, a total which was increased to 455 before the close of the season. Prior to this date, the only foreign market for Canadian cattle was the United States, which levied an *ad-valorem* duty of twenty per cent. on every beast imported. The British market, however, was the better one, and as the freight across the Atlantic was about equal to the tax which had to be paid on admission to the States, it is small wonder that the most sanguine expectations were formed as to the possibilities of the trade.

The first consignment of Canadian cattle brought on an average thirty-two pounds per head, and the cost of conveyance to England amounted to six pounds per head—a sum that has now fallen to about one-third or one-fourth of that amount. Canada was not allowed, however, to reap the

whole benefit of this lucrative business. The States began to send cattle also. But at first much opposition was experienced. The English producers cried out most bitterly against what they considered an invasion of their vested interests. The roast beef of Old England was in danger, and, strange to say, the public sentiment was for a time aroused against the trade. The incalculable benefits which a supply of good beef conferred—for experiment proved it to be of the best quality—soon overcame the prejudice, and the British consumer consoled himself with the thought that if his beef was not exactly a home-grown product, it was at least killed and dressed on English ground.

The most serious objection made to the trade, however, was the danger of contagion to English stock; and to guard against this, the Contagious Diseases (Animals) Act was passed in 1877. By this law, all cattle coming from a country where disease is known to be, must be slaughtered at the port of landing within ten days after they are disembarked. This produced some important modifications in the trade, for in those days refrigeration was a science that was in its earliest infancy, and dead meat could only be carried in the winter season. The passing of the Act therefore necessitated that all cattle sent from an infected area should be fat and ready for the market. Milch and store beasts would thus be comparatively valueless unless they were fattened on the other side of the Atlantic. The United States were soon scheduled as infected; but Canada remained free, and her cattle could be sent inland to fairs and markets. In 1883, trade jealousies made a desperate attempt to prove that Canada contained disease. The allegation, however, was denied, and the most searching examinations failed to prove that the live importations from Canada were other than sound in wind and limb. On the 21st November last, Canada was also scheduled, one single case sufficing to bring this about; and until the restriction is removed, her cattle are subject to the same rigorous rules as apply to those imported from the States.

Liverpool's share in the vast traffic that supplies the British consumer with much of his beef far exceeds that of any other port, and the provisions which her Docks and Harbour Board have made for the requirements of the business are on the most complete scale. In fact, the Mersey cattle-trade is second to none in the world; and it may give some idea of its magnitude to remark that at the more important of its two 'lairages,' the highest record of animals slaughtered on a single day is in excess of eighteen hundred.

There are several vessels among Liverpool's cattle-fleet that carry with perfect comfort and safety a thousand head of cattle, and the average loss per cent. all the year round is but one-half, or, in other words, one beast out of every two hundred dies on shipboard. Cattle-carrying has now attained the dignity of a science; and one has but to observe the condition of the bovine passengers as they are landed to see how healthy is the treatment which they must have received during their voyage.

On arrival in the Mersey, the cattle-laden steamer proceeds, we will suppose, to the Woodside Cattle-stage, which is on the Cheshire side of the river, immediately opposite to Liverpool. Here the cattle are landed amid the persuasions, vocal and otherwise, of the cattle-men, or 'bull-pushers,' as the vernacular of the trade denominates those who have had charge of them during the voyage. From the stage they proceed direct into the lairage, where there is stall accommodation—and this is only one of two lairages devoted to the American live-meat trade—for 3500 head. Very comfortable, indeed, are the quarters in which the cattle now find themselves. Their inviting coolness, the all-pervading sense of cleanliness, combined with the suggestiveness of the sweet-smelling hay, would lure the most refractory of bullocks to enter, even were the door-posts inscribed in characters intelligible to the bovine understanding with the warning, 'Abandon hope, all ye who enter here.'

Each animal is allowed food, bedding, and fresh water *ad libitum*—advantages of which it takes full benefit, thinking but little, as it chews the cud of reflection, of the fate now so closely impending. Perhaps the most striking feature of this vast collection of live-meat is the individual resemblance that obtains between each. All are plump, well-fed bullocks, of much the same height and proportions; and each thinks, no doubt—if it be given to him to think at all—that he has lighted upon good times. So he has undoubtedly, while they last. The transitoriness of things terrestrial, however, is proverbial, and applies to conditions bovine as well as human. After a few days spent in this peaceful and quiet retirement, there enters to the bullocks the buyer, who, with the skilled eye of the connoisseur, makes selection of the beasts he requires. He then takes from his pocket a pair of scissors, and shears from the hide a small portion of the hair, so as to leave a bald cross, a circular patch, or a triangle, according to the device he has adopted as his mark. This is the signing of the death-warrant. The selected beasts are led out into the open and penned at the entrance to one of the many slaughter-houses. The end is near now. A sliding door is pushed back, and one by one the beasts are led into the shambles. Here, in a few moments, all is over; and in as many minutes more, the beast that entered full of life and vigour is killed, divided, and dressed ready for the market.

A party of English tourists were once being shown over a great hog-killing establishment at Chicago, when an American present boasted, with all the complacency of wanton utilitarianism, that everything relative to the poor hog was used in some way or other. 'Nothing is wasted,' he said; 'everything is used save the poor animal's dying squeal, and we would use that too, did not the hog need it to die with.'

The bullock slaughtered in England is not allowed this luxury, nor is it necessary—everything is swift, sudden, and silent. When the carcass is dressed ready for the market, it is suspended from a line of overhead rails, along which it can be run into the cooling chambers. In the summer-time, refrigerating rooms have to be used, and are then in great demand, as will be readily imagined from the magnitude of the work

performed. The lairages have railway connection with all the principal lines in the kingdom; so that the meat passes out of the cooling chamber into the meat van which is drawn up at the door, not to be again handled until its final destination is reached. It says much for the despatch with which the business of this lairage is conducted, when it is stated that, during a busy season, meat has been placed upon the London market within thirty-six hours after the live beasts were landed from the cattle-ship. At the Woodside Lairage there is, as we have said, accommodation for 3500 head of cattle, and during a rush there have even been more than that number patiently awaiting the mandate of the buyers. There is something impressive in the sight of this vast collection of patient ministers to our wants. We have stated above that they are young bullocks in prime condition. Occasionally, however, one sees beasts that bear evidence of having been employed as oxen frequently are in new districts where horses may be scarce. All, however, have attached to their ear a metal tag, which bears an identifying number. This serves a double purpose. In case of disease, it is possible, by referring to the number, to find out the port of shipment and the district from which the diseased animal came. The tag is left attached to the hide when the animal is dead, and all such labelled hides are admitted to the States duty free as home-raised products. The transatlantic trade in wet hides, however, is not so great as it was some years ago.

Although eighteen hundred is the record of beasts slaughtered in a single day at the Woodside Lairage, the usual number falls much short of this. No doubt, the average weekly number of American cattle killed and dressed at the two lairages on Liverpool's vast Dock estate lies between 6500 and 7000, which gives a total of over 200,000 for the year.

Shakespeare puts into the mouth of Salisbury, when he becomes apprised of young Arthur's death, the line, 'The uncleanly savours of a slaughter-house.' However aptly such an adjective as uncleanly might apply to the slaughter-houses of Shakespeare's time, it is by no means applicable to those under discussion. Cleanliness is insisted upon, and secured. Nothing is wasted. Those portions of the beast that usually come under the term offal are all of them carefully marketed. Nothing is lost. To say what becomes of them, however, is a very delicate matter. The fatty products undergo an initial clarification process by being steeped in brine. They are then, after further preparation, used in the manufacture of margarine and kindred apologies for butter. The bulk of the fatty matter so used is exported to the Continent, whence much of it is sent back to England as oleo-margarine. It need not be said that this fatty matter is perfectly clean and wholesome; and if the oleo-margarine of which it forms part is sold as such, and not as butter, there can be no reasonable objection to the commodity as an aid in domestic cookery.

Such are the more salient features of Liverpool's share in the imported live-meat trade, a trade which has developed with phenomenal rapidity. In addition to the enormous number of live cattle imported into the country, there must be considered the dead-meat which is

brought also. It is only by summing the two that we can form any idea of the extent to which we are dependent upon lands outside our own island cluster to supply us with the most elementary necessities of daily life.

MISS HELEN.

By VIVIAN BROOKE.

ROWDY! 'Tis no word for it—too genteel by half. We were as wicked a set, at our diggin's, as New South Wales could show—no slight thing. If the world's kettle had been set on the boil, we'd have come to the top as prime scum—truth, and no lie, mate. But amongst us was a man dubbed 'the Squire,' because, though he fared like the rest of us, toiled, lived, and dressed just as we did, yet there was that in him which stamped him as of quite a different breed. Swells out of luck are to be found by the bushel in Australia; still, I never came upon *his* double before or since. Rumour went that he was a Baronet at home in England, but had been forced to cut and run; so he tried New South Wales and the gold diggin's, bent on succeeding.

I found him at Green Valley Creek when I reached it; we worked not far off each other. I can't say I liked him, though he was wonderfully quiet and civil spoken, but cold as ice, and hard as nails; a chap who was never tired, and who never gave in, but plodded on and on towards his own end, whatever that might be. But silent as he was, and selfish, he opened out a bit to me, pra'ps because, though I didn't set up either for a swell or a saint, I wasn't quite so bad as the worst in Green Valley Creek. I had been respectably brought up, the son of a small farmer in Kent; but I didn't go in for respectability myself; it never agreed with me; so I was sent adrift at last with fifty pounds in my pocket, and the world before me. There was a fresh stampede towards Australia at the time, and I joined the general rush and scramble; and, as I say, when I had settled down at my claim, 'the Squire' and I scraped up a sort of friendship.

He did not live alone; his daughter was with him, though how and when she reached him none knew; she *had* reached him, and bore her strange life as best she might. They dwelt in a small shanty in the midst of many pines, a poor rough place, far apart from the other huts; a queer frame for such a stately picture of a woman—a lady! with the same superior bearing visible in her father. I'd walked that way with 'the Squire' once, and she ran out to meet him. The sight of her struck me all of a heap, so unexpected in the lonely spot, where there was no other company than the bright-winged birds, no other sound than the stir of the windy trees. She was tall, the colour of wild roses in her cheeks, Heaven's blue in her eyes. Her dress, dark and close fitting, had none of the flashy ornaments that women such as *we* take up with cram on; her hair, coiled smooth about her head, shone like black satin.

'This is one of my—chums, my dear,' said 'the Squire' with his soft voice and his hard smile.

Since then, I had hung about the log-house

often, labour ended. I fetched water, got in sticks, cleaned boots, or did such odd jobs which were not fit for her, and said no word; but she found me out in a brace of shakes, and grew used to and was thankful for such help as I could give, knowing that I meant no harm, though I startled her at first—a great Orson of a chap in my rough gear.

One evening I came on her watching in the gloaming. How eerie it was there underneath the trees; the wind soughed through the branches, bringing a dash of rain; a deluge was in the black clouds sweeping across the sky.

'I am anxious about my father,' she said, looking like a tall white lily that somehow had been shoved into the wrong pot, and touching my big earth-stained fingers with her fine slim hand. 'I am always anxious about him; though, since knowing you, I have not felt so absolutely distressed, for I am glad to recollect that you are within his call. You would stand between him and harm, I think.'

'Why, yes, miss; make your mind easy on that score; 'twould be done with a will.—But what harm is like to come, that you need hurry?'

'Oh, but, Mr Straightways, it is such a hard, dreadful life for him.'

'And for you, miss!'

'Ah, but I will not think of myself; that would never do,' she answered quickly; and going indoors, she began to tidy the scrap of a room, thus trying to rout her terrors.

'Ned!' she cried, stopping suddenly (her father always called me so), 'I had such a curious dream last night. I dreamed that I went down into the little valley beyond the wood, and there I saw my father lying on the grass sound asleep—so sound that I could not wake him; whilst the clusters of wild-flowers sprang up so high that they hid him, and I heard the pines in the distance chanting a solemn kind of litany. I was crying when I woke.'

'You are too much alone, miss, and grow nervous.'

'Perhaps. And then—I am troubled about his journey to Goulburn to-morrow, and his taking so much value with him.'

Goulburn, as I suppose everybody knows, is the chief place in the southern gold-mining district; we all went there at times to get our gains weighed, or changed, or banked.

'My father has been very fortunate lately, has he not?' she asked.

'He has had some good finds, miss; and to-day he got hold of two jolly big nuggets.'

'I am glad. Will he bring them home this evening?—What's that?' and she sprang to the door, flinging it wide open, the shine of the lamp behind her. 'Dearest father!' she cried, 'is it you?' But she broke off, alarm in her voice: 'Ned! Ned!' for no father was there, but two of the worst of our lot—scamps for whom hemp was growing; the one a blackguard sailor; the other, a smartish, slimy chap, thin, dark, lying. His name was Phil Dawlish.

I remembered now, as I saw him by the flash of the light, that he, as well as I, had been near when 'the Squire' held up the two great nuggets; and it struck me—I'm quick at conclusions—that both scoundrels had not intended to come

up to the house, but were just lurking round—What for?

Miss Helen—I only knew her by her Christian name then—faced them steadily, though she had called me to her, and asked what they wanted.

'Why, nothin' in special, miss,' stammered Dawlish, lifting his ragged straw hat with swell-mob politeness, and a leer which made me tingle to kick him; 'on'y, is the old Boss at home? I—I mean your Pa, miss,' he translated.

'No,' she replied, holding her head high, to show she was not frightened; but I, being close to her, could hear her heart thudding like a hammer, whilst the blood flamed to her brows under the foul gaze roving over her. 'Why do you ask?'

'Just this, mum. Will you be so good as tell him that me and my pal's off to Hulton's Ranch for a short spell, and if he'd like to tramp over—why, 'tis a mighty 'andsome part o' the country, and he'd be welcome, that's all.'

'You must be in a hurry to go,' I said, putting in my oar, 'if you're trudging twenty mile for pleasure such a night as this.'

'Oh, we didn't know as *you* was in charge here,' with a british laugh; 'but the walk is our lookout; the lady can deliver a civil message, I hope!'

'I will give it,' interposed Miss Helen, 'as soon as my father comes in.'

'Much obleeged, miss; then theer's nothin' more to add; so we'll toddle.—Good-night, miss,' and he flourished his hat again.

She shut the door upon them, drawing a stout bar across it. 'Are those the men *he* works with?' she cried, flinging up her hands.—'Heaven help us!'

I tried to turn the subject, stirring the fire into a blaze, and pretending to do a lot of things, for I didn't care to leave her. 'Twas my belief the two blackguards were still hanging about. As for their invitation to 'the Squire,' it was but a lie invented on the moment.

I was casting round for another job, when she stayed me by asking if I would go to meet her father.

'But you'—

'Nay; I do not mind. The little house is secure. Why,' with a wistful smile, 'I am always alone from daybreak until dark.'

I knew it was the fact; so, bidding her open to none until she heard me or 'the Squire' whistle, I started on my errand.

Not very far had I to go, for I met him in that same little ravine of which his daughter had dreamed; it skirted the pine-wood. His pick was over his shoulder, his right hand in his pocket—feeling the nuggets, perhaps. He was singing a song in some foreign lingo, Italian or Spanish. He looked more content than I had seen him—more at rest, nodding to me in his patronising fashion. After a few stray words, I related what had happened, advising him to be on his guard.

'Thanks, I will,' he replied, haughtily amused at the scamps asking *him* to pay a visit in their company. 'But I've a secret to tell you, Ned,' he added. 'I have done with Green Valley Creek, and shaken off its crew. Luck has favoured me beyond my hopes; I can afford to turn my back upon it. I shall take my daughter

—she does not know it yet—with me to Goulburn to-morrow, where we shall remain for a short time, then go on to Melbourne; I have thoughts of settling there.'

As he spoke, the little tie of comradeship between us shattered: in a moment we were sundered as the Poles, so quietly he brushed it away.

'If you like to step round early in the morning and see us off, you can.—Why, my good fellow, you look quite down. Well, it is kind to be sorry to lose me. We shall meet the wagons at the end of the wood. If those scoundrels intend to dog my steps—I agree with you their trip to Hulton's is only a ruse—I should find your company useful; also, you could help to carry our few belongings. I paid up my rent to Johnson at the tavern last night; perhaps you'd kindly give him the shanty key?—Why, Straightways,' with laughing surprise, 'has my news struck you dumb?'

I felt as if it had, as if I were shot through and through; the earth swayed under my feet. He was condescendingly gratified at my troubled state, taking it all to himself; he was just the man to do it.

'You were always an honest fellow, Ned!—a trusty creature! Be sure that you come to-morrow; my daughter will like to shake hands with you before she leaves;' and he went on gaily through the rich, thick grass.

No rest was mine that night; evil was in the air. So, as I could not sleep, I got up and went out. Not being a fool—I knew I must keep my misery to myself; but my life was empty! empty! It held a vacant place that coul' never be filled—never again! never again! You see, I was hard hit, mate, like the donkeys. I stamped and stormed at myself for a mooning idiot. What was Miss Helen to me? What could she ever have been to me?—a lumbering, vagabond chap, not worthy to kiss the dust she trod on.

But I must go back and watch the house that covered her for this last night, so I returned to the ravine. In it were many little dells swarming with the wild-flowers of the grand Australian spring. Now, in one of these same dells what do you think I saw?—a dead man's face. Yes, I knew at once that he was dead; but so easily 'the Squire' rested on the wet moss, that the song I had heard him singing might still have been upon his lips. Raising his head, I found a blow aimed from behind had killed him. He had dropped and died at once. His pockets, turned lining outward, were empty. Snatching up his fallen pick, I tore on to the log-house, knowing well whom I should find there—my long sharp knife was in my belt. I raced round to the back—the little kitchen door was undone; the fiends in possession had small fear of interruption. They were in 'the Squire's' bedroom, making free with some whisky which he had kept in a cupboard. Gold was there also, as I knew. By their shouts, I fancied they had come upon it. But I let them be. Where was Miss Helen?

I found her in the sitting-room, tied in her chair, her lips bleeding over her white teeth; the cursed hounds had struck her. 'There are three of them,' she whispered; 'those two who came, and another man. They watched for my father,

and murdered him—they told me so.—Hark! they are coming. Ned, they have pistols, and will shoot you where you stand. Go away this instant—only—kill me first;’ and she lifted her white pillar of a throat.

‘Now, my beauty,’ roared a drunken voice through the thin partition, ‘we’re bringin’ you a cup o’ whisky to drink our ‘ealths in. Ain’t you longin’ for us to make love to ye? We’ll stow away the rhino first, and *then*—you shall have your turn.’

‘Be quiet,’ I whispered back to her, hacking at the cords with my knife; and in a few seconds I had her out of the chair, and we dashed out of the house together. Seizing her hand to prevent her from falling, I guided her as fast as possible from the crew who were now following after us with curses and howls. Fortunately the demons were too drunk to run very fast. A couple of bullets whizzed by us, striking the tree-stems instead of our heads. In our desperate haste, we stumbled and fell more than once over spreading roots, but were up again in a moment.

On and on and on until the last tree was at our backs. Then we made for a lane which led to Johnson’s tavern, leaving the yells faint in the distance; there we stopped, and there she told her tale.

News spreads quickly at the diggin’s, and Judge Lynch is for immediate action. Before noon, the stolen gold—including the two big nuggets—had been recovered, and a couple of figures dangled from an oak by the wayside; whilst the third villain, not guilty of bloodshed, shed plenty of his own beneath avenging blows. We had a habit of settling matters speedily at Green Valley Creek.

As soon as it was possible, Miss Helen started for Melbourne, whence she was to set sail for England, where she would join her mother’s relatives—very heavy swells indeed, I believe. And I followed her in secret every inch of the way, though she knew it not until I stood by her on the deck of the steamer, after I had helped to stow her boxes safely in the hold. Then I blurted out that I hoped she ‘would not be offended at my coming, but’—And then I shut up.

‘Ned!’ she cried, ‘brave Ned! dear, kind, good Ned! There are debts which can never be repaid, and I am your debtor always—always, Ned!’ and holding out her hands to me, she bowed her lovely head upon my big brown fists and sobbed.

‘Don’t you be a confounded noodle at the last, Straightways,’ I said to myself *of myself*; ‘you’ve pulled the reins in fairly well up to the present; pull tight, my man, pull tight;’ and I did.

‘You are very welcome, Miss Helen’—I spoke with a quiet voice. ‘I wish—I wish—I could have been a gentleman for just a little while, so that I might have served you better.’

‘A gentleman!’ she cried, lifting her face, and looking full at me, and then she raised these hard fists of mine to her soft lips and kissed them. Yes, she kissed them—and I!—how was I to help it?—the touch of those soft lips broke me down smash. Away went all my self-control, as if the winds had blown it, and up from my heart, like a pent stream bursting its bounds, rushed the strong surge of love and adoration,

which—having broken loose at last—wouldn’t be driven back. I can’t remember clearly what I said, though I’ve tried—often; the whirl and tempest within me were too much. I didn’t *plead* with her; no, no—I knew better than that, even then in the midst o’ my madness. I didn’t dare even to touch her with one of my rough fingers, but I think I made her understand somehow that my heart and my life had gone out to her for evermore. Then I stopped, sudden, my chest heaving, my voice choking, my sight blinded by a mist that didn’t come from the sea. I stopped because of the great start of surprise that shook her from head to heel, and because of the red colour flooding up to the roots of her hair. Yet she was not angry—nor offended. She put out her little hands to me again, meaning—I knew it—both to silence and to comfort me. She did not speak—for what could she have said?—what could any stately lady such as she have said?—besides, the steamer’s engines were puffing, and time was up. She laid her head down on my arm a moment, and then left me with a rain of pitying tears.

When the vessel had passed completely out of sight, and its long smoke-line had died out from the sky, I hurried back to Green Valley Creek, and took up my work again—hard work is the best friend life has for us, sometimes.

But I have never forgotten Miss Helen—I never shall forget her; and I’ve trudged to the old spot often and stood before the empty house. And when the sun flamed down behind the pines, and the shadows crept longer and longer across the grass, I’ve had a fancy that I still could see her at the open door—watching for her father.

That’s my story, old chappie; we’ve each our own, of one sort or another.—Fill up your glass, and let’s have a pipe.

THE LITTLE FEET.

A MOTHER’S VILLANELLE.

Across the lonely chamber floor,
And down the passage, through the hall,
The little feet resound no more!

There cometh through the open door
No merry voice, no laughing call
Across the lonely chamber floor;

But where the sunlight flashes o’er
Gray tapestry and pictured wall,
The little feet resound no more!

Perchance upon a distant shore
They wander now—no more to fall
Across the lonely chamber floor.

Why comes the summer to restore
Bright hollyhocks and lilies tall?—
The little feet resound no more!

Alas for Hope’s deceptive lore!
Her words are desolation all;
Across the lonely chamber floor
The little feet resound no more!

WHY BANKS FAIL.

THE recent series of banking failures in Australia is beyond doubt one of the most grievous financial calamities on record, and a severe blow to the prospects of the great colonies affected by it. In the course of a few months we have seen more than a dozen banks—amongst them some of the leading financial institutions in Victoria, New South Wales, and Queensland—obliged to suspend payments; banks possessing an aggregate of over eight million pounds of paid-up capital, and owing to the public in the colonies and at home about seventy million pounds in deposits. This is a disaster as to the magnitude of which there can be no question, and the widespread consequences of which must be felt for a long time to come. We may hope, however, that in the end the losses involved may be much less than would appear to be threatened by the wholesale nature of the breakdown. If time be granted, reconstruction or, if necessary, liquidation may prove that many if not most of these banks have twenty shillings in the pound, and something over, for all their liabilities; but this is for the future to show. In the meantime it would be a pity if the calamity were taken to be a mysterious dispensation, instead of an object-lesson as easily grasped as it is instructive.

Of all great trades, banking is one of the simplest in the principles that regulate it. The intricacy and multiplicity of detail involved in the administration of a large bank in modern times does not at all affect the great rules which, if kept in mind, will ensure safety. Prudence and common-sense, as well as shrewdness, judgment, and decision, may be said to sum up the whole mystery of bank-management; a high degree of skill is not always demanded, whilst a bold and enterprising spirit may be out of place. Yet our own time has furnished many instances in which the most ordinary precautions have been neglected, and well-understood conditions of security have been ignored, with the most ruinous results. No species of commercial failure may be avoided

with more certainty; nor is there any that is fraught with more serious trouble to the community at large. This is a good reason for studying the lessons of such events, and reiterating the plain principles which should suffice to obviate them.

The development of the crisis in Australia has been accompanied by a panic of the worst kind, carried to a degree of madness unusual even at such periods, and the whole brunt of it has fallen upon the banks. It may therefore appear sufficient to some to affirm that these wholesale suspensions are in no way due to the wise or unwise policy followed, inasmuch as no bank could stand under such a violent and unforeseen attack. Although there is not only plausibility but a certain amount of truth in this plea, it is by no means the whole truth. For we have to inquire, first of all, how the crisis originated, and whether the banks themselves have had any share in bringing it about. In our own country we have only too good reason to understand what may be called the natural history of a commercial crisis. During the last seventy years, financial convulsions have recurred with great frequency, and the course of events has on each occasion been almost invariably the same. There comes, first of all, a period of unwonted prosperity, during which prices rise, trade expands, savings accumulate, and the supply of floating capital available for investment is more than usually plentiful. The cheapness or the abundance of money seeking fresh outlets paves the way to new enterprises and projects. An investing or speculative mania ensues, by which the abundant supply of available capital is speedily exhausted and turned into a scarcity. When this point is reached, reaction is at hand; prices fall, credit collapses, and all that has been unsound and factitious in the previous inflation is disclosed. Before this process has gone very far, it becomes intensified by alarm or panic, assuming the shape of an overwhelming demand for actual cash, the possession of which is rendered an imperative necessity, both for merchants who have obliga-

tions constantly falling due, and for bankers who owe to their depositors large sums that are liable to be asked for, in coin or some form of legal tender, at any moment. This is the final stage of the crisis, attended by the bankruptcy and ruin of those who have not in due time made ample provision against its dangers.

Commercial crises may sometimes pass without any considerable banking failures; but whenever they arrive, it may be taken for granted that many banks suffer severely, and that not a few of them have contributed to the inflation of business by the undue facilities which they have afforded in the time of excitement. Banks can do much both to check and to foster the mania. By refusing to extend credit unduly, or to advance on shares of speculative concerns, they can effectually discourage over-trading and gambling; on the other hand, should they catch the fever themselves, they may enlarge the mischief indefinitely. In countries like our own, where the credit system is highly developed, banks are the reservoirs in which the floating capital of the country is stored, and it is from them the supply must be drawn for any great extension of trade, whether legitimate or otherwise.

One risk which besets all trades is peculiarly dangerous to banking—the risk arising from eager competition. A community may have too many banks, for a number in excess of real wants must lead to the too ready acceptance of questionable business. It is not only possible for banks to foster over-trading in others; sometimes they themselves sail much too near the wind, and crowd on every inch of canvas. In the stress of competition, moreover, it is too frequently forgotten that the banks have common interests, which can only be properly safeguarded by mutual agreement and combination. Australia is decidedly over-banked. Not only is the number of banks excessive, but the deposits entrusted to their keeping at high rates of interest appear to be larger than can as yet be profitably employed in the development of legitimate enterprise. 'Raw haste, half-sister to delay,' has been the characteristic of trade in the Australasian colonies for some years past, and we fear it is not too much to say that it has appeared also in the financial policy of the colonial Governments. The latter have not entirely escaped the discredit involved in recent events. During the last ten years, particularly in the amount of their borrowings for public works and other objects, they have outrun even the rapid growth of colonial resources, and thereby inflicted damage, which it may be confidently hoped is merely temporary, upon their own credit.

The special feature of the Australian trouble has yet to be mentioned. The speculative mania, the collapse of which we are now witnessing, spent its chief energy upon landed property. It was a 'land-boom'; real estate in its various forms was the security upon which the funds of the banks were largely advanced, and it is that in which they are now locked up. This, of course, is against all the recognised rules of sound banking. It may be considered an accepted axiom that real estate is not a proper 'banking

security,' because not readily convertible into cash, and that no bank can safely advance upon it except to a most limited and carefully guarded extent. The National Banks in the United States, for example, are actually forbidden by law to lend on real property, the only case in which they are permitted to deal with it being where they receive it as collateral security for the repayment of a bad or doubtful debt. All these considerations were probably familiar enough to the directors of the colonial banks, but it has long been their practice to advance on mortgages of all descriptions. They held great masses of deposits at interest, and if they were to earn a dividend, had to find profitable employment for the superabundant means which were constantly reaching their hands—a task the difficulty of which was much aggravated in recent years by the depression which narrowed the field of legitimate banking business. The obvious remedy was, instead of extending their sphere of operations, to reduce their rates of interest on deposits to such a point as would attract no more than could be profitably and legitimately used, and also to provide against the deposits held on 'demand' or at short dates an ample provision of ready cash and securities of the most 'liquid' description.

There is another cause of peril to the solvency of banks which has played a fatal part in most of the great bank failures that have taken place in our own country within living memory—namely, the absorption of an undue proportion of a bank's resources by a few overgrown accounts. The temptation of large accounts, easy to manipulate, but disproportioned to the means of the bank, has over and over again been the immediate cause of insolvency, and in too many instances has led to the falsification of balance sheets and to other forms of fraud. We have had painful occasion recently, in the deplorable case of the Liberator Building Society, to observe that it is not only banks that are liable to fall into this dangerous snare. The story of the collapse of the Western Bank of Scotland in 1857 is a typical example; four great firms alone, at the time of their insolvency, owing the bank nearly two million pounds, although the whole capital of the latter was only a million and a half. In the case of the Northumberland and Durham District Bank, which also failed in 1857, and which had a capital of about six hundred thousand pounds, there was one company amongst its debtors, the Derwent Iron Company, which owed the bank £947,000—a circumstance which found a somewhat sinister explanation in the fact that the managing director, who was the moving spirit of the whole bank, was also largely interested in the Derwent Iron Company. It was the same kind of error, aggravated by fraudulent and criminal dealing, that appeared in the ruinous breakdown of the City of Glasgow Bank in 1878. So well understood has this risk of bank administration become, that in the United States it is guarded against by a statute which prohibits a bank from lending to any one individual, corporation, or firm an amount exceeding a tenth of the bank's paid-up capital. Whether the affairs of any of the Australian banks have been complicated by mismanagement of this kind has not yet been shown, but it will be a matter both for surprise

and congratulation if they have entirely escaped it.

In one respect the calamity which has just befallen the colonial banks is a striking and most necessary lesson to bankers everywhere, for it puts in a very clear light the obvious principle that where great deposit liabilities exist, the first condition of safety is the provision of a proportionate cash reserve, usually estimated at one-third of the liabilities. To avoid the expense of such a reserve, and to employ resources closely, will no doubt swell the dividends of a bank; but at the same time such a policy endangers the stability of the entire fabric. And this is especially a word of caution to British bankers, for the disproportion between their deposit liabilities and their cash reserve is enormous, and has vastly increased during the last quarter of a century. In banking administration, the first and last consideration should be *safety*. 'Slow and sure' may be a disagreeable motto in our impatient haste to be rich; but it is the only trustworthy counsel in building up a great banking business that is meant to be solid and lasting.

THE BURDEN OF ISABEL.*

CHAPTER XXVIII.—'THE PLAY'S THE THING!'

ISABEL speedily provided herself with a constant chaperon, by having one of her Aged to stay with her week by week. But the Aged did not give her so much countenance as her father's presence had given her to invite Ainsworth to tête-à-tête visits. Yet, as it happened, that mattered little; for Ainsworth was sitting very close to his desk to manufacture his play—his stake for success—and was little inclined to tear himself from it even to see and to speak to her who was the remote hope of his heart.

Ainsworth had been for months hard at work on the play. Soon after the departure of 'the chief,' Alexander joined him as an active coadjutor, while he lodged in the same house, in the second-floor back. He did not help to construct the drama or to write it, but he listened with flattering attention to the reading of scenes, and went forth into the byways of journalism and talked about them; and his acquaintance was, like Sam Weller's knowledge of London, 'extensive and peculiar.' There was not a newspaper office, big or little, between Charing Cross and Ludgate Hill but he was on some kind of speaking terms with; he knew the men who wrote the paragraphs everywhere about everything; and he exchanged salutations with the frequenters of all the bars of the Strand and Fleet Street. So it came about that such greetings and expositions as these often passed when he showed himself in one of his favourite haunts.

'Well, Alexander, how goes the play?'

'The play! What play?' said Alexander, affecting absence of mind.

'Your friend Ainsworth's play! the masterpiece!'

'The play of Mr Ainsworth,' said Alexander portentously, 'is not to be lightly spoken of. It goes exceedingly well; and it will take the wind

out of the sails of one or two writers who believe themselves dramatists. The Great Panjandrum is, I believe, smelling after it; but he buys a play only to put it in a chest to grow mouldy and out of date. Mr Ainsworth and I understand business better than have dealings with the Panjandrum.'

It was not unlikely that Alexander himself was responsible for one or two of the paragraphs which appeared, for Ainsworth had turned him on to assist him in 'doing' the theatres, and had found that, with a little editing, his stuff passed as tolerable work-a-day journalism; and at the same time he had found him occupation as a purveyor of gossip on one or two journals—notably on that Lancashire journal whose staff he had once himself adorned. Certain (not all) of the paragraphs caught Ainsworth's eye, and he was very wroth.

'This must be from your gossip, Alexander!' he said. 'And I wanted the whole thing kept secret.'

'But, Ainsworth,' said Alexander, 'the way to get your play forward is, first, to get it talked about. I flatter myself I have worked that very well. I am proud of the result.'

'I am not!' said Ainsworth. 'It may seem ungrateful in me, Alexander; but I am not. And I beg of you that you will henceforward say nothing at all about it; or, if you must say something, since you have begun, say something that will put people off the scent. Understand, please, my dear fellow, that I want the time and the place of its production—if it ever is produced—and its author's name kept secret. Don't be offended with me; but I have my good reasons.'

'My dear Ainsworth,' said Alexander, 'I know them. You have not, if I may say so, ~~the~~ your flame under a bushel.' And he shook with laughter at his joke.

'What do you mean?' said Ainsworth, scarce knowing whether to be angry or ashamed.

'My dear Ainsworth,' said Alexander, 'you know what I mean very well. I do not wonder at it. I only wonder that, after seeing her and knowing her, any man could take the smallest degree of interest in another woman. . . . What says Tennyson? "A daughter of the gods! divinely tall, and most divinely fair!" Even the miserable individual before you is subject to her fascination.—But do not be alarmed, my dear Ainsworth. I have no pretension to have engaged anything but her most friendly regard. I pay my homage from afar off, and beat upon my breast. I am not worthy of her; indeed, I am by no means certain that you are—or that any man is.'

'I thank you for that last clause, Alexander,' said Ainsworth: 'it soothes my vanity.'

'And, let me take the liberty of telling you, Ainsworth,' said Alexander, brimming over with his subject, 'that you have an immense amount of absurd vanity.—I venture to think,' he continued, with heavy emphasis, 'that I know a good deal of women; and I mean and I say that you do not understand Miss Raynor. You are vain enough to wish to get to her level of wealth by your play; and you do not understand that she is the kind of woman that thinks nothing of fortune!—you do not understand it, Ains-

* Copyright reserved in the United States of America.

worth!—that if she were fond of a man she would follow him to the end of the world, though he had not a penny to bless himself with, and she would pour out all she had upon him with generous profusion.'

'I do not understand that?' exclaimed Ainsworth. 'I understand that only too well! That is why I stick to my play and hold my tongue; because I would not take advantage of her generosity. I will not be thought by any one to be a fortune-hunter. I shall go through with the play.'

'Very well,' said Alexander. 'I knew you were an obstinate mule. Lancastrian and Scotch make a bad cross,' said he meditatively.

There was one man of consequence who was moved by the paragraphs as to the new play. The manager of the Variety Theatre—himself an actor—was in desperate plight. For some time he had touched nothing that had paid him; he had lost faith in the established playwrights, and publicly sneered at them, and he had a great mind to try a bold—it seemed to his theatrical acquaintance a reckless—experiment: to produce a new play by a new writer! He had heard of this young man, Ainsworth, and he knew he was generally thought well of as a dramatic critic; he was aware—he had frequently proved it by example—that it was seldom a critic of the drama could write a play, but yet it was not conclusively proved that a critic could not; so one day he sat down in his room at the theatre and scribbled a note to Ainsworth:

'DEAR SIR—I have seen it mentioned that you are writing a play. You are acquainted with the requirements of this theatre. If you think your play is at all likely to suit my requirements, send it to me (type-written) when it is finished and I will read it.'

'Hooray!' cried Ainsworth when he read the note. 'Of course he promises nothing, and I know the chief requirement of his theatre is that a play should contain a part for him.—I think mine contains that, Alexander; and after all, it is an immense deal to get a spontaneous offer even to read it!'

'And yet,' said Alexander triumphantly, 'you entertained the opinion that my gossip was nothing but pernicious!'

CHAPTER XXIX.—RUMOURS OF EVIL.

It happened that on a certain evening at this time—while the two aspirants to her hand were both striving their utmost, in their own way and without her knowledge, to win her worthily—it happened that Isabel was invited to a political dinner at her uncle's. The dinner was going to be, her aunt told her, a very important affair—something in which the fate of parties or of ministries was involved; for the Suffields were now very important people. They were going on from strength to strength in the way determined by Mrs Suffield.

The dinner-party was large, so that the conversation between any pair was little likely to be attended to and taken up by the whole table: there was something of the privacy of a crowd about it. Lord Clitheroe had taken Isabel down to dinner, and presently—they had a frank and

friendly regard for each other—he began to speak of a matter that arrested her attention.

'It is lucky,' said he, 'that I was asked to take you down, Miss Raynor, for I wanted very much to talk to you; and it will be so much easier to talk now than afterwards, when people are dodging about, and in and out of the drawing-rooms. Don't, please, look startled or indignant with anything I may say: we don't want to attract notice or inquiry.'

'It should be something very interesting and piquant that you have to say,' observed Isabel, 'judging from your introduction.'

'It is more than interesting,' said he seriously: 'it is of the greatest consequence. Do you ever, may I ask, hear from your cousin George?'

'No,' answered Isabel with a blush, 'I don't.'

'Well,' continued Clitheroe, 'I have learned, quite in a private way, that he is concerned in very risky cotton speculations.'

'I know nothing about such things, of course,' said Isabel; 'but do you think that is likely to be true?'

'I know it is true,' answered he. 'The fact is, between ourselves, I have seen evidence of it with my own eyes. You know—or you may not know—that I am partner in the Lancashire bank which takes charge of the Suffield money, and I have seen large cheques and acceptances which leave no doubt that he is engaged in risky cotton speculation with one or two very doubtful foreigners. You will understand I am telling you this quite in confidence. Perhaps all the danger of it does not strike you; but he has no business to be engaged in speculation at all, and that particular kind of speculation is likely to be most ruinous, especially to a man who cannot give all his attention to it. It is even possible—if he goes on—that he may in a short time ruin his proper business and ruin his father along with it.'

Isabel looked at him shrewdly, and he blushed under her look.

'Do not, please, misunderstand me,' said he. 'I am not anxious on my own account. I would marry Phemy whatever happened—though I have no doubt I would have trouble with my people. I am anxious on George's account, whom I like—he is a very good fellow, though a little too strongly convinced of the accuracy of his own judgment—and on Mr Suffield's account, who is the best man in the world. I would speak to George myself about it, except that I am afraid of being misunderstood; and of course it would not be fair to speak to Mr Suffield. That's why I have spoken in confidence to you.'

'You think I should speak to him, or write to him about it?'

'I know,' said Clitheroe, 'he thinks more of your opinion than of that of any one else in the world.'

Isabel did not answer. She went home very soon, and entered her drawing-room.

'Don't go to bed just yet,' she said to the maid who had admitted her and who turned up the light; 'I should like you to run to the pillar-post with a letter in a few minutes. You won't mind, will you?'

She sat down at once to her writing-table to compose a letter to George. She found it a more difficult task than she had anticipated: to avoid appearing too warmly interested in him, and yet

be consily, affectionate, and frank; to express the fear that he was embarked in dangerous speculations, and yet not stir in him resentment and suspicion. She accomplished it, however, with tolerable satisfaction, and sent it to the post by her maid. But still she sat at her writing-table—sat with her chin in her hand, and the lace of her sleeve falling away, like foam of the sea, from her white, rounded arm. She was thinking closely, thinking of that matter which had occupied her ever since Lord Clitheroe had said that George's present course might end in her uncle's ruin. It had come on her at once like an inspiration—with the joy as well as the suddenness of an inspiration—that if that should happen, there was one clear thing for her to do. She would transfer to them the fortune which Uncle Harry had left her, and she herself would turn to again and earn a living for herself and her father; her Aged need not suffer, for there were many friends ready to help her to maintain them as they were. What should she do?—return to school-teaching? She was not fond of teaching. Alan Ainsworth had once told her she ought to be a novelist. Who knew? Perhaps she might become a novelist, or, at any rate, a writer of some sort. From that she fell to thinking of Ainsworth, and then of George; and so she went to bed.

Next day there came in a singular fashion a suggestive indication that Lord Clitheroe's suspicions of George's speculation were not astray, and that even George's father was somewhat troubled in his mind concerning his son.

A question had arisen respecting our administration of a certain part of India; and there was expected a debate in the House of Commons on Indian affairs. Suffield was to have spoken, but at the last moment failed to rise, and his friends were disposed to chaff him for his backwardness.

'To tell you the absolute truth, my lad,' said Suffield to Lord Clitheroe, as they walked out to their carriage, he leaning on Clitheroe's arm, while Isabel walked immediately in front of them, and so overheard his words: 'I went into the smoking-room for a whiff, and there was a man—one of the Liverpool members—saying that there are still strong suspicions down there that some person is trying on a "corner" in cotton, a foreign creature called Gorgonio—do you know him?'

'I? No!' answered Clitheroe.

'I thought you gave a start when I named him. George knows him, though—we met him in the summer in Douglas—and I wondered, if there is a "corner" likely to be on and he knows of it, why he hasn't told me. And if he doesn't know, he ought to know, to lay in enough cotton in time; for about th' end of th' last "corner" prices went up, so that I couldn't afford to buy, and had to put the mills on half-time.'

'Why don't you write to George about it, Mr Suffield?' asked Clitheroe.

'Well, I did write to him a month or so ago, when that article of M'Fie's appeared. And his answer was pretty much "Stuff and nonsense!" I don't like to write again in a worrying way; because, you see, he's young, and if you want a young horse to go well, you mustn't *tear* at the reins. But that bothered me, and I couldn't think of my speech. It was like a bit of grit got

into the delicate machinery of my brain, and it wouldn't let my speech unwind. I think I'll go down and see George: that'll be best.'

To Isabel, who was present, that seemed evidence of far stronger quality than it really was that the ruin of her uncle was imminent. 'Poor uncle!' she said to herself. 'To lose all that himself and aunt worked so hard and for so many years to get together! Dear, dear uncle! Oh, how glad I am!—how I thank God!—that I am able to do something for you!'

She wrought upon herself such a vivid impression that the voluntary surrender of her wealth was near and actual, that, when she reached home, she sat down by her drawing-room fire and considered the details: her father must be removed from his present retreat—her heart sank a little—and she must give up her pleasant home. In short, as the details rose before her, the surrender, though sweet and ungrudged, was painful. Was that strange? She was a good, generous girl, but she was quite human; and she had enjoyed the advantages of wealth for so short a time, that its novelty and attractiveness had not worn off. It is easy to commend the simple joys of hard work and contented poverty; and the wealthy man or woman who has worn himself or herself out with the cares of this world and wearied his or her appetites with their indulgence, may think with longing of rest from care in a little cosy parlour with a supper of bread and cheese. It is even easy to endure poverty with cheerfulness when you have never known aught else. But when you have known hard, thankless work, and eaten of poverty till its grit has set your teeth on edge, and then have passed away from them both—why, then it is a very painful prospect to surrender leisure and wealth when you have but tasted how sweet they are—how 'good for food,' how 'pleasant to the eyes,' and how much 'to be desired to make one wise.'

She looked round the room in which she sat. She liked it: it was comfortable, luxurious, and rich; it pleased her eye and her artistic taste, and it satisfied her fancy. She had got it all together herself; there was not a thing around her that she had not taken pains to choose, to discover, and to acquire. Everything—even the cushion against which her back rested—had a little history of its own. Must she give all these little things up, which had become like outlying fringes, tassels, and ornaments of her life? And these curious ornaments of rare Indian and Chinese workmanship in gold and gems which belonged to Uncle Harry, and which now adorned her neck and arms—must they be surrendered?

Was it strange that the expectation of losing all these things should cause her a pang? Was it not, indeed, right that it should, and yet that she should not hesitate, even in thought, in her intention of surrendering them? She said to herself steadily, 'They must go!' not once did she murmur, 'Can I not keep them?' The passion of sacrifice was upon her, and its pain only made it the more worthy and pleasing. At the same time its pleasure was enhanced by the thought that if she were once stripped of her wealth, Alan Ainsworth would cease to hold aloof from her, as he had persistently done of late—he had even excused himself from attending her uncle's House of Commons function, though she

had herself asked him—and might come to her with the magic glow of love on his cheek, take her hand and say, 'I need you now!'

She went and sat down at her writing-table, and moved by this ferment of thought and feeling, took from a drawer that journal of her uncle's which was his last bequest, and in which she frequently read. She opened the book at random now and prepared to read. But she paused, with her finger in the place, and thought how strange are the turns of circumstance, how unaccountable that element of surprise in life which men call 'The Irony of Fate!' Why, for instance, should it have so fallen out, first, that Uncle Harry's wealth should have come to her, and then that she should have to give it up after a few months' possession?

Thinking thus, she happened to fling the board of the book back to open it again. The board thus flung aside showed something she had never noticed before: that upon its inner side was a flap or pocket. She thrust in thumb and finger, and, to her surprise, drew out a sheet of note-paper—a few sentences of a letter which Uncle Harry had begun and addressed to herself. She read all the sentences again and again, but these stuck to her memory: 'It would please me much, if you can see your way, that you should marry George, as he and his father desire. He is a worthy young man, but obstinate and over-confident, and there is no woman can help him and guide him better than you.'

Coming at that juncture, the words struck Isabel strangely and solemnly—almost like a message from the tomb.

OCEAN CURRENTS.

OCEAN Currents exercise a very important influence not only on climate but also on commerce. The seas join the nations they divide, and the sailing-ship navigator's principal aim when remote from the land is to proceed along that much-desired track where a fair wind and a favourable current will probably be experienced. Ancient mariners who shuddered at the stormy sea were in blissful ignorance of the continual interchange that is imperceptibly yet surely taking place between the ice-bearing waters of the inhospitable regions adjacent to either Pole and the warmer waters which sparkle beneath the life-giving rays of a vertical sun. Nevertheless, despite the fact that the compass needle was uncertain and the chronometer unknown, hardy pioneers, on an unknown sea stretching westward for many a weary league, were not slow to perceive the insidious circulation of those currents of old ocean which traverse the North Atlantic like rivers of varying breadth, depth, length, and velocity. Columbus described the equatorial drift from east to west, and hazarded a crude conjecture as to its origin. A light wrought-iron utensil had been discovered among the natives of Guadeloupe, and he inferred that perchance this ocean waif might be of European fashioning, and obtained from some abandoned ship which the westerly motion of the tropical sea-surface had brought in all her loneliness from the far-distant shores of the Iberian Peninsula. Washington Irving has appositely remarked that if Columbus had but

steered to the westward, his tiny caravel would have entered the relatively warm water of that storm-breeder the Gulf Stream, and thus have been gradually drifted to Florida, or even to the northward thereof. A Spanish Roman Catholic population, instead of a later arriving English Protestant one, would in that event have made a home in North America.

Since then, seeds from the West Indies, and portions of vessels wrecked on the west coast of Africa, are asserted to have found a final resting-place on the Norwegian coast after a devious drift around the North Atlantic. The United States Hydrographer, Commander Richardson Clover, United States Navy, recently received information from several sources that a floating island had been sighted at sea; and the track of this nautical novelty was clearly indicated on the North Atlantic Pilot Chart for last November. The British steamship *Blue Jacket*, Captain Freeman, on the 28th of July last year, when in 39° 42' N., 64° 20' W., passed a floating forest covering more than a quarter of an acre. This moving mass was visible for a distance of seven miles, and its topmost branches were not less than thirty feet above sea-level. It was sighted also from the Italian steamer *Letimbro* on the 8th of August, in 39° 26' N., 65° 0' W.; and again by Captain Burgess of the British steamship *Roman Prince*, on the 26th of August, in 41° 49' N., 57° 39' W.; and lastly, by Captain Morgan of the British steamer *Ebro*, in 45° 29' N., 42° 39' W.

Water covers about three-fourths of the earth's surface to an average depth of two or three miles, although only a comparatively insignificant fraction of this distance from the sea's surface to the bottom is affected by currents, which are almost solely due to the prevailing winds driving the uppermost layers of liquid before them. Nevertheless, the effects of evaporation, the difference of temperature and specific gravity, and our planet's rotation on its axis, must not be altogether ignored even though their influence be most minute. The wilful wind does not pass without friction over the water on which it rests, but impinges on the surface of the watery waste, and drives it onward as a drift-current. When land, or occasionally another current, is approached, the slowly moving surface-water is deflected along a line of least resistance, and a stream-current is brought into existence. Hence it follows that the configuration of a coast not infrequently determines the direction in which a stream-current shall proceed.

The movements of the sea's surface and the superincumbent air resemble each other in many particulars. Both are fluids subject to the action of gravity; both expand with heat and contract with cold. The warmer air and warmer water follow similar indirect courses from the equatorial regions towards the Poles, while at the same time cooler air and cooler water are proceeding from the polar regions in the direction of the equator. Neither the air nor the water, however, flows due north or due south; as the equatorial-seeking streams lag behind and deviate to the westward, while streams proceeding polewards increase their velocity and deviate to the eastward. The effect of the earth's deflecting force is made manifest in several other ways.

In the Atlantic, Pacific, and Indian Oceans, in

the torrid zones, a continuous movement of the surface-water takes place from east to west. The South Atlantic equatorial current divides into two at Cape St Roque, the north-east corner of Brazil, flows northwards, meets the waters impelled by the north-east trade-wind to the westward, enters the Caribbean Sea, passes round the Gulf of Mexico, and, as the Gulf Stream, follows the trend of the east coast of North America as far as Newfoundland, whence it travels right across the North Atlantic in an easterly direction. The Gulf Stream, however, does not wash the American coast. A cold current comes creeping southward from Ballin Bay, and hugs the land closely even as far south as the orange groves of Florida. Some deny that the Gulf Stream actually extends from the New World to the Old; but their contention seems merely a matter of nomenclature, and it is perhaps preferable to abide by the time-tried theory until more definite information comes to the front. As the Gulf Stream nears Europe, it widens and becomes fan-shaped. The upper edge tends towards Norway; the central portion moves onward to the English Channel and the Bay of Biscay; while the southern edge flows, partly along the coasts of Portugal and Africa even to the equator, partly to the south-westward, past the Canary Islands and the Cape Verdes, reaching in course of time that portion of the equatorial drift due to the north-east trade-wind, and thus completing the circuit of the North Atlantic in a direction similar to the hands of a watch.

The current setting on to the coast of Portugal and into the Bay of Biscay is more especially to be dreaded when strong westerly winds have blown for several days in succession, and many terrible shipwrecks have taken place in the vicinity under such conditions. Her Majesty's ship *Serpent* was totally lost near Cape Villano, Spain, on the 10th of November 1890, owing to this insidious set on to the land. All on board but three perished out of one hundred and seventy-six officers and men. Years ago, the Peninsular and Oriental Company gave definite instructions, compelling their commanders to give Cape Finisterre a wide berth by keeping well to the westward thereof; and the current is carefully laid down on every chart worthy of the name, yet several steamships of various lines have within the last two or three years met their fate on that coast while attempting to round the cape too closely in thick weather.

The Gulf Stream is essentially a warm-water current, and therefore of the greatest importance from a climatological point of view. It has a beneficial effect on the climate of our islands, and keeps open the harbours to the extreme north of Norway. Dundee whalers have reached the 74th parallel on the fourth meridian of east longitude; while at the same time less favoured ports of North America were closed by ice even as far south as the parallel of Bordeaux. Its course is marked out by a deep blue colour, and a well-defined ripple is plainly perceptible on the margin of the stream in fine weather. During the American Civil War, a blockade runner left Wilmington, North Carolina, one dirty night. Next morning a Federal cruiser caught sight of the law-breaker, and gave chase; but her captain providentially noticed the ripple, kept his ship

away into the favourable current, and gradually left his puzzled pursuer far astern.

Mr Everett Hayden, of the American Hydrographic Office, drew up a chart setting forth the wanderings of the schooner *W. L. White*, which was abandoned by her crew near Delaware Bay during the blizzard of the 13th of March 1888, and drifted ashore at Haskeir Island, Hebrides, on the 23d of January 1889. In this interval she traversed a distance of more than five thousand miles, and was reported by forty-five ships. The Gulf Stream brought her right across the Atlantic; and several similar instances might be quoted. Mr Paul Lange, of the Liverpool Amateur Photographic Association, when off the south of Iceland in July 1890, threw overboard a bottle containing a letter, which was returned to him some months later, having been picked up in a fjord of the Lofoden Islands. In six and a half months it had drifted eight hundred and ninety miles in a north-east direction. There is a rumour that a pair of oil-skin trousers picked up on the west coast of Greenland helped to determine Dr Nansen's route in his proposed Arctic expedition. This driftage is asserted to have come from the ill-fated *Jeannette*, abandoned in Behring Sea while under the command of the gullant De Long of the United States Navy, who lost his life with many of his officers and crew in an attempt to penetrate the icy fastnesses adjacent to the North Pole.

Between the equatorial current due to the north-east trade-wind and the similar current developed by the south-east trade-wind, there exists a complementary current setting from west to east. This unites with the current coming down the north-west coast of Africa, which is known as the Guinea Current. Captain A. Fry, in a lecture delivered at Liverpool some months since, gave an interesting example of this current, which indicates the importance to seafarers of an accurate knowledge of winds and currents. A captain took his ship to sea, intending to sail from one port on the west coast of Africa to another only nine miles distant. The land-breeze died away, but was not replaced by the expected sea-breeze. Down below the boundary-line of sea and sky receded the shore; and in a few hours great depth of water precluded any attempt at anchoring. She was swept along by the Guinea Current at the rate of five miles an hour, and after several days the land hove in sight near Badagry. Then Prince's Island was raised, and eventually Cape Lopez. She got the south-west monsoon; and proceeded along the equator, turning gradually to the northward and eastward, until the port was again reached from which she had sailed seven weeks previously. Owing to the adverse current, she actually traversed three thousand miles to no purpose.

In the South Atlantic, a current sets round the Cape of Good Hope in a westerly direction, gradually turns northward, and follows the west coast of Africa up to about the tenth parallel of south latitude, where it meets the Guinea Current proceeding in the opposite direction. The resulting body of water moves to the westward as the South Equatorial Current until the Brazilian coast is reached about Cape St Roque, where it divides into two portions.

One branch makes its way into the Caribbean Sea, the other moves down the east coast of South America; and after proceeding thus for some distance, sends off a stream to the eastward, forming in this way a complete whirl of waters, as in the North Atlantic, but in an opposite direction. The main current continues down the coast to Cape Horn, which it either goes round or mingles with the Antarctic current setting from Cape Horn to the Cape of Good Hope, which drifts huge masses of ice from the southern ice-barrier directly into the track of homeward-bound ships.

Last year, the icebergs in this part were both numerous and of exceptional magnitude. The first report was received from Captain E. H. Andrew, of the Aberdeen sailing-ship *Cromdale*, bound from Australia to London. On the 4th of April last year, a large iceberg was seen right ahead only just in time to clear it; and at daylight, an hour later, the whole horizon was found to be studded with enormous icebergs. The largest of them was one thousand feet high! The *Urania*, in about the same position, afterwards sailed one hundred and fifty miles along solid ice in which no opening could be perceived. Captain Hatfield of the *Gladys*, from Iquique to Hamburg, on the 4th of July, passed an ice island bearing traces of having at some time served as a refuge for a shipwrecked crew. A place of shelter appeared to have been formed in an icy cave, and five dead bodies of men lay near. This barque sailed for four successive days between icebergs, and fears for her safety precluded a closer search being made. No similarly prolific season for southern icebergs has been known since 1854.

An equatorial current about three thousand miles wide moves to the westward in the North Pacific. It forms two branches near Formosa; and one of them, called the Kuro Siwo, or Black Stream, keeps north-eastward until Japan is reached, and then proceeds due east for the coast of Oregon. Here it curves, follows the coast to the southward, eventually turns westward, and forms a South Equatorial Current like that of the Atlantic. In fact, the Kuro Siwo has many points of resemblance to the Gulf Stream. In the North Pacific, as in the North Atlantic, there is an equatorial counter-current about three hundred miles wide, setting east between the Northern and Southern Equatorial Currents. Attention was specially drawn to this fact by Captain J. McKirdy, R.N.R., who was wont to avail himself thereof, in order to shorten his eastern passage, while in command of a steamship in those waters. The warmer water of the Kuro Siwo penetrates the Arctic Ocean by way of Behring Strait. A cold south-seeking counter-current hugs the eastern shore of Asia after the manner of the Labrador Current, on the east coast of North America.

The circulation of the South Pacific follows the same laws as that of the South Atlantic. The water of high southern latitudes sweeps off the east up the west coast of South America some as north as Arica, where the configuration of the coast sends the stream westward. This herlonch Current is recognised by its low temperature of sixty degrees Fahrenheit in close apposition to the sea-surface temperatures of over

eighty degrees. Thence it proceeds westward, and apparently curves gradually south, south-east, east, north-east, and north, to complete the circulation, although the drift on the western side is not so marked as in the other oceans. Two good examples of the equatorial drift are afforded by ships left to their fate under its influence. The *Ada Iredale*, bound from Ardrossan to California, was abandoned about nineteen hundred miles east of the Marquesas, on the 15th of October 1876; and was picked up by the French cruiser *Seignelay*, on the 9th of June 1877, near Tahiti, after a westerly drift of nearly two thousand five hundred miles. South of Australia runs an easterly current, due to the prevalence of north-west and south-west winds.

North of the equator in the Indian Ocean there is not found any well-defined circulation of the sea surface-water, for the monsoons and fickle breezes produce currents of variable direction and strength. South of the equator, however, the whirl is somewhat similar to that of the South Atlantic, or the South Pacific. The south-east trade-wind drives the sea's surface to the westward in about 10° S.; until, near Madagascar, it trends southward. There it divides into an easterly branch, which closes the circuit by turning northward on the west coast of Australia until the equatorial current is reached; and a south-westerly branch well known to seamen as the Agulhas Current, a warm-water stream, in the vicinity of which great changes of sea-temperature are experienced and violent storms frequent.

In either hemisphere there is a marked tendency for interchange between cold polar waters and warmer equatorial waters. The discovery-ship *Fox* drifted eleven hundred and ninety-four miles down Baffin Bay in two hundred and ninety-two days. Sir Edward Parry in his attempted sledge-journey to the far north found his intentions frustrated by the fact that the ice on which he travelled moved bodily to the southward faster than progress could be made over it to the northward.

Towards the central part of the North Atlantic is an area of high barometric readings, light winds, and variable currents. Sargasso weed, the abode of myriads of small crustacea, is met with there, but not in such extraordinary quantities as some assert. Vessels abandoned there make very little headway in any given direction. The American schooners *Wyer G. Sargent* and *Fannie E. Wolston* were abandoned in a water-logged condition in about 35° N., 72° W., on the 10th of June 1891 and the 15th of October 1891 respectively. They drifted eastward merrily in the Gulf Stream; but somehow got into the centre of the North Atlantic whirl, and were quite recently reported as having been passed afloat, but breaking up. The danger to shipping from derelict vessels of this nature cannot be over-estimated.

Many other instances might be given of the long drifts of derelict ships and bottle-messengers; but sufficient has been written to illustrate the fact that ocean currents are more especially dependent on the action of the prevailing winds and the configuration of the coasts. An accurate knowledge of ocean currents when remote from the land is not so important to

steamship navigators as their brethren in sailing-ships, yet they may not be utterly neglected when safety and a quick passage are deemed above all things necessary.

JOHN UPCRAFT'S CRIME.

CHAPTER II.—THE SURPRISE.

THE first thought that came into Jessie's head was to call her father; but a moment's reflection convinced her that if her supposition proved correct—if the stranger at the gate was the hunted convict—he would show him no mercy. He would deliver him up to justice, or drive him back into the foggy marshlands whence he had come. It was even more probable, she thought, that he would forbid her to unbolt the door. It might be unnatural to think so meanly of her own father; but his attitude towards her—the suppression of facts, that so deeply concerned her, for his own selfish ends—justified her opinion of him. She was not surprised; his conduct had only confirmed her in her estimate of his egotistic nature. He had lacked the moral courage to apprise her of the trouble that had overtaken John Upcraft, lest by so doing he might jeopardise his own comfort! How could she hope to win his pity for the desolate or distressed?

While she still stood there, doubtful how to act, the knock was repeated. It was louder, and showed signs of impatience. Jess no longer hesitated; she unfastened the door and looked out. It was Jim. His face was wild with excitement, and he was splashed with mud up to the eyebrows. He stood in the white mist, which he seemed to be breathing, so cold was the night-air. The light from the kitchen fire caught him where he stood outside, and showed Jess his strange appearance.

'What's the matter?' Jess put her hand upon his arm as she spoke, drew him into the kitchen and closed the door. The boy snatched off his cap and thrust it into his pocket; then he knelt down before the welcome blaze to warm his fat red hands. As soon as he could recover enough breath to speak, which it took him some effort to accomplish, he gasped: 'I ain't pretending now, miss. I ain't a-playing at convicts. It's a real game, this is!'

For a moment, remembering what Jim's mother had told her, Jess feared that her promising pupil had gone out of his mind—that the sound of the signal-gun had done violence to his youthful understanding. She placed her hand upon his curly head, and stroking it soothingly, replied: 'Why, Jim, you must be dreaming! How could your mother trust you out of doors on such a foggy night?'

'Mother don't know. You'll not tell her, miss; will you? I hasn't been home yet. I've been out on the marshes, and—and I've found him!' While he spoke, the look of wild excitement came back into his face. This strange look, and the still stranger words, set Jessie's heart beating fast.

'What can the boy mean?'

'It's true, miss—true as I'm a-kneeling here. I've found him!' Jim reiterated. 'And if you don't believe it, why, come alonger me and see

for yourself! It ain't very far—down in the marshes—just beyond the fust gate. He's a-lying beside the dike—that's what he's a-doing—half in, half out. He's a-lying with his face to the ground. I spoke to him, but he wouldn't answer. Then I got a fright, thinking of a sudden like that he was dead. I ran away. And seeing the light in your window, I ran—I ran.—You won't tell mother, miss, will you?'

The girl made no answer. She stood looking down thoughtfully into the boy's face. Presently she spoke: 'Are you warm now, Jim?'

The boy nodded.

Jess looked still more thoughtful. 'Do you think, Jim,' said she, 'if I were to go with you, that you could find the spot where you saw this man?'

'The convict?' Jim nodded emphatically.

'You'll never speak—never breathe one word of this to any one; will you, Jim?' whispered the girl, looking anxiously over her shoulder towards the study door.

'No fear, miss! They'd tell mother.'

Jess made a sign to the boy to keep still beside the hearth; then she turned the handle of her father's study door and went in.

Mr Bryce sat reading in his armchair, under his shaded lamp. He was smoking his pipe in his comfortable way. There was not a line in his face that betrayed anxiety about his daughter's great trouble. The whole affair would appear to have gone from his thoughts.

'Mrs Gilkes's boy is here,' Jessie began.

'Well, what does he want?' said her father, with impatience, as he knocked the ashes out of his pipe.

'He has got lost in the fog,' said Jess, 'and he's frightened—afraid to go home alone.'

'You are not going to take him, are you?'

'Yes. Mrs Gilkes will be getting alarmed. Besides,' said Jess, 'it's long past the boy's bedtime; and if he hasn't caught a chill'—

'The young scamp!' said Mr Bryce. 'There—take him home. There's always something amiss. I shan't get my supper before midnight. I know what it will be!'

Jess did not stop to argue this point. She took a flask of brandy from her father's cupboard and hastened out of the room. Jim stood near the kitchen door, eager to start on the expedition.

Jess wrapped herself in a thick cloak, and drew the hood of it over her head; then she took down an old lantern that stood on the mantelpiece—this she lit at the kitchen fire. 'Now, show the way,' said she.

Jim raised the latch, and they went out together into the fog. A lazy wind still crept up from the river, chilly and damp, over the marshland that lay before them. There was an indescribable sense of glimmer in the dense mist, as it seemed to Jess, when she became accustomed to the darkness. It was like a ghostly dream of moonlight. Jim carried the lantern: it cast limited rays of light before them. Presently Jessie felt the boy's disengaged hand groping into her own. They went forward in silence. Jim never showed any sign of hesitation; he led the way across the high-road, and into a bypath at the edge of the dike. The stagnant water was lit up in flashes from the lantern as the boy swung it to and fro. Presently they came to

a white gate over the centre of a small arched bridge across the dike. Here Jim stopped. 'That's where I saw him,' he whispered, and Jess felt his hand tighten in hers.—'There!—t'other side of the ditch—down there!' He swung the lantern as he spoke to illuminate the spot indicated.

'Give me the light,' said the girl. She pushed open the gate, and went forward with the lantern raised above her head. Jim held back, seized with the old fright; but a word from Jess encouraged him, and he went over the bridge at her side. Suddenly she felt the clutch of his fingers on her arm; she looked round, and saw him pointing into the dike. Jess crept to the edge of the bank and looked down. The light from the lantern fell upon the prostrate figure of a man with his face to the ground, as Jess remembered the boy to have described him. His clothes were torn and slimy; so were his hands. Jess knelt down to lift his head. The boy had seized the lantern eagerly, for his curiosity had dissipated all fear. He directed the light upon the man's face.

He was a young man; and his face was possibly handsome; but the features were so plastered with mud that a real mask would scarcely have hidden them more effectually. Jess uttered a suppressed cry as she raised the head upon her arm. No wonder, thought the boy, for surely such a dirty face was enough to scare any one. Jim also observed, as the girl hastened to lift the brandy flask to the man's lips, that her hand shook.

There was an anxious pause. Jessie's look never went from the man's face while she did all in her power to revive him. He drew a deep breath at last, opened his eyes, and stared blinking at the lantern. Presently he raised his eyes to the girl's face: Jim had turned the light full upon it; and instantly the man gave a great start and tried to rise to his feet.

'John!' She held him to her in her strong young arms. In spite of the marsh mire with which he was bespattered from head to foot—in spite of the ragged prison garb in which he was clothed, Jessie knew him! It was John Upcraft. He had covered his haggard, grimy face with his hands, and the white mist was creeping between their faces, as if to hide him more completely from her eyes. But she knew him, and held him closer to her—closer still. It was for him that the signal-gun had been firing, for the man she loved! She took his hands caressingly in both her own to reassure him, and said: 'You didn't think that I had condemned you?'

He bent his head and made no answer.

Meanwhile Jim stood before them with open-mouthed astonishment, directing the light from one face to the other, as if trying to read in each a rational explanation.

Jess found a footing on the slippery bank, and helped Upcraft to rise. He shivered with the cold. The girl took her cloak from her shoulders and threw it over him. 'Look, John! Do you see that light across the marsh?' said she, supporting him with her arm.

'Yes. But you mustn't give me your wrap'—

'I'm warm enough,' she interposed. 'We are quite near home. The light comes from our cottage window.'

Her words seemed to give Upcraft strength. Jim went ahead with the lantern and held open the gate; and then they stepped forward, by the way they had come, along the edge of the dike. They made slow progress; for Upcraft nearly fell to the ground more than once from fatigue before they came out upon the high-road. They were presently entering at the side-gate, Upcraft still leaning upon Jessie's arm, when a shadow flitted across the kitchen window-blind. They all three came to a sudden stand-still. Jim looked up into Jessie's face with a sudden gasp, and then took to his heels, carrying the lantern away with him.

'Rest here a moment,' said Jess; and Upcraft sank down against the low wall. 'That boy will ruin everything if I don't catch him and bring him back.' Jess soon overtook him. 'Frightened at a shadow, Jim?' said she. 'For shame!'

'It's mother. And—and,' said Jim, catching his breath—'she's come n'ter me!'

'If it's your mother, Jim,' said the girl, 'you shall run home as fast as you like. But wait till I've made sure.'

Jim accepted this compromise, and they hastened back to Upcraft. She led him to an arbour at the end of the garden and then went indoors.

'Why, miss, how white you look! Has anything happened to my Jim?' Mrs Gilkes—for it was she who spoke—was laying supper in the kitchen. She looked eagerly at the girl for a reply.

Jess quickly reassured her. 'Jim is all right. You'll find him safe in bed—I hope,' said she, 'when you get home.'

Mrs Gilkes overwhelmed Jessie with expressions of gratitude. Mr Bryce's voice presently interrupted her.

'See what father wants,' said the girl.

The moment Mrs Gilkes's back was turned, Jess looked out at the kitchen door. Jim was waiting there impatiently.

'Run home!' said Jess.

Her next thought was to send Mrs Gilkes home too. There was no need to detain her; and as soon as Jess had given the boy time to get well on his road to Little Thurrock, she despatched his mother in the same direction.

It was their custom to take supper in the kitchen. There was no help for it; her father came and took his seat at the table, and for once his egotism did good service. He never glanced up from his plate to study his daughter's face. Had he done so, her look must have roused his suspicions. She made a great pretence at eating, but not one morsel passed her lips. She was thinking—thinking—until she could hardly refrain from blurting out the whole truth. How Upcraft must be suffering, exposed as he was to the damp, chilly night! The very sight of the kitchen fire was a torture to her while he was debarred from sharing its warmth and brightness with her.

If her father had actually known that Upcraft was shivering in the cold outside—if he had tacitly planned to increase Jessie's agony—he could hardly have behaved with greater cunning; so at least it seemed to her. He always was a slow eater, and his appetite seldom failed him. But to-night—as it appeared to Jess—he ate at

a snail's pace and with the appetite of a hungry huntsman! And then—when he at last put down his knife and fork—he drew his chair towards the kitchen fire and began slowly to fill his pipe. Surely some mischievous demon had whispered the suggestion into his ear to settle himself here instead of retiring into his own sanctum! it was such an unusual action on his part. Was it because she had made the kitchen fire look so bright? It was with no thought of him, but of another to-night, that Jess had stirred it into so cheerful a blaze.

Mr Bryce, while still occupied in loading his pipe, looked round abruptly at Jess, and said: 'Well—what has Upcraft got to say for himself?'

Jess caught her breath, as if she had received a stab. Her face had betrayed her, she thought. Her father had guessed what had happened. She could not speak; she could only stare at him in blank amazement.

'What's amiss now?—Keep your eyes to yourself!' cried Mr Bryce angrily. 'Haven't you read the man's letter yet?'

'John's letter? I—— No, father; not yet.'

'Make pipe-lights of 'em! That's the best thing you can do.—Come!' said he, pointing to his meerschau; 'don't you see I'm waiting for a light?'

She struck a match and handed it to him without a word.

And now, as it still seemed to Jess, her father smoked with more deliberation than he had even exhibited when plying his knife and fork. He smoked, and fell into meditation, and knocked the ashes out of his pipe, and smoked again, until her power of endurance was nearly spent. The clouds of tobacco-smoke that lingered over his head interminably contained the very essence of his tantalising mood.

Having at last finished his pipe, Mr Bryce began to show signs of drowsiness. He had a habit at times of falling asleep over the fire after his evening smoke. This prospect was more than the girl could bear. She began to make a great clatter with the supper plates, as she washed and stood them up in the rack. This noise had the desired effect; for her father presently rose from his chair and, gruffly bidding her 'good-night,' betook himself to bed.

Jess only waited to hear him close his door; in another minute she was at Upcraft's side. 'Did you think I had forgotten you, dear? You must be half dead with cold.' She led the way into the house.

When Upcraft had washed the mud from his hands and face—had exchanged his prison garments for a discarded suit of her father's—and had eaten and drunk of the best that Jessie could provide, he finally rose from his chair beside the fire and held out both his hands. 'Good-bye, Jess—good-bye!'

She looked up entreatingly. He was a handsome young fellow, with dark resolute eyes. He spoke with an earnest, appealing ring in his voice.

'Jess! if I don't get clear of this neighbourhood before daybreak, I shall be taken. Think what that means!'

A look of anguish crossed her face.

'You shall have tidings of me—I promise

that,' he went on.—'Don't be down-hearted, Jess. What is my trouble now—now that I know you never thought me guilty? I had begun to despair—to lose all courage—when no consoling word came from you. But I have something to live for now!'

Jess could not speak; she could only cling to him in her grief at the thought of parting. She realised what it meant—or at least what she dreaded it must mean. She might get tidings of him, though she scarcely knew how. But to-night they had met for the last time! Her brain reeled at the thought.

She sat shivering before the dead kitchen fire, half dazed, until the cold gray dawn was looking in. She stared about her, and gradually the whole scene of the night that was past rushed vividly back into her memory. She went to the window, and, drawing aside the curtain, peered eagerly out. John Upcraft was gone.

MOSES IN LITERATURE.

It has been said that the earliest historical allusion to moss in any writing is contained in that reference in the First Book of Kings to Solomon's botanical knowledge: 'And he spake of trees, from the cedar tree that is in Lebanon even unto the hyssop that springeth out of the wall;' where it is conjectured that hyssop signifies moss. Pliny the younger in his book on Plants writes on the subject of mosses, and one moss he singles out, and gives it a name, the *Polytrichum*, which, from its golden-haired calyptra, he called maiden-hair; and this name he tells us it bears 'because it tinges the 'air, and is for this purpose boiled in wine with parsley-seed and plenty of oil, which renders the hair thick and curling, and keeps it from falling. It is always green, but never flowers. It delights in dry places, and is green in summer, but withers not in winter.'

Cowley refers to this little plant, and extols its virtues in one of his poems:

I being the chief of all the hairy state,
Me they have chosen for their advocate
To speak on their behalf. Now we, you know,
Among the other plants make no small show;
And fern, too, far and near which does preside
O'er the wild fields, is to our kind allied.

And so the poet goes on, crowding a very quaint and singular poem with the conceits for which he and most of the poets of his time were famous.

John Gerarde, in his *Herball*, on the subject of mosses, says: 'There be divers kinds of mosses, and those differing for the most part in their native places; some grow and are fastened to trees; others spring from the superficial or uppermost part of the earth; there be others also that grow in the sea.' And then he goes on to describe very learnedly and with much delicate discrimination the various kinds of mosses.

In his strange treatise called *Sylva Sylvarum*, Bacon writes concerning moss: 'It is true that moss is but the rudiment of a plant, and, as it were, the mould of earth or bark. Moss groweth chiefly upon ridges of houses tiled or thatched, and upon the crests of walls. And that moss is

of a lightsome and pleasant green. The growing upon slopes is caused, for that moss, as on the one side it cometh of moisture and water, so on the other side the water must but slide and not stand or pool. And the growing upon tiles or walls is caused, for that those dried earths, having not moisture sufficient to put forth a plant, do practise germination by putting forth moss.' He gives many interesting facts relating to mosses, which, however, we cannot here transcribe.

Our object in this paper is not scientific; it is not to trace the history and classification of mosses, or to point out the different species of the plant, their structure and characteristics; but it is a much simpler and more agreeable one, namely, to show how frequently they are referred to in our best literature, and what loving treatment they receive at the hands of some of our greatest writers of prose and poetry. It is only rarely that mosses are mentioned in literature by name. The famous African traveller, Mungo Park, will always be associated with the *Fissidens Bryoides*. He was five hundred miles from any European settlement, in the midst of savages, plundered of his clothes, hungry and depressed in spirits, but the sight of this little moss in flower cheered his heart and inspired him with new courage.

Our greatest living prose writer has abundant references to moss. In the *Lamps of Architecture*, Mr Ruskin writes of the 'company of joyful flowers' in the Jura, 'all showered amidst the golden softness of deep, warm, amber-coloured moss.' In the *Notes on the Turin Collection*, the 'moss arabesques of violet and silver' are among the 'wonders of the real Swiss foreground.' In *Modern Painters* we have quite a detailed description of mosses: 'On the broken rocks of the foreground in the crystalline groups, the mosses seem to set themselves consentfully and deliberately to the task of producing the most exquisite harmonies of colour in their power. They will not conceal the form of the rock, but will gather over it in little brown bosses, like small cushions of velvet made of mixed threads of dark ruby silk and gold, rounded over more subdued films of white and gray, with lightly crisped and curled edges, like hoar-frost on fallen leaves, and minute clusters of upright orange stalks with pointed cups and fibres of deep green and gold, and faint purple passing into black, all woven together, and following with unimaginable fineness of gentle growth the undulation of the stone they cherish, until it is charged with colour so that it can receive no more; and instead of looking rugged, or cold, or stern, as anything that is a rock is held to be at heart, it seems to be clothed with a soft dark leopard skin, embroidered with arabesque of purple and silver.' In another place this wonderful word-painter endows with a kind of moral influence or instinct the mosses and hepaticæ which we meet in our daily walks, representing them as 'full of pity, covering the scarred ruin and the old wall with a strange and tender honour.'

Tennyson is also very happy in his allusions to this subject. His mosses, it has been remarked, always give the very image that is needed. He begins his *Mariana* with the lines:

With blackest moss the flower-pots
Were thick encrusted one and all—

an image which at once sets before us the neglect of the garden which surrounded the disconsolate lady in 'the moated grange.' Again, he says in the same poem:

About a stonecast from the wall
A sluice with blackened waters slept,
And o'er it many, round and small,
The clustered marsh-mosses crept.

The same faculty which enabled him to draw such subtle subjective pictures of womanhood as Adeline, Isabel, and Eleanor, enabled him to see, and therefore simply to describe, in one of the most distinctive of his earlier poems, how

The creeping mosses and clambering weeds,
And the willow branches hoar and dank,
And the wavy swell of the sighing reeds,
And the wave-worn horns of the echoing bank,
And the silvery marsh flowers that throng
The desolate creeks and pools among,
Were flooded over with eddying song.

Nothing could be so soft as 'the cool mosses deep,' in which, as on a couch, 'the mild-eyed, melancholy lotos-eaters' dreamed away the happy hours:

Here are cool mosses deep
And through the moss the ivies creep,
And in the stream the long-leaved flowers weep,
And from the craggy ledge the poppy hangs in sleep.

Keats in like manner conveys the idea of repose by the use of the word moss. In his *Ode to Psyche* appears the exquisite stanza:

Yes, I will be thy priest, and build a fane
In some untrodden region of my mind,
Where branched thoughts, new-grown with pleasant
pain,
Instead of pines shall murmur in the wind;
Far, far around shall those dark clustered trees
Fledge the wild-ridged mountains steep by steep;
And there by zephyrs, streams, and birds, and bees,
The moss-lain Dryads shall be lulled to sleep.

In his *Endymion* he shows us the 'enmossed realms' of Pan, and 'little caves' wreathed

So thick with leaves and mosses that they seemed
Like honeycombs of green.

And again:

A jasmine bower, all bestrown
With golden moss.

He carries us along 'winding mossy ways' to see the 'violets bind the moss in leafy nets,' and says:

Freckled nest-eggs thou shalt see
Hatching in the hawthorn tree,
When the hen-bird's wing doth rest
Quiet in her mossy nest.

Shelley tells us that the streams and rivulets

Between the close moss, violet interwoven,
Have made their paths of melody.

In the garden where grew his 'sensitive plant,' there were 'sinuous paths of lawn and of moss.' And there, too,

The rose-leaves, like flakes of crimson snow
Paved the turf, and the moss below.

From the pages of Wordsworth we may glean a whole literature of mosses. He is the poet of Nature; and the little things as well as the great—we may almost say the little things more than the

great—are glorified by his genius. In his poem of *The Thorn* we meet with the following description :

And close beside this aged thorn
There is a fresh and lovely sight,
A beauteous heap, a hill of moss
Just half a foot in height.
All lovely colours there you see,
All colours that were ever seen ;
And mossy network, too, is there,
As if by hand of lady fair
The work had woven been ;
And cups the darlings of the eye,
So deep is their vermilion dye.

Writing of the little mountain-flower called the Alpine Catchfly, he says :

There cleaving to the ground it lies,
With multitude of purple eyes,
Spangling a cushion green like moss.

How exquisitely he sings of 'mossy stones' in his poem of *Nutting* :

I saw the sparkling foam,
And with my cheek on one of those green stones
That, fleeced with moss, beneath the shady trees,
Lay round me, scattered like a flock of sheep,
I heard the murmur, and the murmuring sound,
In that sweet mood when pleasure loves to pay
Tribute to ease.

Amongst the mountains and lakes of Cumberland and Westmorland, where Wordsworth's inspiration was quickened and purified, his neighbour, Hartley Coleridge, observed and studied the mosses with the eye of a friend and lover. When in the town he yearns 'for the brook with moss-girt fountain welling.' Moss in winter seems to have a special charm for him, and he is even jealous lest the spring flowers should supersede it in the love and admiration of any. With a kind of impatient regret, he says :

Now the old trees are striving to be young,
And the gay mosses of the Christmas days
To the fresh primrose must forego their praise.

And again he writes of winter mosses :

Though night and winter are two gloomy things,
Yet night has stars, and winter has the moss,
And the wee pearly goblets that emboss
The lumbering wall on which the redbr. ast sings,

The chalice mosses and the velvet green
That clothe November with a seemly dress,
As furry spoils that warm the red-haired Russ
Shield not the poor from blasts unpitoeous.

Childe Harold carries us back to the days when woods were haunted and every streamlet had its myth. In describing the fountain of Egeria, Byron says :

The mosses of thy fountain still are sprinkled
With thine Elysian water-drops : the face
Of thy cave-guarded spring, with years uncrinkled,
Reflects the meek-eyed genius of the place,
Whose green wild margin now no more erase
Art's works.

Hood's midsummer fairies

Enrich gray stems with twined
And vagrant ivy ; or rich moss, whose brown
Burns into gold as the warm sun goes down.

In a charming volume of Essays, now almost forgotten in favour of newer though by no means fresher books, Alexander Smith says in his description of Dreamthorp : 'Never was velvet

on a monarch's robe so gorgeous as the green mosses that beruff the roofs of farm and cottage when the sunbeam slants on them and goes.' Again he says : 'Every fissure has its mossy cushion, and the old blocks themselves are washed by the loveliest gray-green lichens in the world, and the large loose stones lying on the ground have gathered to themselves the peacefulest mossy coverings.'

Eugénie de Guérin as she moved about over the plains of Languedoc longed to know botany, that she might enter more closely into 'the herbs, the flowers, and the mosses that she knew by name.'

Caroline Southey in portraying the occupations and pleasures of English country-life describes a

Rustic rough-hewn bridge,
All bright with mosses and green ivy-wreaths.

And she tells us of a shallow, sparkling stream, a favourite fishing-haunt of her father's,

Where the green moss
Sloped down to meet the clear reflected wave,
That lipped its emerald bank with seeming show
Of gentle dalliance.

Mrs Browning alludes to the softness of the plant when she says in *The Lost Bower* :

As I entered, mosses hushing
Stole all noises from my foot.

Milton rests Adam and Eve on a 'mossy seat ;' and makes the lady in *Comus*

Awake the courteous echo
To give me answer from her mossy couch ;

while for himself he prays :

And may at last my weary age
Find out the peaceful hermitage,
The hairy gown and mossy cell,
Where I may sit and rightly spell
Of every star that heaven doth shew,
And every herb that sips the dew,
Till old experience do attain
To something like prophetic strain.

A contemporary of Milton, Francis Quarles, has the following quaint image :

And stormy blasts have forced the quaking trees
To wrap their trembling limbs in suits of mossy frieze.

Spenser often uses imagery derived from moss ; but his moss is often nothing but lichen, as on the 'two goodly trees . . . with gray moss overcast ;' but in the lines,

As hoary frost with spangles doth attire
The mossy branches of an oak half dead,

he seems to call it by its right name.

Cowley speaks of 'the mossy brooks and springs, and all inferior beauteous things.' And Dryden reminds us of the uses to which moss was put by our forefathers :

Houses then were caves, or homely sheds,
With twining osiers fenced, and moss their beds.

In the lovely lament over Fidele's grave, Shakespeare says :

With fairest flowers
While summer lasts, and I live here, Fidele,
I'll sweeten thy sad grave : thou shalt not lack
The flower, that's like thy face, pale primrose : nor
The azure harebell, like thy veins : no, nor
The leaf of eglantine, whom not to slander,

Out-sweetened not thy breath : the ruddock would,
With charitable bill

bring thee all this;
Yea, and furred moss besides, when flowers are none,
To winter-ground thy corse.

And in connection with this allusion we are reminded of Collins's lovely *Dirge in Cymbeline*, which has the verse :

The redbreast oft, at evening hours,
Shall kindly lend his little aid,
With hoary moss and gathered flowers,
To deck the ground where thou art laid.

From all that has been here said, it will be seen that moss, insignificant as it may seem to ordinary people, has occupied no little space in the pages of literature.

UNDER THE CHERRY-TREE.

THE STORY OF A SUMMER DAY.

By DOROTHEA GERARD.

IN TWO PARTS.—PART I.

'THIS is what I call something like a decent cherry year!' soliloquised old Mother Resi while she busily tied up the groaning branches. 'It's ten summers and more since I have seen them so big and red and juicy. We shall have full baskets, I warrant; and full baskets for the like of us means full pockets. Gracious! where should I be without my cherry-tree! Not its equal to be seen for miles around.—But, bless me, is this a visitor for me?' And shading her eyes with her hand, Mother Resi gazed along the glaring high-road which climbed its way towards the little Tyrolese village, in the neighbourhood of which is laid the story of this particular summer day.

A white sun umbrella was rapidly approaching; and presently, from beneath its shade, there emerged a spruce, muslin-aproned young person, who, her eye being caught by the red gleam of the cherries, came to an abrupt stand-still. 'Good-day to you. Are these cherries yours?'

'Yes, they are mine.—Your question warrants you new in these parts. Every child hereabout knows my cherries.'

'Why, then, you must be Mother Resi.—Now listen, Mother Resi. I am Frau Netti, the wife of the confectioner in the town, and I have walked out through a mile of dust to taste these renowned cherries. Let's see if they are as good as their name.'

With every cherry that she critically swallowed, the features of the confectioner's wife softened. 'What perfume! what aroma!' she murmured, well-nigh ecstatically. 'The very thing for my *compotes*.'

'How many pounds can I serve you with?'

'No pounds, my good woman—trees, if you had them; but, as it is, this one treeful will have to do. I will pay market price.'

'But I am a poor widow, a very poor widow indeed.'

'Well, well; let's say two kreuzers beyond market price.'

'Fairly spoken, Frau Netti. Gracious! where

should I be without my cherry-tree!—Now, let those rascals so much as squint at the fruit, if they dare!'

Frau Netti inquired whether there were thieves in the village; upon which Mother Resi plaintively explained that everything between five and fifteen was a thief—that every boy in the place had his fingers itching and his mouth watering after her cherries, and that—taking up the corner of her apron—they had robbed her summer after summer, poor widow as she was, with nothing in the world but her cherry-tree and her Sepperl.

'Well, well,' broke in Frau Netti, who did not care for tears. 'No doubt it is very sad; but I must be gone. Mind you keep a careful watch on the cherries until they are gathered. Think of our bargain. I must have all, or I will have none.' And Frau Netti tripped off again, the way she had come, leaving Mother Resi in a state of blissful bewilderment. Two kreuzers beyond the market price! And all sold in a lump! No tiresome dragging to market, no danger of bruised fruit at the bottom of the baskets!

'I always said that all my luck was in my cherry-tree,' she chuckled, as she tied up the last branch. 'And now it's time to be stirring the mid-day soup. Sepperl must look after the cherries meanwhile; it's about all he's good for.—Where has the silly lad hidden himself? Sepperl! Sepp! Seppi!'

It was not until his name had been shouted out in several more varieties, that the long and lanky son and heir of the house slouched into sight, with his shirt sleeves rolled up to his elbows and a broom in his hand.

'Take time, take time. Is it me that's wanted?'

'Sure enough, for want of a better. Is it to sweep the cobwebs out of your silly pate that you're holding the broom?'

Sepperl looked sheepish. 'No; it was for the dust on the parlour floor, and I was thinking that as the neighbour's Mirzl said she would look in upon us this afternoon'—

'Everything else might go its own way, ha? Have you not managed to get that girl out of your head yet?'

It was with a very resounding sigh that Sepperl gave answer: 'I haven't tried.'

'Moonshine—nonsense! Now then, sit down here, you and your broom. Shut up your mouth and open your eyes. Do you see the cherries there?'

'I should think I do. They would make a fine cherry tart, and Mirzl dotes on cherry tart.'

'Cherry tart indeed! Bread, dry bread, that's all that grows on cherry-trees for the like of us; and we won't get even that much unless you sit still here till I'm back again, and never turn an eye from the cherries.'

'But Mirzl dotes on cherry tart.'

'Well, well, if you mind the cherries and keep the village rascals off with your broom, I'll bake you a cherry tart for your Mirzl, but a small one, for I am a poor widow.'

'Hurrah!' shouted Sepperl, left alone under the cherry-tree. 'Next week, Mirzl and I shall eat cherry-tart, and next year we shall dance at our own wedding.—Oho! you good-for-nothings!

Is it my cherry tart you'd be after? Wait a bit; I'll tell Mirzl!' and with his broom, Sepperl made a dash at a couple of school-boys with obviously questionable intentions. Returning somewhat heated to his post, he was astonished to perceive a fair-haired young lady in a fashionable cream-coloured dress—at least Sepperl concluded it must be fashionable since he had never before seen the like of it—approaching along the pathway on the other side. She walked slowly, with her eyes on the ground.

'But what can she be looking for?' reflected Sepperl. 'There are no cherries on the ground,' he remarked aloud as the cream-coloured dress drew near. 'It's higher up you must look; but if you touch them, I'll tell Mirzl.'

The young lady raised her head with a start. 'What is the man talking about? Cherries? Ah, I see. Make your mind easy, my good lad; it is not your cherries I am after, but my lost locket. I know I dropped it on this path.'

'Locket—locket? What's that?'

'A thing one wears round one's neck.'

'Aha, a sort of keepsake thing, I take it to be.'

'I missed it while I was walking over the meadow with my aunt, and ran back to look for it, but could find nothing. Next, I hurried after my aunt, and could not find her either; so here I am now without locket and without aunt, and with aching feet that refuse to carry me farther.'

'Come, come,' said Sepperl good-naturedly; 'very likely by this time your aunt has found your keepsake, and then you would have both back again.'

Sepperl, who had wished to say something especially comforting, was astonished to see the young lady turn pale. 'Good gracious! I had never thought of that! But it would be too terrible; it must be prevented.'

'What's terrible about it?'

'My good lad, it's a long story, and you would not understand. There is something inside that locket which my aunt must not on any account see. Oh, to think that while I am wasting my time here, it may be in her hands already! I must go on hunting—if only my feet did not ache quite so badly.—Listen, lad: are you inclined to earn a florin?'

'I should rather think I am. A florin will buy an apron for Mirzl at the fair.'

'Then go and look for my locket.—But run, run, before my aunt finds it.'

'Take time, take time,' said Sepperl, doubtfully scratching his head. 'It's all about the cherry tart, you see. Mother said I wasn't to turn an eye from the cherries.'

'If that is all, you can go with an easy mind; I shall watch your cherries meanwhile.' And quite regardless of her pearl-gray Swedish gloves, the young lady resolutely took the broom from the hands of the astonished Sepperl.

Sepperl still lingered and still scratched his head. 'But supposing she beats me'—

'I will give you two florins if you go this minute.'

'Hurrah! That will buy earrings as well as an apron.—I'm going, I'm going; but take time! And mind you watch the cherries, or else my back will be aching to-night. Don't forget that

the tree belongs to a poor widow, who else will have no bread for herself and her children, and no cherry tart for Mirzl and me. Think of that, and sweep the rascally village children off with the broom.'

'Yes, yes, yes! I promise everything; but only go.'

At last he was really gone; and pulling off her wide hat, the young lady looked round for a seat, and, finding no better, sat down, broom and all, in the shadow of the cherry-tree.

The pretty face wore an anxious frown, as it was easy to see, now that the jealous shade was removed; and in truth Countess Angélique Lilienburg had grounds for looking anxious, for she was in what is vulgarly termed a 'fix.' That lost locket, which ever since the last carnival she had clandestinely worn round her neck, contained the secret of her hero-worship. It was a foolish thing to do, and, above all, a thing not at all up to date, for although hero-worship is likely to survive the nineteenth century, the fashion of wearing the hero's portrait in a locket, and, above all, of dropping it unawares, has long since given way to more practical contrivances. The only excuse that can be made for the sentimental foolishness of this young lady is that she had grown up within the walls of an ancient feudal castle, in the shadow of the blackest of pine forests, and under the care of the crossdest of old aunts, all of which elements—the aunt included—were wonderfully conducive to the growth of romantic sentiments.

'The very instant I have the locket again,' she now bitterly reflected, 'I shall certainly take out the picture and tear it to shreds, or else burn it to ashes—or else lock it away in a safer place.'

And then she fell to wondering whether he would ever come back from his travels, and where he was spending this day. Perhaps at the North Pole, perhaps at the equator. She hoped he had plenty of furs and a good sun umbrella; but she hoped it rather drowsily, for she had walked far and the day was hot.

'If only that lad would make haste! So it is to a poor widow that the tree belongs, and she looks to it for bread for herself and her children. I fancy he said something of the sort. Poor woman! How strange that there should be in the world people heartless enough to rob a breadless widow! I shall watch—her—cherries—very—faithfully.'

Countess Angélique was asleep in a bower of cherry branches, with her head against the tree stem, very much to the satisfaction of various small villagers of both sexes who had been on the watch for ten minutes at least.

Another ten minutes, this time of perfect enjoyment to the marauders, had passed, when they were scared off by the appearance of a tall gentleman, who with one hand was mopping his forehead and with the other vigorously using his hat as a fan.

'So I am not mistaken; it is a cherry-tree! As good as a dessert table spread for my own especial benefit; and a thirsty wayfarer will surely be absolved of his sins even if he swallow some half-dozen cherries, which, strictly speaking, belong more to his neighbour than to himself. Nectar and ambrosia! I must have some more!'

And, suiting the action to the word, the stranger gave a vigorous shake to the tree.

Among the patter of falling cherries, he seemed to hear something that was like a yawn, and a cream-coloured cloud moved in the shadow of the branches.

'Some one here?—Is it you, Countess Angélique?'

'Baron Blasewitz!' stammered Angélique, rising dazed from her mid-day siesta. 'How—where have you come from? I thought you were in Africa!'

'And I thought you were at Ostend.—But, pardon me, what can you be doing here? And with that broom?'

'I am guarding this cherry-tree; therefore, beware of my broom! You must know that the tree is the property of a poor widow, who together with her three little children—I think he mentioned three children—is reduced almost to starvation point. And imagine the base wickedness of the world, Baron Blasewitz—dishonest people prowl about and watch for the moment when they can pillage the branches unseen. Is it not incredible that such unscrupulous wretches should exist?'

'Quite incredible,' assented Baron Blasewitz, furtively wiping his mouth. He was not afraid of facing either lions or ice-bears; but the courage to proclaim himself one of the unscrupulous wretches afore mentioned failed him at this moment.

'And now that you know my business here, you might satisfy my curiosity by telling me what yours is.'

'Mine? It is nothing, really not worth mentioning; at least—that is to say.'—

'He is not shy usually,' reflected Angélique. 'I wonder what makes him so embarrassed all at once?'

'I saw this tree from afar, and as I noticed that it had such fine cher'—

'What?'

'Such a fine shade, I thought I would rest here a little while.'

Angélique thought she began to see clear. Her aunt was always talking about the flippancy and frivolity of this young man—supposing she should be right, after all. This spot under the cherry-tree was the very place for a rustic *rendez-vous*, and there were some very pretty peasant girls in the village—commonplace, of course, but that would not matter to a frivolous man. What treachery! And after all that had passed between them on that last carnival day! No wonder he was embarrassed.

'Well, there is the tree, Baron Blasewitz,' said Angélique aloud, in the iciest tones she could command, 'and there is the shade. I hope you have found what you looked for.'

'Oh, I have found far more than I ever would have ventured to look for! How could I guess what a treasure was hidden among these branches!'

'Baron Blasewitz!' stammered Angélique, stepping back.

'Your pardon, Countess Angélique; but the delight of this unlooked-for meeting has gone to my head.'

Angélique dropped her eyes and played with the handle of the broom. The chances were that

her aunt was quite right about the flippancy and the frivolity; and yet how his voice trembled, how earnest his eyes looked!

'Ever since last carnival I have carried your picture in my heart.'

'And I lie in my locket,' whispered Angélique to herself.

'My uncle sent me on my travels to amuse me; but it was no use. Give me but one word of hope, and no sacrifice will be too great to win you by, no labour too hard. All will go well, even if your aunt'—

'My aunt!' And with a start she seemed to come to her senses. 'If my aunt were to come upon us now! She never would believe that this meeting was a chance one.—Oh, Baron Blasewitz, leave me; I must go; my aunt may appear at any moment—I must go.'

'And the cherries? And the poor widow with the five children?'

'Good gracious, I had forgotten them! What shall I do? Ah—a happy thought: I resign my post to you.'

'To me?' almost gasped the Baron.

'Yes, precisely—to you. Why do you look so amazed? You talk of sacrifices and labours, and yet refuse the first trifle I ask of you.'

'For your sake, Angélique, I am capable even of guarding cherries. I accept the post; pray, hand me the bayonet—I mean the broom.'

'Here, take it quickly. Be watchful and wide-awake; I shall come again, but with my aunt.'

And in another minute the Baron was standing, broom in hand, alone under the cherry-tree.

'Thus far, therefore, has Love brought me,' he dreamily soliloquised—'even to a cherry warden. It is I who am responsible to her for these cherries. What bliss that she should deem me worthy of so much confidence! This broom which I received from her hands, how ravishing it appears to me! I could almost press it to my lips, if only it were somewhat less grimy.—Halloa! Here come the unscrupulous wretches at last. Let me show myself worthy of my post.' And half-a-dozen village urchins, with lips and fingers richly smeared with red, flew shrieking before the broom.

TOWARDS THE NORTH POLE.

A WONDROUS glamour veils the frozen sea
That guards the region of eternal snow;
A voice seems ever crying, soft and low,
'Come, sons of men, unlock the mystery,
And set the door of knowledge wide and free;'
And many hearing, may not choose but go:
The bones of brave men strow the way, they know,
Still forth they speed, to find the long-sought key.

Oh, gallant spirits! whom the Northern Pole
Draws, as a magnet, to the realms of night,
Where nature lies in desolation's blight—
Sail on, undaunted, to the distant goal,
For Fame's refulgent crown awaits the soul
That seeks death's gloom, to win the world more light.

Fifth Series

ESTABLISHED BY WILLIAM AND ROBERT CHAMBERS, 1832

No. 498.—Vol. X.

SATURDAY, JULY 15, 1893.

PRICE 1½d.

CROMER CRABS AND THEIR COUSINS.

As Everton is noted for its toffee, Burton for its ale, Melton-Mowbray for its pork pies, and Yarmouth for its bloaters, so Cromer, on the coast of Norfolk, is renowned for its crabs. Other places, to the right and left, have a share in reaping the crustacean harvest on the North Norfolk coast; but they do not give their names to their spoil; the crabs which their fishermen catch are 'Cromer Crabs.' The fishing-ground is a rocky area extending for twenty miles along the coast, and for about four miles out from the shore. There are eight miles of it to the west of Cromer, and twelve to the east.

Both the crabs and their cousins the lobsters are caught by means of traps called 'pots,' familiar objects to visitors at those seaside resorts, where this branch of fishing is pursued. These pots are quite a modern invention, having been introduced between twenty and thirty years ago. Before that time, hoops were used, weighted with lead, and with a net stretched beneath, into which fell any crab or lobster engaged with the bait when the hoop was hauled up. The work was very laborious, for, as long as the tide served, the hoops had to be continually examined. As soon as the last of the series had been raised, back the men went to the first. When the tide ran too strongly for the hoops to be worked, they were brought ashore. As they did not imprison the fish, it was useless to leave them in the sea.

The traps of to-day are one foot nine inches long, by one foot three inches wide at the bottom, which is a frame of heavy iron bars supporting bows of wood, over which is stretched thick string netting of home manufacture. A funnel-shaped aperture in each side conducts the crab or the lobster to the interior of the cage, while a side-door, which can be easily let down, provides for the withdrawal of the captives. The pots run away with a considerable portion of their owners' hard earnings. They cost about six shillings each by the time they are fitted up; the netting has to be renewed every year, and not a few are

carried off or cut adrift by passing ships. The Cromer men are more liable to this misfortune than their neighbours at Sheringham, as their ground is more in the track of vessels. Occasionally lines which have been cut by ships and steamers are seen at low tides, and the pots to which they are attached are recovered; but in spite of this, many lose from twelve to twenty pots in a single season.

The men work in couples, and the two partners will own between them from sixty to eighty pots. These are taken out to sea a few at a time, and unless damaged, are not again brought to shore until the end of the season. To each pot is attached a stout line ten fathoms (sixty feet) in length, and to this line are affixed a number of cork-floats, looking like so many dirty ship biscuits. On the float nearest the free end of the line are cut the initial letters of the owner's name.

The pots are not sunk close together, but are separated by a considerable space, so that ships may have a chance of passing between the floating lines. To an ignorant landsman, it would seem a matter of great difficulty for the fishermen to recognise the spot where their pots were deposited, and to single out their own property from that of their neighbours; for, in the height of the fishing season, the surface of the water is so dotted with floats that sufficient room for additional pots can scarcely be found. The task, however, is less like that of looking for a needle in a bottle of hay, than the uninitiated would imagine. By carefully noting, when the pots are laid, the relative position of prominent landmarks, the men are able to find their own lines with comparative ease. The pots can be examined only during slack tides, because when the water is high the floats are covered and out of sight.

While in some respects lobsters and crabs are identical in their habits and manners, there are other points in which they greatly differ, and these have to be regarded by their would-be captors. As is not unfrequently the case with relatives, it is better that they should dwell apart,

and, as a rule, this fact is recognised by them, the lobsters keeping near the shore, while the crabs are mostly met with farther out. A crab which ventures within reach of a lobster does so at the peril of his life. If seized by his aristocratic cousin, he will assuredly be killed by him, and not only killed, but eaten. No crab is allowed to enter a pot into which a lobster has made its way; and if one should be there when the lobster arrives, there will soon be nothing left of him but the shell. These empty shells are sometimes all that remain to tell the fishermen what they might have had if their visit had been more fortunately timed.

The lobster is much more agile than the crab, and having eaten whatever food he can find within a pot, clambers about the netting until he discovers one of the ever-open apertures in the sides, and then he passes once more into freedom. When fishing for lobsters, it is therefore necessary for the men to examine their pots as frequently as possible. Crabs, being slower in their movements, do not so readily escape, and an extra good haul is anticipated if the pots are unraised for a longer period than usual.

Lobsters are not only evilly disposed towards crabs, but, sad to say, they do not bear goodwill to one another. As soon as they are safely landed, their formidable nippers are encircled with a piece of string to prevent them mangling their neighbours. They are most pugnacious creatures. If two happen to meet in a confined space, they will at once 'make for' each other's eyes. In the words of an ancient mariner, 'they fight like men.'

Perhaps it is because crabs are less active than lobsters that the pots, into which it is hoped the former will crawl, must be moved to fresh ground every time they are examined, otherwise few or none will be caught. On the other hand, the pots for lobsters may be dropped on the very spot from which they were raised, without the subsequent catch being thereby lessened.

In the matter of food, our crustacean friends have dissimilar tastes, and this fact is manifested in the character of the bait used. The crab likes his meat to be quite fresh; while the lobster, in spite of the avidity with which, as we have seen, he will clean out the shell of a newly-killed crab, prefers flesh that is decidedly 'high.' Indeed, the staler it is, the more tempting it is to his appetite. The bait is placed between two leathern thongs, and is kept in its position by a sliding button. It formerly consisted mainly of portions of small flat fish, locally called 'butts,' which were sent in great quantities from Lynn and Yarmouth. These, however, are much less plentiful than they were, and therefore plaice, codlings, or any other fish that happen to be handy, are used.

Along the North Norfolk coast, large open boats, which carry a small, dark-coloured sail, are used in this fishery. They are much too heavy to be brought upon the beach, or even to be launched by the two men who form the little crew of each; but, by the men of several boats helping each other, the difficulty is easily overcome. Instead of the rowlocks being formed in

the usual way by the insertion of pegs in the gunwale, they are holes in the sides of the boat. These have the great advantage of preventing the oars being lifted out of their places by heavy seas, and also of affording convenient means of conveying the boat high and dry upon the beach. On the return to land, when the boat has grounded, oars are run through the rowlocks, and being grasped by men on either side, the vessel is carried to a spot where it will not be floated by the advancing waves.

The Cromer fishermen are not a numerous body; all told, they do not now number quite seventy, and are gradually becoming still fewer, for their sons do not, as a rule, take to the sea. Most of the Cromer men have therefore long passed the heyday of youth. The fishing population of the neighbouring village of Sheringham is more than four times that of Cromer, and is increasing, for it is the exception there for the boys of a fisherman's family not to follow their father's calling.

Crabs may be caught all the year round. There is no close-time, but the regular fishing season generally begins at the end of March, and lasts till September or October. Occasionally, it begins in February. The weather is the principal factor in determining when the pots shall be laid down and when they shall be removed.

Long before the end of the season, the pots become thickly covered with long weeds, through which imprisoned fish can with difficulty be seen. Vegetation also attaches itself to the lines, and makes them slippery. They have therefore to be brought ashore from time to time and cleaned. The professional way of doing this is to make the line into a coil, leaving two or three feet at one end free, and then, seizing the end, to repeatedly swing the whole overhead and forcibly dash it upon the wet sand, over which it is dragged by continuing the circular motion of the arm. When the line is judged to be sufficiently cleansed, it is hung up to dry, and at the end of a week is fit to replace another that has become too foul.

Lobsters are protected for a month—from June 25th to July 25th, the height of the hatching season. When the fishing for lobsters begins, they have just changed their shells, and are so hungry that more are then caught than at any other time of the year. As soon as they get firm and strong, they 'take the ground'—in other words, go into holes, and then the catches are smaller. Lobsters under eight inches in length may not be brought ashore. Those of the minimum size weigh half a pound, and usually leave this world from the supper and dining tables of the local hotels. At those establishments, lobsters weighing from one-half to three-quarters of a pound are greatly preferred to any others, and none scaling over a pound are willingly bought. The fishing-ground off Cromer produces plenty of lobsters reaching the respectable weight of three and four pounds, and some manage to escape capture until they weigh from five to six pounds. Very large fish cannot get into the pots, but reach the bait from the outside, and are hauled up while thus pleasantly engaged, or are caught on the hooks when the men are 'line-fishing.'

The protection of the law is to some extent thrown over crabs of tender age, for those which

are less than four and a quarter inches across may not be brought ashore. Those landed vary from half a pound to a pound and a half in weight; but the larger ones are not numerous, three-quarters of a pound being the average weight of the individuals sold in the course of the season. Crabs of this size are too small for the London markets, although they find a ready sale elsewhere. Cromer crabs are disposed of chiefly in Norwich and Yarmouth. They are sent thither alive. In cool weather they will live for three days after being drawn from the water; but in hot weather they do not survive twelve hours.

The number of crabs captured annually on the north coast of Norfolk is almost incredible. Mr Frank Buckland calculated that the fifty Cromer boats of his time would, even if the luck was bad, catch a thousand daily, which would give for the season a total of 158,000; while for a good season the captives would amount to 1,422,000. It is mainly the weather which makes a season good or bad. When the temperature is low, the creatures remain in their holes. Warm weather tempts them to wander abroad, and then it is the fishermen have a chance of entrapping them. In winter-time it is no unusual thing for good crabs and lobsters to be found on the beach after a gale. A rough sea 'scores' or destroys their beds, and some of the animals so disturbed get washed ashore. Many years ago, cartloads were picked up after one exceptionally heavy gale. The men feared that the ground had been depleted; but the following season was one of the best they ever had.

It is more than probable that a large buyer, ignorant of the peculiar arithmetic adopted by the captors of Cromer crabs when disposing of those dainties, would be somewhat surprised at the number he received in response to an order, say for a hundred. For some inscrutable reason, two crabs are counted as one, the two being called a 'cast,' and six score of these is called a hundred; so that the buyer of a Cromer hundred actually gets two hundred and forty. This strange method of computation is not followed in the case of lobsters; they are counted in the ordinary way.

Mr Frank Buckland's attention was officially directed to the fishery on account of its deterioration through the destruction of little crabs and of lobsters full of spawn. His Report resulted in the legislative enactments to which reference has been made. The Cromer fishermen, at any rate, would welcome the imposition of further restrictions. As the law at present stands, crabs which, by reason of their diminutive size, may not be sent to market, may be used as bait.

The Cromer men profess to release all the immature fish which they draw from the sea, and declare that any of their number who used little crabs for bait would suffer a greater loss of pots than could be attributed to the accidental cutting of the lines by passing vessels. Similar damage would befall any Sheringham man who ventured to try his luck on the Cromer ground. 'They have spoilt their own ground,' say the Cromer men; 'but they shan't spoil ours.'

When the crabs and lobsters have gone into their winter-quarters, then the herring-fishing begins. Terrible work this is, for the poor men have to remain at sea all night in their open boats.

Long-line fishing also is followed during the autumn and winter months. To each line are attached some eight hundred hooks, which are baited with mussels, an operation which occupies a good five hours, as the protecting shells of each mussel must be forced open before the fish within can be impaled.

But there are times when fishing is not the most profitable employment that can be pursued. Many of the Sheringham men have every year a spell of agricultural labour; while, during the height of the visitors' season, most of the Cromer fishers are engaged with the bathing-machines and pleasure-boats.

If the reader is a lover of lobsters, may it be his or her happy lot to visit Cromer when the fishermen are rejoicing in good luck, for then the price falls as low as sevenpence a pound; but even when the catches are not particularly good, the hawker's cry may be heard: 'Here's some rum uns; here's some big uns, all fresh boiled, and only sixpence each. Here's a treat this morning.'

THE BURDEN OF ISABEL.*

CHAP. XXX.—TANDERJEE RECEIVES A CHEQUE,
AND DANIEL FINDS A KEY.

GEORGE SUFFIELD was troubled by Isabel's letter, and by a gentle note from his father which he received about the same time—his father said he had heard disquieting rumours about cotton, but he would leave them to be talked over when he came down for Christmas, unless George thought there was anything of pressing importance to communicate—for they both had heard, 'on good authority'—matters, in fact, of which he had hoped that no one outside them suspected the existence. Yet it was characteristic of George that the fact of his proceedings being guessed at or suspected scarcely made him doubt the sufficiency of the means he had taken to keep them hid: it did little more than make him angry with the 'good authorities'—whoever they were—who had been so prying as to guess or suspect. So he merely wrote to his father that he had nothing disquieting to communicate; and then he wrote to Isabel with reassurance and fervour—and in the heat of the reassurance and fervour he went on in the course to which he was committed, and from which he saw neither reason nor necessity for departing.

For the cotton business was rapidly coming to a head—coming to such a head and gathering of offence as the trusting George did not suspect. All things seemed going well. Prices had gone up and down, just as Gorgonio and George had hoped they would. And that cargo of Indian—for which George had given Tanderjee an advance—had arrived, and had proved a conspicuous success. It had been of good quality, and had helped to raise the reputation of Indian in the market; and since there was the rumour of more of as good quality from the same quarter, it had sent down prices sufficiently to enable Gorgonio to make many more large purchases with the view to

cornering. And yet prices kept pretty much at a steady level in their careless way; for, though many believed that Gorgonio was trying to corner, no one believed that he could—that he had either money or experience enough—but especially not money enough—to carry him through.

George was thus in very hopeful mood when, one day early in December, Tanderjee came to him in the city office of the Suffields. He carried in his hand a roll of sample cotton, which, after a brief word of greeting, he opened out before George. 'It is good—is it not, Mr Suffiel?' he said. 'It is clean, soft, long. It is excellent cotton—think you not, sir?'

'It is very good, certainly,' said George, after examining it. 'Indian, I suppose?'

'It is Indian, of course, Mr Suffiel.'

'And you want me to do something with it, I suppose?'

'My people is very poor, and Mr Suffiel' is very rich: it is what the wise say—the rich man have the advantage. My people will gladly sell you at reduced price, on the old terms, as before, again.'

'How much is there?'

'There is sufficient, Mr Suffiel', to fill two steamer.'

'That is a great deal. I don't think I can do anything without consulting Mr Gorgonio: I must ask him how it would affect our other business.'

'That is all quite correct, Mr Suffiel'. Send for Mr Gorgonio at once: the telegraph will bring him.'

So George sent a telegram to Gorgonio, inviting him to come over at once from Liverpool on business, and Tanderjee departed for an hour or two. Gorgonio came with speed and a look of expectation, though he already knew all about the business, and had been waiting in his Liverpool office for the arrival of the summons. George set the matter before him, and he appeared to consider the carpet very deeply and closely. Then he raised his head and spoke. He begged Mr Suffiel' to observe that the business was like this: The cotton would in any case come to Liverpool; for their purpose they did not wish more cotton to come for some weeks; but cotton *would* come. What then? Was it not better that he should have the control of it from the beginning, than be compelled to reckon with it, deal with it, and perhaps fight with it when it came?

'Buy it, then, Mr Suffiel', said Gorgonio—'buy it, and let me receive it for you, and warehouse it, and sell it gradual, by parcels, at the top price.'

Finally, George agreed to that suggestion; and when Tanderjee came in to receive his answer, he said he would buy the cotton on the former terms, and that Tanderjee might tell the Bombay people to draw on him at once for three-fourths of the amount. But Tanderjee urged a further request, with a low bow and his hand on his heart.

'My people, Mr Suffiel', is very poor, and you are very rich; they have advise me that some money which they must pay me I will pay myself if I get the money from you. It will save the exchange from English into Indian, and from

Indian into English again, and it will be very much more convenient for me in time. So, Mr Suffiel', if you give me cheque now for them, I pay myself, and it is quite correct.'

The statement seemed obscure, but George thought it was probably all right, and that its obscurity was only due to Tanderjee's constrained English; moreover, he had done business a good many times with Tanderjee and had always found him straightforward and correct; and, therefore, being on the whole a simple, honourable, and kindly Englishman, he wrote out a cheque for seven thousand five hundred pounds, with which Tanderjee departed, leaving the air musical with his profuse thanks.

Next morning, Daniel Trichinopoly, while his master was occupied at the works, found he had business to do on his master's account in the town; and when in town, he called on Mr Tanderjee. Mr Tanderjee received him in his private office.

'You have come, my son,' said Mr Tanderjee in Daniel's native tongue. 'It is well, yea, twice well; for all is ready on my part. What of yours, my son? Do you in deed and in truth bring the plans in your bosom?'

'I have searched all places, and all drawers in the office and in the house of my master, O worshipper of the sun, but I have found nothing!'

'Ah, still nothing, my son! Still nothing, and nothing, and nothing!' said Mr Tanderjee, pacing up and down and waving his arms, while his spectacles gleamed with distraction. 'Is this, my son, the realm of Chola that we two dwell in, or is it the realm of deceit? You permitted the son of a dog and a pig, the Gorgonio, discover our secret of the plans, so that he has demanded his share of the reward! He has said, "The knife should be applied where there is flesh!" It is shameful to tell it, and painful to weep over it! And now—now!—there are no plans! And all things else are ready!' Tanderjee looked as if he could 'tear a cat' in his despair.

'There is still time, O worshipper of the sun,' said Daniel sweetly. 'It is impossible that we should go away until the Festival of Christmas is upon us. And there is still one place to search and examine; but it is difficult.'

'Oh, let not difficulty make your heart faint, O cunning one! For is not the way to wealth difficult, and the door-step to riches slippery? What is the one place still to search, my son?'

'It is the great box of iron that is called "Safe," that stands in the office like a shrine. No man, as I hear, has ever seen it open, and when my master opens it he locks the outer door. Methinks there dwells in it the demon or spirit that brings the Sahib Suffield and Sahib George their luck!'

'You are but a fool, my son Daniel. You have learned the religion of the English Sahibs as a deaf man listens to a song. You are still in the bonds of your native ignorance. The safe is but a strong box. See; I have one, and there is no demon in it.'

He opened the door of a very small safe let into the wall over the fireplace, and let Daniel look in. But Daniel seemed scarcely reassured.

'That box, O worshipper of the sun,' said he, 'is only a toy compared with the box I have

seen. And, moreover, how know I that a little demon does not dwell in your box when it is shut up for the night?

'The successful man knows no fear,' said Tanderjee. 'Be you successful, and you will laugh at the demons. The safe of Sahib George opens with a key, my son: where does the Sahib George keep that key?'

'It is that key, I believe, O worshipper of the sun, which the Sahib keeps in the pocket of his trouser, and fastened with a chain round his waist. Sahib George would defend that key with his life.'

'You must get possession of that key, my son.'

'I cannot do violence to my master,' answered Daniel. 'Moreover, if I offered violence to my master, which of us would prevail?'

'Your wits are becoming dull, O cunning one,' said Tanderjee. Then suddenly bethinking himself, and frowning, he stepped up to Daniel and shook all his fingers in his face. 'We dwell in deceit, my son! You hide your meaning under green leaves of stupidity! When the jackal becomes fat he can hunt no more: is it not so, my son? The English Sahib feeds the dog well, and it longs to dwell with him—is it not so?'

'Is it good to cut a man's throat after gaining his confidence?' said Daniel sulkily. 'Is it well to betray a man who has fed you with his bounty? The Sahib George has given me his confidence, the Sahib has fed me with his bounty: you may take the key of safe yourself, O worshipper of the sun: I will not!'

Daniel was turning to the door, but Tanderjee intercepted him. He shook his fingers in Daniel's face; he threatened; he cursed—in Tamil—and finally he whined, for Daniel stood calmly listening to all his moods.

'Why will you make me frantic, O cunning one?' said Tanderjee. 'You mean it but for a pleasantry—do you not?—that you may see I need you as much as the carpenter needs a saw. Think you the reward I have promised is not enough, O cunning one? Is it so?'

'If a man sells his honour for a Cash,' asked Daniel, 'can he buy it back for a Crore? I will sell my honour only for a Crore, O worshipper of the sun, so that I may have wherewithal to buy it back.'

'You are a hard bargain-driver, O cunning one,' said Tanderjee. 'But I will increase your reward to half of the money which I have received when you put into my hands the plans.'

'Copies of the plans, O worshipper of the sun.'

'Be it so—copies of the plans.'

Then it was arranged between them that Daniel should find means as speedily as possible to handle the key of the safe, and to take a wax impression of it, which he would give to Tanderjee, and that Tanderjee would thus get made a copy of the key, which he would give to Daniel. It was for some time a point of contention whether or not Daniel when he had discovered the plans should bring them to Tanderjee for aid in the copying; Tanderjee thought he must; but Daniel—clearly distrusting Tanderjee—thought he need not: he was clever enough to do the

copying himself in the place where he should find them.

It was now necessary for Daniel to tell first of all what key was the key of the safe. That very evening, when George sat alone at dinner, Daniel made an attempt.

'With regard, Mister George,' said he, with simple guile, 'may I be permit to ask the question: what you keep at the end of the chain which chain you like a prisoner?'

'A key, Daniel,' answered George carelessly.

'Nothing but a mere simple profane key, Mister George?' exclaimed Daniel. 'If I am not very troublesome to mention, the same time I must say it is singular and strange, etcetera, for a gentlemen to wear a key tied with a chain to the middle of his body. With regard—I beg to excuse, Mister George—why that key do not it hang on its respected nail like other key? But it would not be an astonishment to know that it is a pet key, a key of worship, a key of gold.'

'It is in a sense a key of gold,' laughed George, taking the bright little steel instrument from his pocket, 'for it is the key of the safe.'

'Ah,' said Daniel. 'The key of safe? And may I beg to know? "Safe" is called that great box of iron in the Sahib's office?'

'That's it,' said George, tired of the subject.

It was not difficult for Daniel—in spite of his contrary protestations to Tanderjee—to find an opportunity to hold the key a few minutes in his hand in the frequently recurring aid he gave to George in dressing or undressing; and when a copy of the key was made, it was not difficult for Daniel—not very difficult—to open the safe, and to search for the plans, in spite of the genius of the Suffields which resided there; and when the plans were at last found, it was not beyond the powers of Daniel—had he not been carefully taught reading, writing, ciphering, and drawing by good Englishmen?—to make excellent copies of them.

On the whole, then, there is no room for amazement that Christmas had not yet come, though it was at hand, when Daniel sent a note to Mr Tanderjee, containing these words only: 'All is ready. Prepare.'

THE TRANS-SIBERIAN RAILWAY.

THE great scheme of an iron band to connect the extreme eastern with the extreme western boundaries of the giant Empire of Russia is at last in process of being carried out. The Trans-Siberian Railway bids fair to become an accomplished fact before the British public realises that it has been begun—much less the possibilities which it enfolds. But when St Petersburg is joined by rail with Vladivostok, a new era in the intercourse between West and East will begin. Such a railway has long been the dream of Russians—certainly since the days of the Crimean War; and several years ago a Committee of Experts was appointed by the Czar to consider the various routes proposed, to decide upon the best, and to determine whether the line should be continuous from end to end, or only constructed to unite

the navigable rivers. In 1890 this Committee reported in favour of a continuous line, starting from Ufa, on the European side of the Ural Mountains—already connected by rail with Samara and the Volga Basin—and running through Slatoust, Tomsk, Krasnoïarsk, and Nijni Udinsk to Irkutsk, should thence be carried along the line of the Amur River to Vladivostok, the outermost outpost of Russia in the east, and her naval and commercial emporium in the Sea of Japan.

A glance at the map will show that by this selection of route the railway will skirt the northern frontiers of Mongolia, and thus have a chance of drawing traffic from the Chinese Empire—not to mention the strategic value in the event of possible quarrels with that rival Asiatic power. But there were other good reasons for the selection. For instance, the entire length between the two termini indicated is 4900 miles; but the Samara Railway has already been carried through Ufa and across the Ural Mountains to the gold-mining town of Miarsk, a distance of some one hundred and twenty miles. By so much, therefore, is the construction of the Trans-Siberian line shortened, although one hundred and twenty miles is but an insignificant proportion in nearly 5000. But, again, the first of the three sections into which the experts have divided the line, that from Slatoust to Tomsk, is through a flat country, in which construction will be easy, which is well peopled, and which, by a small branch, can draw considerable intermediate traffic from the region of the Altai, as well as secure the increasing traffic of the valleys of the Obi and the Irtysh. This section, indeed, will drain what many people regard as the future granary of the Old World. We are too much accustomed to think of Siberia as a barren, inhospitable region of frost and ferocity; but as a matter of fact there are three Siberias—frigid, temperate, and torrid. And the railway is designed for the most part to traverse the temperate and most productive belt.

The second section, between Tomsk and Irkutsk, has probably not much to expect from the products of the soil; but, on the other hand, this is, perhaps, the richest auriferous region of Siberia. The third section, from Irkutsk to Vladivostok, is the most difficult and expensive of all, having to run through a country very thinly populated, in parts, indeed, one might say uninhabited, with an inhospitable climate, and presenting many engineering difficulties. This will be the most costly part of the line, both to construct and to maintain.

It is proposed that there shall be stations every thirty miles or so along the whole line, and that the wider rivers shall not be bridged, but crossed by steam-ferries. The probable cost is variously estimated at from thirty-five to fifty-five million pounds; but judging by experience of the work so far, it is more than probable it will exceed the higher figure.

Some Russian critics have rather objected to a route having been chosen which for a considerable distance exposes the line to risk of damage by Manchurian bandits, if not of interference under the ægis of Chinese officials, who, as a class, are by no means yet favourably disposed to railways. But the advantages are held to outweigh the dangers; and, moreover, it is understood that Russian diplomats have arranged a satisfactory understanding with the authorities at Peking.

The Report of the Committee of Experts above referred to was in due time followed by the issue of an Imperial ukase ordering the construction of the railway. It is said that the Czar's advisers were much divided on the subject, owing to the immense sum of money involved, and that it was because of these differences of opinion that the Imperial order was not given until May 1891. One does not hear that any of the Czar's advisers pleaded for the expenditure of the money in a way much more calculated to improve the condition of the Russian peasantry—namely, by the extension of railway communication in European Russia. The matter was regarded as a military one, the opponents of the railway contending that the money could be better applied on fortifications and so forth; while the advocates of the railway contended that it would be more useful than fortifications, and certainly not less valuable in the defences of the Empire.

And here it should be mentioned that the idea of a railway across Siberia was first suggested by General Mouravieff, the governor of East Siberia during the Crimean War. It is, perhaps, not generally remembered now that one of the first operations of the allied forces was an attack upon the Russian outposts in the Pacific; and the narrow escape which Russia had on that occasion of being permanently shut off from the Eastern seas, led to a great development of her military arrangements in Siberia. It was then that the danger to which the Czar's Asiatic dominions are exposed by their separation from the base of supplies suggested a railway. Like the Trans-Caspian line—which, by the way, there is a plan to run northward to join the Trans-Siberian line at some future date—the Trans-Siberian railway is political and military in origin and design.

The line is being built from both ends, but most effort is in the meantime being directed to the eastern and most difficult section. About the middle of 1891 the first sod was cut at Vladivostok by the Czarewitch; and since then the work has been steadily prosecuted. For about two hundred and fifty miles from Vladivostok the line passes through what is styled the Ussuri section, being the country watered by the Ussuri branch of the Amur. This is an undeveloped region of great mineral wealth, but so diversified in its physical aspects as to provide many tough engineering problems. Wherever practicable, tunnelling is being avoided by detours, the engineers even preferring to build an embankment on which to carry the line round a hill than to cut through it. In the same way, a deep narrow inlet of the sea near Vladivostok is not being bridged, but the line is taken round it. One can under-

stand the avoidance of tunnels on the score of cost, but what saving can there be in the case of the bridge? None whatever, but the reverse—only military authorities declared the bridge too open to attack from a hostile fleet.

Some six thousand men, mainly Russian soldiers and Chinese labourers, are employed on the Ussuri section, which is expected to be open next year. It has cost, so far, about thirteen thousand pounds per mile, on which basis the entire railway would cost not thirty-five or fifty-five, but nearer sixty-five, millions sterling. But, as we have said, this eastern section is the most difficult, and will be the most expensive part of the work. On the other hand, it is to be remembered that the present railways in Russia have cost on the average about seventeen thousand pounds per mile, and that, although Siberia is exceptionally level, and is well supplied with timber, &c., yet the inhabited districts are widely separated, and climatic conditions must tend to serious interruptions of work. Of course the dispensing with bridges on some of the wide rivers may reduce the first cost; but this cannot be regarded as a permanent saving, as the bridges will sooner or later have to be supplied.

It is a mistake to suppose that Russia possesses great facilities for big undertakings in Asia in the way of free convict-labour. As a matter of fact, the convict problem is not less difficult in Siberia than in America, where, as has been seen, there are constant revolts against the employment of prison labour in competition with free labour. The introduction of convicts on to the works of the Trans-Siberian Railway led to complete disorganisation and frequent scenes of violence. Neither the Russian free labourers nor the soldiers would work along with them; and although, we believe, about a thousand convicts are still employed on the works, they are rather a source of trouble and anxiety than of profit to the Government.

From the western end, the Samara Railway is being actively pushed forward, and is expected to reach the Tobol River—on which is situated the city of Tobolsk—in the course of next year. From there it must reach Tomsk to complete the first section. It is a far cry from Tomsk to Irkutsk, while beyond Irkutsk the Ussuri section is but a small portion of the third great section. From Tomsk to Irkutsk is about eleven hundred miles; and from Irkutsk round the southern end of Lake Baikal, and by way of the Ussuri to Vladivostok, is about double the distance. At the present writing, there are about four thousand miles of railroad still to build. At the rate of progress of the last two years, the Trans-Siberian Railway will not be completed from end to end for other twelve years or so.

And then? Will it ever pay? That is not the question which troubles the Russian Government, any more than it affected the decision of the Czar when he applied the ruler to the map to show the route to be taken by the St Petersburg and Moscow Railway. But it must have some interesting results.

For instance, Vladivostok must become a great port; and already lines of steamers are being projected to run from there to America and Japan. In a recent Report to the Foreign Office on the trade of Corea, Consul Hillier refers

particularly to the future of Vladivostok. The port is already a place of great commercial importance, and its trade must be largely increased by the construction of the Trans-Siberian Railway. Apart from the actual and potential traffic in Siberia itself, Consul Hillier points out that most of the brick-tea, which at present finds its way overland via Tientsin, will be sent by steamer from Hankow to Vladivostok for distribution through Siberia by railway. The sparsely-inhabited districts of the country will be occupied and utilised as the line is opened up, and a great increase of traffic with Corea is predicted. For four months of the year Vladivostok is ice-buried; but notwithstanding that, the natural advantages of its position, with railway communication with the west, will make it one of the most important places in the Far East. It is already a great naval station, and is strongly fortified, and as the great stronghold of Russia in the East, it will be the centre of constantly-growing activity.

But what is not generally known is that within fifty or sixty miles of Vladivostok has been discovered, and is now being developed, a particularly rich vein of anthracite coal. At present, this coal is being worked by English machinery and Chinese labour, and is sent down by lighters to Vladivostok. But a short branch will be constructed to connect the mines with the Trans-Siberian Railway; and, moreover, the whole Ussuri country is believed to be full of coal-fields. Here, then, is a great prospective source of traffic in itself, not to mention the solution of the fuel problem for the locomotives, and for the Russian steamers in the Pacific.

The whole region of the Amur is known to be rich in minerals, and gold, silver, and platinum have for years been mined, under disadvantageous conditions which the railway will remove. So long ago as 1858, there was quite an acute gold-fever in Russia, and an extensive rush took place to the Amur diggings.

It is now five years since the first train entered Samarkand, nine hundred miles from the Caspian Sea. This was accounted a great enterprise; but both in extent and in cost it does not represent one-fifth part of what is involved in the Trans-Siberian Railway, which, roughly speaking, will be about double the length of even the great Central Pacific line of the United States.

It is not reasonable to expect any great revenue to the railway from any through-traffic with China. In a few words, this expectation can be disposed of. Thus, experience in other countries has proved that railway transport under the most favourable conditions cannot be carried on with profit at less than one halfpenny per ton per mile. Let us, for the sake of argument, take eight thousand miles as the distance between Vladivostok and London, and let us assume that tea or silk could be delivered at Vladivostok as cheaply as at Hankow or Shanghai. Yet the railway rate would be, in round numbers, about seventeen pounds per ton, as against about two pounds per ton by steamer. There is thus no possibility of competition.

So much, however, has been done by railways in the opening up of the American Continent, that great things may reasonably be expected in Asia, only the autocratic system of government

is not in favour of rapid industrial development. That Siberia is capable of becoming a highly-productive country there is abundant evidence, and within the last year or two several travellers have referred in sanguine terms to the very great agricultural resources of the southern belt of the country.

Besides the great potential wheat-growing area, Southern Siberia has large tracts of land which seem specially marked out for stock-raising, and Siberian ranches are amongst the possibilities of the future. The actual gifts of nature ready to be grasped are in the trackless forests, in the bosom of the earth, and in the wealth of fur and of fish, the realisable value of which depends on accessibility of markets. A very large quantity of grain is already grown in Siberia, but as no present means exist of sending it to market, it is mainly used for distilling alcohol.

A good deal of manufacturing goes on in Siberia, recent statistics showing there are upwards of two thousand factories, such as tanneries, tallow-factories, distilleries, &c., in the provinces of Tobolsk and Tomsk alone. Siberian manufactures are for the most part sold in Asia; but markets could be found for much more in America and Europe were the railway completed. The imports of manufactured goods—almost entirely from Russia—amount to about fifteen millions sterling per annum; and of course the more the country developed internally, the more would it require the manufactured products of Europe. We have seen it stated that at Yakutsk, sugar sometimes rises to two shillings and sixpence per pound, and that valuable furs are often to be had in exchange for a little whisky!

Eastern Siberia, which includes an area of about three million square miles, and a population of one million and a half or so, has been heretofore almost entirely dependent on China for cotton, woollen, and silk fabrics. Yet this is the great mineral area of Northern Asia, the California of Russia, yielding several millions' worth of gold every year.

Whether the great wheat-lands of Siberia can ever be utilised for the supply of hungry Britain is a problem for the future to solve. But looking at the immense distances over which grain is transported by rail in America, it is not unreasonable to look at Asiatic Russia as a probable source of food-supply.

That the line can flourish, or even pay the interest on cost of construction, from local and intermediate traffic, unless there be immense agricultural and industrial development, need not be expected. Roughly speaking, there is at present in Siberia only one person to each square mile of territory. Now, in the United Kingdom the average amount of traffic is equal to about eight tons per head of the population; and in Germany to three and three-quarter tons; but in European Russia to only half a ton. On the same basis, and for the population within reasonable reach of the area of the railway, the local traffic would not amount to a million tons per annum.

In conclusion, it may be said that the distance by rail from St Petersburg to Vladivostok is computed at about six thousand miles, and that the time required for traversing this distance by train will be about sixteen days. In something

like three weeks, then, one should be able by the Trans-Siberian Railway to run from London to Yokohama, and within a month be amid the antiquities of Peking, or amid the wilds of Kamchatka or Corea.

JOHN UPCRAFT'S CRIME.

CHAPTER III.—TIDINGS.

THREE years went by. It was winter again. The marshlands lay beneath a thick coating of ice; the dikes were frozen pathways to the Thames; the pollards had grown white-headed with rime; and the only signs of life were the gulls coming in from the sea with their plaintive cry for food and shelter.

It was holiday-time. Jess was still a teacher at the village school. But she no longer felt ready to dance home along her path; for the promise of tidings which Upcraft had given her had never come. The girl had lost all hope. And yet she went about her duties cheerfully; the old routine of village life continued to run its uneventful course; and it was seldom that any one—unless it were her little friend Jim—detected a line of care upon her face.

One dismal afternoon—Jess having gone to spend the day with friends at Thurrock Hall—Mrs Gilkes sat warming herself over the kitchen fire. Mr Bryce was having his after-dinner nap, the only time when the woman got any rest at the cottage. Jim knelt upon the hearth-rug at his mother's side, rubbing his fat hands together, just as he knelt and warmed them upon the night of his expedition with Jess across the marshlands three years ago. Suddenly he touched his mother's arm. 'There's the firing agin!' said he, his small keen eyes glittering with excitement. 'Don't you hear it, mother?'

'Never mind the firing, Jim; get to work!' said Mrs Gilkes. 'It makes me downright queer to look at you when the convicts is abroad. It's high time you was a-growing out of it, and now you've begun to earn your own living too.'

Jim was on the point of replying, and not without impudence, to judge from his look, when there came a loud knock at the front door. He hurried down the passage to answer it. On the doorstep, under the porch, stood a tall man in a great fur coat. There was just enough light left in the gathering mist to see his face. Jim stared at him for a moment, and then gasped, as though he had received an unexpected blow in the back.

'Is Miss Bryce at home?'

'No, sir!'

'Mr Bryce?'

'Yes; he is. What—what name?'

'Tell him,' said the visitor, 'that a gentleman has called to see him.'

Jim rapped at the study door, and receiving an order to 'come in,' instantly obeyed.

'What's it all about?'

Mr Bryce sat upright in his armchair and looked sternly over his shoulder at the boy. Jim delivered his message.

'Why don't you show him in?' said Mr Bryce.

'I'm a-doing of it, ain't I?' And Jim opened the study door to its full extent.

The visitor stepped in. Having closed the door behind him with a jerk, Jim groped his way back to the kitchen as though he had been struck blind.

'Bless the boy,' cried Mrs Gilkes, catching her son by the shoulder as he leaned against the wall, 'how pale he is!'

'No, I ain't!'

'You are, Jim. You're as pale as if you'd see'd a ghost! It's all alonger the firing. You're a-worriting your head agin about them convicts,' said Mrs Gilkes. 'It ain't no good a-contradicting me.'

Jim made no further attempt at contradiction. He thrust his hands into his trousers pockets and stared wonderingly into the fire.

Meanwhile, Mr Bryce, who had been startled out of his nap, could make nothing of the visitor in the uncertain light of the afternoon.

'What do you want with me?' said he gruffly.

'Nothing. I've come,' was the reply, 'to see your daughter.'

The man's voice, and the dim outline of his face and figure as he stood between him and the light, brought a sudden look of hatred and indignation. 'Upcraft! Why, you are surely mad!'

'I'm perfectly sane.—Are you expecting her home?'

Mr Bryce got up from his chair and stood upon the hearth-rug with his back to the fire. 'I am expecting her home. But you had better not wait,' said he, in a significant tone. 'If you were a millionaire, and without reproach, you could not marry her now. You are supplanted—forgotten! Do you know Colonel Woodward? He lives at Thurrock Hall. That's the man she's going to marry. Do you doubt me? Ask the first village gossip you meet if it's not true!'

Upcraft went out without another word. Mr Bryce walked to the window and peered after him into the fog. He saw him pass into the high-road and turn his steps towards Thurrock village. Then he began to pace restlessly up and down his room. At intervals an elastic flame lit up his face; it was full of craftiness and fiendish thought. He had been scheming for years to marry Jess to Colonel Woodward of Thurrock Hall; and suddenly this man Upcraft became again an obstacle in his path!

A decanter stood on the table. He emptied the last drop out of it into his wine-glass, drank it off and then rang the bell. And now he stood grimly smiling, with his face half-turned towards the door; and he seemed as though listening to the signal-gun, that still boomed across the marshes like an ominous voice.

John Upcraft heard it too. He stopped abruptly, and pressed his hands to his ears to shut out the sound. It carried him back to that terrible night, three years ago, when he was out upon the marshlands, a miserable convict, shivering with acute ague. Surely he was still the convict—surely it was for him that the gun was firing! The old sense of horror recurred. He shook from head to foot; and it was only by repeatedly touching his fur coat and passing his hands over his limbs that he could convince himself that he was no longer in prison garb, no longer hunted. In his grief and overwhelming despair, he began to wish that Jessie Bryce had left him

to die in the marshes where she had found him. It would have been kinder, a thousand times kinder, than to have recalled him to life in order to subject him to this misery. For the moment he was sorely tempted to strike across the marshlands and reach the river-side, where with one leap he could end it all. But his better judgment soon prevailed. He conquered the momentary weakness, and went on towards the village with a growing strength of purpose in his step. There was no sense of shivering now, no thought of bending to destiny. The lights of Thurrock village had come in sight. He was erect and determined; and he presently walked into the village inn—an inn called the 'Old Hulk'—with little trace of the recent suffering to be seen in his resolute face. But the crowning test of Upcraft's moral strength now awaited him.

The bar-parlour of the 'Old Hulk' was small and cosy. There was a table in the centre, around which a number of men were seated. Some had drawn their chairs close to the board; while others sat back against the wall, seeming to prefer a more distant view of the glass or tankard to which they laid claim. The company had raised a pretty thick fog, in opposition to the fog outside, with their tobacco-smoke; and Upcraft, by way of making it denser, lit a cigar, after taking a vacant seat near the window. A light resembling an old ship's lamp hung from the ceiling. But Upcraft had no dread of being recognised, for this was almost the first time he had set foot in Thurrock village.

A silence had fallen upon the company when Upcraft came in, but only for a moment. An elderly man with a closely-shaven face soon took up the thread of talk. He gave a nod before he spoke, as if to challenge contradiction. 'So I say. He's a gentleman.'

'Ay,' chimed in a middle-aged, hook-nosed man—'and a rich un too! What more do a girl want?'

'Look at his age!' said a youth, disparagingly. 'He's older than she be, yer see, by twenty year.'

'They haven't settled the day,' said a wrinkled person in the chimney corner, whom Upcraft took to be the sexton, 'have they?'

Before an answer could be given, a carriage drove up to the inn door, and all eyes were directed towards it. The landlord was seen to hurry out. Then the window of the carriage was let down, and a face appeared there in the light of the carriage lamp. It was Jess.

Upcraft's first impulse was to go out to the door and greet her. How beautiful she looked! A great yearning possessed him to hear her voice. He longed to touch her hand once more. But the impulse was quickly mastered. He sank back in his chair. She was in Colonel Woodward's carriage, and of course he was at her side. The taproom gossip had fairly confirmed old Bryce's words. She was Colonel Woodward's fiancée. It was too late!

Jess had stopped at the inn to inquire after a sick child. At the moment the horses were about to start off, she caught sight of Jim. The boy was flushed and out of breath. She stopped the carriage and looked out. 'What is it, Jim?'

'Let me in!' was his answer, as he raised his arm, trying frantically to reach the handle of the carriage door—'let me in!'

Jess opened the door: Jim scrambled up the step; and the carriage went on, by the marshland road, towards the cottage.

The boy's whole look and manner alarmed her. She drew him to her side, for they were alone in the carriage, and she waited impatiently for him to speak. In the silence, the boom of the signal-gun struck upon her ear for the first time to-night and set her heart beating fast.

'Look here, miss!' said Jim, the moment he recovered breath—'you know that convict? He's escaped agin!'

She caught him distractedly by the arm. Her face was now more eager than his: 'Tell me—quick! Have you seen him?'

'Seen him!' said Jim, with a wondering look. 'You know what dark eyes he's got? I know'd him agin the moment I met his eye. Don't yer remember? I never see'd his face, rightly speaking: it was covered with mud; weren't it? His eyes was what I see'd. I was a-holding the lantern, and he opened 'em on me.—Look 'ee here, miss! He opened 'em on me this a'ternoon at the front door just the same.'

'Not at the cottage, Jim? He can't have been there!'

Jim nodded. 'He didn't stop long. He had a word or two with master; and then I heerd him go out. Then master rang his bell; and while mother went to answer it, miss,' said the boy, 'I slipt away. I ran down the road; I caught sight of him, though I couldn't catch him up. But I followed.'

'But why,' said Jess desperately, 'why have you lost sight of him now?'

'I haven't, miss. He's at the inn—at the "Old Hulk." Didn't you see him a-staring at you out o' the bar-parlour window a moment ago?'

A cry of delight was Jessie's only reply. She lowered the carriage window and put out her head. She could see a light in the cottage, shining dimly through the mist; and in another minute the carriage drew up at her home.

'Jim,' said she, laying her hand on his shoulder, 'stay where you are. I want you to take a letter to him instantly. Not one moment must be lost! The carriage will put you down at the inn. But not a word to any one—remember that! The letter I'm going to give you must be trusted to nobody. Place it yourself in his hands. Do you understand?'

'Yes, miss.'

Mrs Gilkes opened the door. 'You didn't happen to meet my Jim along the marshland road; did you, miss? He's at his tricks agin!'

'You needn't worry yourself about him,' said Jess. 'He's in the carriage, and he's going on an errand for me.' She entered the study while speaking, and finding it empty, sat down at her father's desk and wrote on a slip of paper: 'DEAR JOHN—Come back to me!—Jess.' This she put into an envelope and sealed; then she went out and handed it to Jim at the carriage window. 'You'll give it to no one else?' she reiterated—'or speak of it to a living soul?'

Jim promised; and the carriage drove away. Jess watched it out of sight; then she turned to

Mrs Gilkes, who still stood at the front door: 'Where's father?'

'Gone up to London, miss. He left a letter for you on the study table. Didn't you see it?'

'Gone to town?' said Jess, mystified.

The letter consisted of a couple of hurriedly-written lines: 'A matter of importance takes me to London. I shall not return to-night.'

That was all. There was no word of explanation. What could have induced him to take so sudden a step? He could only have one motive, as she thought: he had seen John. Angry words had passed between them: he had driven Upcraft from the house with gibes and insults; and now he had gone to London to give information against him—against the man she loved—the escaped convict.

It was pitiable. But the thought of her father's unkindly action did not greatly distress her to-night; her heart was too full of happiness. She sat down beside his study fire, rejoicing to think that he would be out of the way when Upcraft came. She would make up to him for her father's insults with loving words. She stirred the fire into a cheerful blaze; then she began to listen for his coming. He could not be long now. He would be sure to outstrip Jim, in his haste to reach her side, the moment he had read her message.

The minutes went by; but neither John nor the messenger appeared. Presently Mrs Gilkes came in with the tea-tray. Jess was sitting with her head between her hands, looking vacantly before her.

'A bit lonely, ain't you, miss?' said the woman soothingly. 'Well, it ain't to be wondered at. You'd like me to stop and sleep here to-night, maybe?'

'Yes, please, Mrs Gilkes.—How long has Jim been gone?'

'A good ten minutes,' said the woman.

'Not more?'

'Not a minute more by the kitchen clock,' said Mrs Gilkes, 'I do assure you.'

'It seems like an hour to me,' said Jess. Then she added, looking round at the tea-tray: 'Would you bring another cup? I am expecting a friend.'

The little brass kettle on the hob began to sing. John would soon be here now. In another ten minutes she might safely count upon hearing his step upon the road. Her heart beat faster at the thought. She would hurry out and call to him by name, and see his arms held out to take her to him at last.

It was getting late. The ten minutes had stretched into an hour—an hour into two—and still there was no sign of John Upcraft's coming. What could the reason be? If the boy had not found him at the inn, he would surely have returned to tell her of his failure long ago. She became filled with the dread that something had happened. Mrs Gilkes's restless step in the kitchen told Jess that Jim's mother, too, was getting anxious. She could stop indoors no longer. She drew on her hooded cloak, and went to the kitchen in all haste.

'I'm going down to the village, Mrs Gilkes,' said she, 'to look for your Jim.'

'Thank 'ee, miss! I am a bit worried about

him,' said the woman tremulously; 'though he's old enough now, you would think, to take care of himself; wouldn't you?' While speaking, she lit the lantern. Jess took it from her, and stepped out into the cold and heavy mist.

She was painfully reminded, as she groped along, of that night when out upon the marshes three years ago. But the air was keener to-night, and the mist far denser. But she went bravely on towards the village, stepping upon the rays from the lantern as fast as they fell in her way. How silent the marshlands seemed—how desolate! Nothing audible but the pattering of her own hurrying feet upon the frosty ground. The noise of the signal-gun had ceased at last.

But presently the pattering of other feet caught her ear. She stopped to listen, thinking that the sound might be the echo of her own. But no: they still came on—nearer and nearer.

It was Jim's step! She recognised it now. She raised the lantern above her head and called to him loudly. She received no answer, except a quickening of the pattering feet; and in another moment Jim—hot-faced and horror-stricken, as he looked—came within the narrow circle of light.

'Jim! What is it?'

'I—I've found him!' said Jim distressfully.

'Where? Wasn't he at the inn?'

'No, miss, he wasn't.'

'Is he there now?'

'No, no, miss.'

'Then where—where is he?' said Jess.

Jim burst out crying. 'Mur—murdered,' sobbed the boy, in a frightened whisper, 'in Thurrock Wood.'

THE GENIUS OF LEONARDO DA VINCI.

It was in that golden period in the history of art, the few years between 1490 and 1520, when the greatest painters whom the world had ever seen were living and working together, that Leonardo da Vinci flourished. Bright, indeed, were those days for Italy which saw Michael Angelo, Raphael, Correggio, Giorgione, Benvenuto Cellini, and Titian. The son of a notary at Florence, and called Da Vinci from the place of his birth, Leonardo, who was born in 1452, created for himself a name that can well be placed in the list of his most illustrious contemporaries. He was at once painter, poet, sculptor, anatomist, architect, engineer, chemist, musician, mechanic, and philosopher, although his fame now rests on his accomplishments as a painter. While young he was placed under Andrea del Verrocchio, a painter and sculptor of some note, who employed the youth to execute one of the angels in a picture of 'The Baptism of Christ.' This he did with so much softness and richness of colour, that it far surpassed the rest of the picture. Verrocchio, when he saw this, was so struck with mortification, that he never again took up his brush, and confined himself to his sculpture, 'enraged that a child should thus excel him.'

It happened about this time that a peasant on the estate which his father owned brought him a circular piece of wood cut from a fig-tree, and desired the young painter to make him an ornament for his cottage. His father urged the boy

to grant the request, and a most unlooked-for production was the result. The boy gathered from the neighbouring swamps all kinds of hideous reptiles—adders, lizards, toads, snakes, and many other repulsive crawling creatures—and from these models he compounded a monster, which he depicted as about to issue from the shield. When finished he led his father into the room, and his terror and horror proved that the boy was successful. This production was afterwards sold by Leonardo for a hundred ducats, and subsequently found its way to the ducal palace at Milan; but was destroyed in a looting raid as an object of horror by those who did not appreciate art. The poor peasant lost his promised shield, but was satisfied by another on which the boy painted the simple subject of a heart pierced with a dart.

When Da Vinci was about twenty years of age he became a member of a guild of painters, and began work as an independent artist at Florence, where he executed many pictures of great credit, in which the universality of his genius soon appeared. He was by far the greatest physiologist of his time, and the first who made a study of anatomy as connected with art. He wrote a book on the Anatomy of the Horse, and afterwards made an almost exhaustive study of the human frame. He was well skilled also in optics and geometry, was a good carver, had an excellent voice, and invented a species of lyre for himself, to which he would sing his own verses and music. He had a well-formed person, and delighted in manly exercises; was dexterous in the use of arms, and loved well to manage a high-nettled steed. The fame of Leonardo da Vinci soon spread all over Italy, and the Duke of Milan invited him to his court; and having formed a design of supplying the city of Milan with water by a new canal, Leonardo was entrusted with the management of the affair. This canal is two hundred miles in length, and is a masterly piece of engineering.

After serving the Duke in the capacity of architect and engineer, Leonardo was requested to exhibit his skill as a painter. His celebrated 'Last Supper'—his chief work—was the result. It was painted on the wall of the refectory of the Dominicans. The work took him a very long time, for he would wander about the city searching for models to serve for the various persons he wished to depict, and whenever a group or an attitude struck him he drew it on his tablets. All was finished with the exception of two persons—the one was the figure of Christ, and the other was the disciple Judas. He had wandered far, and had searched high and low, but could not find a presence noble enough for the one, or a physiognomy base enough for the other.

A year elapsed, and still the picture remained unfinished. At last the prior of the convent complained to the Grand-Duke of the unnecessary delay of Da Vinci in completing the picture. The artist in defence pleaded that he worked at the picture for two hours every day.

'May it please your Highness,' said the overbearing prior, 'he has not entered the convent doors for a year.'

'It is true I have not entered the convent,' said Leonardo; 'but it is also true that I have worked

at the picture for two hours every day. I have at last succeeded in finding a head which will serve as a model for the greatest and the most noble being that ever trod the earth. The head of Judas remains to be done; and I have for six months past frequented daily, morning and evening, the Borghetto, where the lowest refuse of the population live. I have not yet found the features I am in quest of. These once found, the picture is finished in a day. If, however, I am not successful in my search, I shall rest satisfied with the face of the prior, which would suit my purpose excellently well, only that for a long time I have been hesitating about taking such a liberty with him in his own convent.'

From the fact that it was painted in oil upon plaster that was not dry, this great picture was, unfortunately, very short-lived. It was finished in 1498; in 1540 it is spoken of by Armenini as half effaced; and Scannelli, who examined it in 1642, wrote of it as 'a thing that once was.' Its beauty was not improved by the improvements of the Fathers, who, in order to reach their kitchen the easier, cut a doorway clean through the middle of the picture. In 1726, with singular vandalism, the order employed an artist, Bellotti, who pretended to restore the lost colours, but who really painted the whole picture over again; and finally, in 1770, one Mazza scraped off most of the few outlines that remained of the original, and inserted heads of his own, with the exception of three, when he was stopped by a new prior, who revered art and the name of Leonardo da Vinci.

The history of this unfortunate masterpiece is by no means ended, nor the chapter of accidents at all completed. In 1796 Bonaparte forbade any military use to be made of the chamber, but soon after one of the generals, ignoring the order or not knowing of its existence, knocked down the doors and made a stable of it. The dragoons amused themselves by adding to and embellishing the picture. For some years the room was used as a military store; and in 1800 a flood penetrated into it and covered the floor a foot deep with water, which was suffered to remain until it dried up of itself.

Such is the history of Da Vinci's 'Last Supper.' Happily, however, Francis I. had a copy taken of it, which he placed at St Germain; and numerous contemporary copies exist, although the great original is mouldering away on the wall of the convent of the Madonna delle Grazie.

In 1505, after Da Vinci had been driven out of Milan by the disturbances in Lombardy, the Florentines commissioned him to paint, together with Michael Angelo, the Council Chamber of their city. A jealousy arose between the two artists, and each having his partisans, they became open enemies. About this time the young painter Raphael came to Florence to see the wonderful works of the great Da Vinci, and they made so strong an impression upon him as to produce a change in his own style of painting. In 1513, Da Vinci left Florence to proceed to Rome, where Leo X. resolved to employ him, upon which the artist set about distilling oils and preparing varnish with which to cover his pictures. Leo, on hearing of this, said, that 'nothing could be expected from a man who thought of finishing his works before he had begun them.'

In 1516, Leonardo visited the court of the young French king, Francis I., who bestowed upon him a yearly allowance of seven hundred scudi and a residence near Amboise. Here the great painter expired, 2d May 1519, aged sixty-seven years.

The genuine works of Leonardo da Vinci are exceedingly rare. In the Louvre is a celebrated production of his, 'St Anna;' and in the National Gallery is a good specimen, 'Our Lady of the Rocks,' where it will be observed that though his figures are graceful and expressive, his rocks in the famous picture are 'literally no better than those on a china plate.' Most of the pictures now attributed to him were wholly, or in part, painted by his scholars or by imitators from his cartoons. Of nine pictures in the Louvre attributed to him, three only are considered genuine. In the Royal Library at Windsor there are three volumes of manuscripts and drawings, containing a vast variety of subjects—portraits, heads, groups, and single figures; fine anatomical studies of horses; a battle of elephants, full of spirit; drawings in optics, hydraulics; plans of military machines, and musical airs noted in his own hand. The Royal Library at Paris contains several of his philosophical treatises, one of which, the *Treatise on Painting*, has been published, and is the foundation of all that has since been written on the subject. His manuscripts are very difficult to decipher; the letters are formed in a most fantastic manner; and, moreover, the writing reads from right to left, and was written by the author backwards, and with his left hand, though to this day no one knows the reason why.

UNDER THE CHERRY-TREE.

PART II.—CONCLUSION.

IN such full cry was the hunt, that when half-way round the tree the Baron came upon a lady whose approach he had not observed, it was all he could do to lower his weapon in time. During the moment of mutual amazement that followed, the lady's elderly countenance settled into an expression of displeasure mingled with disgust.

'So the African cannibals have *not* dined off him.' Something in this strain would have run her thoughts, if put into words. 'Back again, like the worst penny that ever was!'

'My deepest respects to you, Countess!'

'Good-morning to you, Baron Blasewitz. Would you mind telling me—ahem—what you are doing with this—this broom? Have you brought it back from your travels?' Here the Countess had recourse to her eyeglass for the purpose of a closer examination. 'I presume it is an African specimen?'

'Pardon me; it is the vulgar European broom. I take the liberty of introducing myself as cherry warder.'

'As what?'

'As cherry warder. This broom is the badge and sceptre of my office.'

'I don't believe a word of it, of course,' reflected the Countess. 'There is some deeper meaning here. I have always said that he is a most dangerous and undesirable person.'

'Up there, Countess, hangs the prosperity of

a poor widow who has a quantity of children—six or seven; I don't remember exactly how many.'

'A poor widow? I am a widow myself, and therefore I have always a most particular sympathy for widows.'

The severity of the Countess's features relaxed. After all, there seemed to be some truth about the matter; yet, notwithstanding, she felt convinced that the man was on Angélique's track.

'Have you not happened to catch sight of my niece, Baron Blasewitz?' she inquired, very craftily, as she considered.

'Your niece? Yes; that is to say, I saw her from a distance.' (There was no need to specify how short that distance had been.)

'He is trying to deceive me,' was the Countess's wrathful reflection.

'And where was my niece, pray, when you saw her—from a distance? I have been searching for her for this last hour in vain.'

The Baron's reply was very quietly but firmly to hand over the broom. 'Permit me, Countess.'

In her surprise, the Countess actually took it between two fingers. 'What is the meaning of this?'

'I shall be back again in five minutes; I am going to look for your niece.'

'Wait, Baron Blasewitz—stop! That is not what I meant.'

'I understand perfectly what you mean,' called back the Baron, already started on his quest. 'Make your mind quite easy, Countess; I am sure to find her.'

'Wait, Baron Blasewitz!' cried Angélique's aunt in an agony. 'I am coming with you—I am coming after you!'

'Think of the cherry-tree and of the poor widow with the eight children!' were the Baron's last words as he vanished over the curve of the hill.

A poor widow with eight children—to be sure; the Countess had almost forgotten that part of the matter. After all, one could not be so heartless; that is to say, supposing there was any truth in the story. But, all the same, the situation was highly vexatious. If only Angélique were back again! It was absolutely certain that that scamp of a Blasewitz knew where she was; he had smiled so diabolically. Yes, that Mephistophelean smile enlightened her. It was all a plot. It must be baffled; but how? To follow them would be to leave the tree unguarded, and that probably meant starvation to the widow and her eight children!

'In Heaven's name, help! help! help!' burst from the Countess's agitated lips.

An apple-cheeked, cherry-lipped village maiden was the first to answer the cry. 'Where is it you have hurt yourself?' she asked, a little breathless from the pace at which she had come.

'Nowhere, my dear child; it is only my fears, my excitement. I must be off; but you, my child, remain here; take this broom. Think of the widow with the nine children; do not leave this spot.—Oh Angélique, Angélique!' And pressing the broom into the new-comer's hand, the Countess turned and fled down the pathway.

'I don't understand a word of it,' was the buxom maiden's conclusion. 'A widow, did she say she was? And has got nine children? And I am

not to leave the spot? Well, I don't mind staying, since there are plenty of cherries to eat, and I know that Sepperl wouldn't grudge them to me. But I can't get the broom to fit in at all. Nothing particular to be discovered about it, either, turn it round and round as I may. Well, I shall not let my hair grow gray over it; I shall just tell Sepperl. Oh, the sweet cherries!' And tossing aside the broom, the latest arrival under the cherry-tree set to work upon the branches.

She had been most pleasantly occupied for more than five minutes, when Baron Blasewitz reappeared over the brow of the hill, not in the best of humours, for he had failed to catch even a glimpse of Angélique. 'I am inconsolable, Countess,' he began; but here the branches rustled, and a laughing face looked out from between the leaves.

'Ha, lass! what are you doing there?—Hold, I say!—Heavens! My promise to Angélique, the post which she entrusted to me!—Leave the cherries alone, I say!'

'Mind your own business.—What can such a fine gentleman have to do with the cherries, pray?'

'Unlucky creature! what brought you here?'

'A lady, a very fine lady indeed, gave me that broom there, and said she was a widow with ten children.'

'The children seem to be multiplying in proportion as the cherries are decreasing,' reflected the Baron within himself, at the same time that he angrily possessed himself of the hand full of cherries which the girl was attempting to hide from him.

'Don't be rude, or I'll tell Sepperl,' she laughed, turning away to stuff cherries into her mouth with the other hand.

'The other hand! Give me the other hand!' cried the Baron, too absorbed in the object of the moment to heed the light step which was drawing near over the grass.

It was fortunate for Countess Angélique that Mother Resi's precious cherry-tree was not the only one which grew upon this patch of ground, for without the support of a friendly stem, it is not improbable that this much-tried young lady would at this juncture have fainted. As it was, she had to rub her eyes and look again. No, there could be no mistake; he was holding the creature's hand. Then she had guessed aright; it was a *rendez-vous*. 'And, oh dear, she is pretty, very pretty,' groaned Angélique at the bottom of her palpitating heart.

'Countess Angélique!' and, with a start, the Baron let go the hand he was holding, the owner of which ran off, still laughing and still in possession of the plunder. 'Countess Angélique, you perceive my embarrassment!—'

'I perceive it,' assented Angélique in a voice which unluckily was not quite so steady as it was chilly.

'What can I say in my defence?'

'Pray, do not trouble yourself; I neither expect nor wish to hear any defence.'

'Angélique, why this cruelty?'

'Who has given you the right to call me by my name?'

'But ten minutes ago I did so!—'

'Ten minutes ago! Ten minutes ago I was foolish and blind. Ten minutes ago, you had

not abused my confidence, abused it most unworthily'—

'But after all'—

'Oh, I can keep my calmness no longer. Answer me plainly: do you confess yourself guilty—yes or no?'

'Unfortunately, my guilt is too staring to be screened.'

'What flippancy!' she thought aghast. 'He says it to my very face!'

'Angélique, you are crying!' For in truth she had pulled out an exquisite morsel of lace and *batiste*, and was gasping for breath behind it. Of the two, the Baron was undoubtedly the most thunder-struck; nothing had prepared him for the stolen cherries being taken so tragically. 'What a heart she has!' he reflected, in a mixture of agony and admiration, and quite oblivious of the fact that the tree was being meanwhile plundered at leisure by the very scum of the village street. 'She is mourning for the poor widow with the dozen children!—Angélique!' he pleaded, 'calm yourself; it is not such a very bad case.'

'It is bad enough. Go away, Baron Blasewitz, go back to Africa; let me never see you again. My aunt was right; I should have believed her sooner.—Ah! here she comes!' as the Countess emerged upon the pathway with bonnet somewhat awry and a flounce hanging in a loop from her skirt.

'Here I have them at last!'

'Dearest aunt!' sobbed Angélique, throwing herself into her aunt's arms, 'you were right; he is a worthless man; I wish never to see him again.'

'I always told you so,' gasped the Countess, still somewhat short of breath.

'Sepp! Sepperl! Seppi!' rang out from the background; and before any more words had been exchanged, Mother Resi appeared, armed with a long-handled wooden spoon. 'Sepperl, the soup is in the basin.'

But here her eye fell on the broken branches, the torn-off bunches of the pillaged tree, and she stood still in consternation. 'So that's the way my cherries are looked after! Wait a bit, you good-for-nothings!' This time it was the wooden spoon that swept the coast clear. 'Sepperl! Sepp! The wretched boy is right enough to hide himself.'

'Take time, take time; I'm coming.' And laden with something wrapped in a red cotton handkerchief, Sepperl emerged from between the trees.

'Look at the tree!' screamed his mother, taking him by the arm. 'Where are the cherries gone to? Ha?'

Sepperl looked and rubbed his eyes. 'Well, anyway I didn't eat them, and I didn't leave them alone either. That young lady took the broom away from me.'

'And I gave it to Baron Blasewitz.'

'And I handed over my sceptre to Countess Lilienburg.'

'And I left that most objectionable broom in the hand of a pretty peasant girl who was passing at that moment.'

'What? All these have watched my cherries, and that's all that remains of them!'

'There isn't more than one pretty peasant girl for five miles round,' decided Sepperl. 'That

can't have been any one but Mirzl.—Here she comes, by good luck.—Mirzl, let's hear what you did with the broom?'

'The broom?' laughed Mirzl, as she joined the group. 'Why, I let it lie on the grass, to be sure. One doesn't require a broom for eating cherries.'

'My cherries!' cried Mother Resi. 'Even she robs me!'

'Make your mind easy; I hadn't the chance of robbing you half as much as I should have liked, for scarcely had I begun, when all at once there rushes up that rude man there and tears away my hand from the tree.'

'Rude man?' Did Angélique's ears hear aright? Could that have been the reason?—

'I could not do otherwise, my good girl. The tree had been entrusted to my care, and I was responsible for the cherries.'

A mist seemed to be rolling away from before the young Countess's eyes. She began to think she had been very stupid.

'What have you got inside that handkerchief?' inquired Mirzl, who meanwhile had been coquetting with Sepperl's red bundle. 'Is it anything for me?'

'Take time. It's something for the young lady there; but her aunt is not to see it.'

'My niece has no secrets from me,' said the Countess quickly.

'Oh, you are the aunt, are you? Then it's you who aren't to see it.'

'I am lost,' breathed Angélique in an agony, just as the well-meaning Sepperl nudged her elbow and slowly opened the red handkerchief. 'Is this your keepsake, perhaps?'

'Goodness! can that be my locket?'

'Well, it's a bit smashed up, to be sure; but that comes from the nails in my boots; but anyhow, the picture is in one piece, and do you know what I'm thinking?—

But what it was that Sepperl was thinking never came to the light of day, for at that moment Countess Lilienburg, looking over her niece's shoulder, almost shrieked out, 'Baron Blasewitz!'

The events that followed upon the Countess's exclamation came at so giddy a pace that nobody understood what was happening until it had actually happened. The Baron in reply to what he took to be a summons, sprang forward just in time to pick up a small object that had slipped from Angélique's trembling fingers.

Had he seen? was the question which dyed her cheeks redder than the ripest of the cherries that grew upon Mother Resi's tree, as she put out her hand for the morsel of paper. One terrified glance at his face was enough for the answer: yes, he had seen.

'And that locket was yours, Angélique? I may call you Angélique now, may I not?'

'I—I don't know what to say.'

'Do you find it so hard to pardon my want of vigilance as cherry warder?'

'Oh, bother the eternal cherries! That was not what put me out of temper; it was'—

'What, then?'

'That girl over there—you were holding her hand.'

'Oh, bother the clumsy girl; to me she was only a cherry-eating machine.'

'He calls her clumsy!' rapturously reflected Angélique, and in the same moment she was aware of her hand being taken.

'I may do it now, may I not?'

'No, you may not,' interposed the Countess excitedly, recovering from a momentary attack of stupefaction. 'Questions of that sort are put to the aunt first, and to the niece afterwards.'

'Take time,' advised Sepperl soothingly. 'It's too late in the day to begin scolding now. They'll have to get their own way, you see.'

'Dearest aunt'—

'A pretty business indeed! But it can't be helped now, I suppose. That unlucky cherry-tree!'

'Oh, that lucky, lucky cherry-tree!' the Baron ventured devoutly to murmur under cover of his moustache.

'Take him, then, for goodness sake, and see if you can turn this madman into a sensible husband.'

Aunt and niece had been in each other's arms for at least a minute, when the attention of the bystanders was diverted by the reappearance of the same spruce, muslin-aproned young person whose visit had surprised Mother Resi earlier in the day.

'I have come back again on account of those cherries,' said Frau Netti, going up to Mother Resi. 'You had better gather them at once, for there are thunder-clouds rising. Wet fruit won't keep a month.'

'They're gathered,' said Mother Resi, wringing her hands, 'but by other fingers than mine.—There, look at the tree!'

Frau Netti turned and looked, and in her amazement almost dropped her sun umbrella. Was this poor battered and stripped caricature of a cherry-tree indeed identical with the richly-laden specimen which had rejoiced her connoisseur's eye scarcely an hour ago?

'Those good-for-nothing village rascals,' sobbed Mother Resi, disappearing behind her apron. 'But as for its being my fault'—

'Whose fault, then? In truth, there is no putting trust in these peasant folks!—Good-evening; I shall buy my cherries elsewhere. A very good-evening to you!' And the confectioner's wife lounced off with her sun umbrella at a distinctly aggressive angle.

'Two kreuzers beyond market-price,' came in gulps from Mother Resi. 'I'll never get such an offer again.'

'What was the value of the cherries?' asked Baron Blasewitz, feeling that this was not a day on which he could with any patience bear the sight of tears.

'At least forty florins.'

'I shall give you fifty.'

'And I as well,' Angélique hastened to add.

'You may put me down for the same sum,' said the Countess with a tolerably good grace.

'A hundred and fifty florins!' Mother Resi's broad countenance reappeared from behind the apron. 'Well, well, to be sure, it's a better cherry year even than I thought. I don't remember having seen its like in all my living days.'

'Nor I either,' unhesitatingly assented the Baron.—'What say you, my love? Have you

ever known such ravishing cherries as grow upon this tree!'

The question was put in an undertone, and Angélique's answer is not on record.

A LINK WITH THE PAST.

BEFORE me lies an old pocket-book, bound in faded red leather, with silver clasps. I have counted the leaves of old yellow paper and find there are two hundred of them. It is an ungainly-looking article for a lady's pocket-book, but this one belonged to my great-grandmother, and pockets *were* pockets in her day. (If anything was lost in her house, her sons would say, 'It must be in Noah's Ark,' meaning one of her pockets. She always wore two, one on each side.) The latest date in it is 1775. Her firm handwriting, the slowly, carefully formed letters, show the serious business that using ink on paper was in those days, and even now the ink is black as jet.

A pocket-book should show the character of the possessor. This one tells the tale of a life; for there are more medical recipes in it than any others, though I find many cookery recipes, such as, 'My Aunt Betsy's Way of making Mince Pies,' &c.; and other entries, as 'John Hunter came to pay me one year's rent for his cottage at Wild Moor, Two pounds fifteen shillings, September the 22d, 1769.' Or, 'Paid my maid, Febe Barber, fifteen shillings for one quarter's wages, 14th day of March 1772.'

My great-grandmother was the widow of a doctor, who had settled down on his marriage in a country cottage in North Hampshire, on an open tract of common land, surrounded by moorlands and water-meadows, often half-flooded over by the river that ran through them, desolate enough in winter, but lovely beyond description in summer. Her short married life, as I have been told, was a very happy one. Her husband's love, till the grave parted them, was that of a devoted lover. He died, leaving her with two boys, one four and the other two years old.

After she had braved the first days of sorrow and the nights spent in grief, her boys would creep into her room in the morning and lay their heads on her pillow, wet with her tears. Then hope would come back. Amongst her neighbours she was counted rich, for she had fifty pounds a year of her own. And who in the whole country-side could distil waters as she did, or know more of herbs and medicine than she?

A few nights after her husband's death, a man came to her in great trouble. He was the tenant of the Court Farm—a man who wore leather gaiters, a long green linen smock-frock, and a straw hat of home-platted coarse straw. He knocked at her door, and, with trembling, courteous words, begged to be excused. 'But our little Ben is taken with the croup, and no one to help him now but you, dame! If you will come and see him before he dies, it will be some comfort to poor Jeannie.' He would put her on Jock, her husband's white cobby.

She straightway donned her wimple and old brown Spanish merino cloak—in her day merino

came from Spain—a full cloak, fuller than the skirts of these days. It was neatly gathered into a yoke. A black, velvet-lined tippet reached the waist. It was tied with strings at the neck, and fastened down the front with clasps. It had large arm-holes to pass the arms through. Her saddle, or pillion, was covered with thick gray quilted cloth, and hung in an inner room of her house.

When Farmer Maynard came to the door with the old cob, her maid appeared with this structure, which was hurriedly put on the back of the docile animal; and Dame Baker mounted, with the assistance of her maid Febe, who at the same moment hung a small reticule basket of white and black squares of platted straw on her arm, containing a silver spoon and a bottle of simple emetic; and then the dame started with her guide to the Court Farm, two miles distant. The Court Farm was an old red brick building standing within fifty yards of the parish church, the lychgate of which they passed by in the moonlight, and the churchyard where her loved husband now slept. A firm resolve came into her heart, that henceforth, as far as she could, she would do his work amongst those who called upon her for aid or help.

On entering the house, they found Mrs Maynard sitting by an old oak crib, in which lay little Ben, throwing himself about in an agony, with the hoarse croupy groans following fast one on the other, his poor little face black and swollen. Dame Baker gently lifted him on her knee and poured out into her silver spoon a dose of her emetic, and then she asked for mustard. Alas! none was in Mrs Maynard's store. 'Bring me the kettle; we must use hot water.' She took from her neck a silk handkerchief, and after carefully rolling it up into a tight ball, she held it on the child's throat, and with her steady hand poured enough boiling water to raise a small blister. She then turned the child, and proceeded to do the same just at the nape of the neck. A short time of suspense, and then the false membrane was thrown off; then came relief, followed by a deep sleep; and shortly, health returned.

From that day, my great-grandmother took her husband's place. No doctor lived within twenty miles. Often at night she might be seen—sometimes with a stalwart form beside her, lantern in hand, leading her pony—making her way to some out-lying home. Or in the dark days of winter, when the new hedges are set in the fields, an anguished worn face, with an arm in a sling, would come to her, with the cruel, poisonous blackthorn embedded in the poor burning inflamed palm, or deep between the fingers; and with gentle, soothing words she would immerse it in some cooling cataplasm, and extract the poisonous thorn. In those days the country folk were still superstitious, and they believed she knew some charm; but, to use their own words, they would say the dame 'whispered it out.'

She never took any fee; but the farmers would send grain from their granaries to her; the Squire, game and fish; the parson, a choice plant, or tree, or fruit from his garden. The poor people would bring the herbs and roots that she asked them for; the children, nuts and berries.

In her turn, she gave liberally from her stores wherever she saw a case of need.

On the occasion of the only visit the Squire and his lady ever made to London, they brought her a beautiful pair of pattens with embroidered leather straps. (All ladies wore pattens in those days.) The Squire and his lady ordered silver rings to be put on hers, for the old Squire said, 'She deserved to walk on silver. Hadn't she cured their only son of an ague?'

Her two sons grew up good and handsome, and settled on farms of their own near her. She lived to be a little over fifty years old; but after one of her long night journeys in the snow of winter, that took her past the old gray ruins of Silchester—a place that filled her with strange mystic fancies, as she said—on her return to her home she went to bed; and when morning came, they found her calm and placid in her last sleep. They buried her beside her husband in the old churchyard, close to the red brick Court Farm. Her generation passed away, and another since. The old church and the old farmhouse are still standing, and looking the same now as they did then. But all that is left of my great-grandmother are the old recipes in her quaint handwriting in the old pocket-book with the silver clasp.

TOM AND I.

THE meadow with its clover sweet
Stretched far before our view,
The daisies grew beneath our feet,
The hyacinths were blue.
I saw o'erhead a merry band
Of purple swallows fly,
When we walked through the meadow-land
Together, Tom and I.

The linnet piped amid the sedge,
The blackbird's notes were gay,
On hill and plain, on bough and hedge,
The happy sunshine lay;
He questioned as he held my hand
I murmured a reply,
As we walked through the meadow-land
Together, Tom and I.

And oft the spring has brought since then
The bloom to pear and peach,
The violets to the lowly glen,
The green leaves to the beech,
And scattered with her fairy wand
The gray mists from the sky,
Since we walked through that meadow-land
Together, Tom and I.

And we have had since that spring day
Our share of good and ill,
And now, though old, and bent, and gray,
We're fond, true lovers still.
In perfect faith, and hand in hand,
We wait the parting night,
Since we'll meet in the better land
Together, Tom and I.

A WEIRD CRATER LAKE.

It is not commonly known that the little West Indian island of St Vincent can boast one of the finest craters in the world (Souffrière), and indeed one that may be classed among the largest; for, though some craters have considerably larger apertures measured round the top, they dwindle to a small vent below; while here you can look down a ring of awful cliff, nowhere short of a thousand feet high, into a circular lake beneath you, and this lake is no less than three miles in circumference. Had you lived two centuries ago, you would have beheld a very different sight: no lake, but a vast cone of ashes rising from those depths, and tapering gracefully upward till it towered many hundred feet above even the lofty surrounding lips. This cone had become one of nature's gardens. It was studded with a profusion of trees and flowers; and the echoes of the cliffs resounded to the songs of many birds which found a happy home there—among others, the souffrière bird, peculiar to this mountain, and hence its name.

But one fine day towards the close of 1718 the giant below turned in his sleep, and every vestige of the cone, with its living adornments—birds, trees, and flowers—was blown into the skies. How long it took to effect this transformation-scene into its present condition, there is no record; only it is known that the next visitors to the heights found the lake there; though whence its waters come is still a mystery, as there is no higher land to drain into it save its own steep edges; and there must of course be considerable evaporation beneath the tropical sun. Some years ago a boat was got down to the lake, and soundings were repeatedly sought, but no bottom could be found. In 1785 the crater was again active; but it was not till 1812 that what is known as the 'Great Eruption' took place. For two years previous, a tremendous internal pressure upon the crust of the earth had been seeking some outlet, and causing earthquakes of terrible violence over an area larger than half Europe, including within its bounds the Azores, the West

Indies, Venezuela, Colombia, and the valleys of the Mississippi and Ohio. The last of these unsuccessful struggles took place beneath the city of Caracas, in Venezuela. It was Holy Thursday, 1812, and the troops were drawn up and the processions formed to honour the day, when in an instant the soldiers were crushed to death by the fall of their own barracks, the worshippers by that of their churches. Humboldt puts the number of deaths at ten thousand, many others at twelve thousand. A month later, a sound like heavy artillery was heard in the mourning city, and preparations were made to resist an advancing enemy. Little did they know that these were the sounds of their deliverance from all further danger. For it was the mountain at St Vincent that had opened again, and relieved the pressure with a three days' eruption which is among the most remarkable of the century. More than Egyptian darkness reigned on the island, but the wonderful thing is how the black dust could get in the teeth of the easterly trade-wind to Barbadoes, eighty-six miles away. But it did so. The day after the eruption was over, the Barbadians could not even distinguish their own trees at mid-day, but they heard their boughs snapping all around beneath the dense silent rain of impalpable volcanic dust.

Again, as in the past century, the mountain had prepared a little surprise for the first visitors who should come to pay a call after the eruption. They found the grand old lake calmly sleeping below, as if nothing particular had occurred; but by its side was blown out a brand-new crater, so close to the original one that the wall of partition seemed to me less than a yard across at its top for a considerable distance. Evidently the subterranean passage to the lake had become so firmly blocked that even this mighty outburst could not force it.

The mountain seems to have been able to plan only one more surprise, which it put into effect in the form of the 'Little Eruption,' as it is called, of 1814, when it refused the crater opened two years before, and, with much less force at

its disposal, came through where the Great Eruption could not. The only written account extant is from the diary of a gentleman living at the foot of the mountain; and this was published in the 'St Vincent Government Gazette' of the 6th of May 1886:

'January 9th, 1814: At fifteen minutes after one p.m., a cloud of smoke was observed issuing from the Soufrière, a part of which appeared to roll down the side of the mountain towards Wallibon; and a large column shot upright to a great height. It continued to rise for upwards of half an hour, when it became detached from the mountain, and proceeded in a compact body in a direction nearly opposite to that of the wind at the time. At about five o'clock it had reached the eastern horizon, and by six had entirely disappeared. During its passage overhead the heat was excessive. This eruption was preceded by loud noises similar to those from the discharge of distant artillery.—January 12th: The craters were to-day visited by Mr Cummings and Mr Jennings. The eruption of the 9th proved to have been from the old crater, from which large rocks were ejected to considerable distances, some having been found upwards of a quarter of a mile from the edge of the crater. There is but little alteration in the appearance of the crater, but the water in it is boiling with great violence. The new crater remains unaltered. Much smoke has been seen to rise from the old one, and there is a heavy rumbling noise to be heard from the rim of it.'

And now at last came my chance of seeing this mighty Soufrière, with whose erratic history I was long familiar—one precious day in St Vincent, to be made the most of. At five in the morning four of us started on horseback, paying only three dollars each for the day. William, the midshipman, had made a rapid survey of the Admiralty chart, and pronounced the distance we had to go to be about ten miles. This was a mere nothing. But when we had gone more than twelve, there was a mutiny in our little band, and two of them indignantly rode back. William, who had so cruelly misled us, vowed to stick to me, and I declared I must do it or die. And we did it. Sixty-six miles under a burning sun did we accomplish that day; and I would go through it all again to-morrow for the sake of one hour by the side of that weird lake, whose memory will be like an inspiration to me till my dying day.

Had we known it, we could have hired a sailing-boat and gone a much shorter journey by the other side of the island. As it was, after a ride of twenty-seven miles, we left our horses when the ascent of the mountain—four thousand feet, as high as Snowdon—became impracticable for them, and toiled on foot six miles more—thirty-three in all to get there, and thirty-three to return.

Up and down, up and down—down, only to have to ascend the more afterwards—we plodded; while William's very new riding-boots were reducing his heels to something like pulp. Brave little William! It went to my heart to refuse him a drink of the last table-spoonful of water in my flask on the summit. I wanted it for my water-colour sketch.

Up through luxuriant forest for two hours did

a negro guide lead us, and then came a region wild and windy, cool and rainy, treeless, but lavishly clothed with ferns, with small red-blossoming scrub, and rich grass, whose broad blades are coated underneath with a silvery powder that comes off to the touch. Beneath were yielding cinders, and before us somewhat unyielding black snakes, which offered to dispute the passage; but though they bite, they are not poisonous. From the skirts of the forest there arose, clear and sad, the oft-repeated song of some wild bird, singing in perfect tune—

Two huge flat oval slabs—say two hundred feet long and thirty high, bedecked with a wild profusion of ferns—stand as twin sentinels of the chasm from which they were blown; and then it is but a step and the whole marvel of the volcano bursts upon you at once, not spoiled, as so many fine sights are, by being given to you in instalments beforehand. Oh the rapture of that sight!—the lake of brimstone-and-water shimmering more than a thousand feet below in the bright sunshine, with gleams of an incredible grass-green upon its bosom, and waves crested with snowy foam advancing dead against the wind, while never a whisper of their distant breaking reaches the ear; and all the stupendous sides that drop sheer into the fearful abyss are one glorious fernery, broken for about a mile on the south by a forest of small trees, all leafless, black as ink and dead; telling that it is not always peace here, and that the giant who has roused himself so lately to work this havoc may wake again.

Yes! his lair is overlaid with a fair memorial circlet of ferns, ever fresh and green; and here where the furious fires roared, where the red molten flood seethed forth, and huge rocks were shot up like so many pebbles into the sky, while the earth trembled with the thunder of the explosions—here there seems to be a funeral wreath deposited on the grave of a departed giant; but write no epitaph thereon, for if any were written it should be *Resurgam*, 'I shall rise again.'

The new crater has a smooth bottom of grass higher in level than the lake; and a triangular pond of transparent water, fed by a tiny stream, lies toward its eastern margin; but its sides are for the most part black and charred. We tried to pass between the two craters, but when midway, encountered a cloud coming on with such a furious charge and such a hurricane behind it, that we had to lie down to avoid being blown off the narrow ridge into the lake, a fate which we barely escaped. I have heard that 'the Indians'—that is, Caribs, who in 1735 numbered over ten thousand, but by the census of 1881 only one hundred and ninety-two—use this passage as a short-cut in carrying fish from the leeward coast; and there certainly seemed to be some trace of a path as far as we got; but even if I saw the thing done, I am not sure that I should accept the testimony of my own eyes.

We lay on the ridge until the storm abated; and glad men were we when that took place, and the fierce wind and rain and the dense fog cleared off enough to let us get back to safer ground. Thence we obtained a view of magic

beauty over the farther rim of the new crater. It was the Morne Garon, rising into the clouds from a verdant plateau intersected by a zigzag river. The perpendicular wall which the Morne presented to us was scalloped into vertical columns, across which ran alternate strata of bare dripping purple rock and vivid verdure of luxuriant ferns.

And now came the hour of reluctant adieu. One mile, and we had left the cool and rainy region behind, and were in the burning tropics again. But many miles were before us ere we could return to our ship; and it was not till three o'clock in the morning that, with the delightful sense of 'something attempted, something done,' we stretched our wearied limbs, I in my bunk, William in his hammock, to wake four hours later to a stiffness never experienced before, and to the indignant consciousness that every one laughed at us, and no one believed that we had really been to the Soufrière.

THE BURDEN OF ISABEL.*

CHAPTER XXXI.—ISABEL IS WAITED FOR.

'No woman can help him and guide him better than you.'

Isabel repeated these words again and again, with a certain solemnity, the morning after she had first read them, and every time she repeated them she murmured, 'There is no mention of Love.' She was going to surrender her wealth—that idea was still vividly present with her—out of love and gratitude to her uncle and his family: must she now also surrender herself? The passion of sacrifice was, as I have said, strong upon her; but yet she was not then fully prepared to make the second surrender that seemed to be due from her. She felt herself drifting into contemplation of its possibility, because, though strenuously confident the evening before, she was now very doubtful of holding on to the hopes Alan Ainsworth had created.

She went to the Home of her Aged, and partook of lunch with them; then she drove to Victoria Station to take train for the Surrey hills to visit her father. The day was bright and warm, and she found him enjoying the December sun on a southward slope of the grounds of his abode, with a blotting-pad upon his knee, busy with pen and paper and a bagman's ink-pot. He was so engrossed with his 'Defence of Transcendentalism' that he had little to say to his daughter, and presently she left him.

When she returned to town, she found a letter awaiting her from George, in answer to her own. He wrote absolutely a lover's letter; he could not (he said) possibly be offended by anything she might say to him: it was the ambition of his life to have her always saying all kinds of things to him; he was running some risk, of course; all business was surrounded with risks; but he had no fear of results, and what he was doing was entirely for her: he was only striving to have a fit provision for her on the day when she would answer him and put her hand in his,

he hoped. Would she not come down at Christmas? He was expecting her.—That generous and confident epistle necessarily had its effect. It toned down her anxiety about her uncle's future, and it rendered the prospect of obedience to what she regarded as Uncle Harry's dying request a trifle more possible and attractive. The attention and attitude of her mind were still further changed that evening. She dined at her uncle's again—this time it was a literary dinner—and her uncle was so jovial and seemed so void of care, and the affairs of the household seemed to be so much on their usual generous basis, that—taking also into account George's letter—she felt that she had been somewhat 'previous'—as our American cousins pleasantly say—in her passion of concern about her uncle's affairs. 'How absurd of me!' she thought, 'to be so very fast! I believe there is nothing wrong at all!' And the more inclined she had been to think ruin at hand, the less inclined was she now to believe there was any likelihood of ruin: it was the natural reaction of strong feeling and vivid fancy.

But the most moving thing for her was the presence of Alan Ainsworth. Her heart leaped on seeing him, regardless of all considerations of neglect, forgetfulness, or misapprehension, and then it went out to him when she noted how pale and thin he looked, as if worn with work and sleeplessness.

'You look ill,' said she. 'Have you been working very hard?'

'He's not burning the candle at both ends,' said her uncle with a laugh.—'but he's fair melting it, like th' lad that put his farthing dip into th' oven to keep it warm. He's shutting himself up too much with his writing. This is th' first time I've seen him for months, I think.'

'What is the reason?' asked Isabel with anxiety. 'Is it the play that has been wearing you out? How is it going? Why don't you read it to me? I am sure I could help you with suggestions. I think I might be at least as useful as Molière's housekeeper or Dumas' fireman. You might try it on me as one of the average public, and if I went to sleep or slipped away, you would know that that particular passage would not do.'

'You would be of no use, Miss Raynor,' said he very soberly: was he cold to her, she wondered, or was he only tired?—'as a representative of the average public, I am sorry—and at the same time glad—to say. You would be too critical; you wouldn't be content to let my effects touch you or move you: you would want to know how the effects were produced; and if they didn't touch you, you would want to examine why they didn't. Altogether, you would be too curious, Miss Raynor, and would wish to take the machinery to pieces.'

'There's a character to give me!' exclaimed Isabel to her uncle, 'which, he says, he is both glad and sorry to give!'

She spoke lightly, but she was deeply hurt by his words and by his manner of saying them: if his eyes rested on her an instant, they wandered away again, as if in search of another with whom he had rather be talking. That was in the drawing-room before dinner; and later, she was

more deeply hurt still. At dinner she did not sit near Ainsworth, but afterwards they came together without his appearing to seek the encounter. They had an opportunity for confidential talk, of which he did not avail himself. Indeed, he spoke to her little more intimately than to a casual acquaintance.

'Are you very well?' he said.

'Oh yes,' said she in some surprise; 'I am very well.'

'I hope your father is getting on well,' he went on: 'I haven't been able to go to see him for some time.'

'Yes,' she answered; 'my father, I am thankful to say, is going on very well. He is entirely taken up,' she added with a smile, 'with his "Defence of Transcendentalism."'

Her smile was unavoidably accompanied by a wistful look of wonder concerning the meaning of this farce of conversation between them. He caught her look, and turned pale even to the lips, while she flushed with a burning glow. There was an awkward pause.

'Are you going to Lancashire for Christmas?' he asked presently with the merest politeness.

'I don't know,' she answered. 'I mean, I have not yet decided.'

Then her uncle came along, and Ainsworth left her and went and talked with Miss Bruno the novelist, who, Isabel could see, received him with marked pleasure. Isabel was not only deeply wounded; she was ashamed and angry. Her bosom heaved in a turmoil of amazement, disappointment, and jealousy, so that she had to move away and compose herself alone.

Why did Ainsworth behave thus? The fact was he was afraid to trust himself in Isabel's presence. He had to put a constraint upon himself, lest he should pour out what he longed to say, but for which the time was not yet come. Had he then uttered what was in his heart, what had once and again risen almost to his lips, much pain and stress of feeling might have been spared both to Isabel and to himself. But he held his tongue and he went away because he had pledged his word to himself that he would not ask Isabel to say 'Yea' or 'Nay' until after a certain event had taken place. The event was ripe, but it had not yet dropped. His play was ready, that is to say, and had been accepted for speedy trial: it was to be put into rehearsal at once, and to be produced if possible on Christmas Eve. The manager of the theatre, however, had promised only an afternoon performance, seeing that the play was by a 'prentice hand'; but Ainsworth was grateful for even that: it was, for a beginner, a chance in a thousand; and he had the assurance that if the play were successful, it would go at once into the evening bill: if it were not successful—it would be relegated to the limbo of plays damned and events forgotten. Taking these things into account, he had resolved that the name of the author should be suppressed, and that none but those immediately concerned—Alexander, the manager, and the company of actors—should know who the author was. Therefore, he said nothing of the production to Isabel or the Suffields: if it failed, they would be none the wiser; and if it succeeded, they would know in good time.

Next day his rehearsals began, and what with

these and his newspaper duties he was occupied day and night until the date of the play's production; so no further word had he the opportunity of saying to Isabel, until it was too late—almost.

Meanwhile, Isabel went in and out as heretofore, and seemed to the general eye as bright and charming, and as much mistress of herself as she had been wont to be. But her heart was sorely vexed. She had almost forgotten the rumours of evil likely to happen to her uncle, and she could therefore be more occupied with her own intimate affairs. She had ceased to be very angry with Alan Ainsworth, but she was still surprised and disappointed. She tried to find excuses for him—explanations even—but she succeeded very ill. She had thought that he had held aloof from her as a woman whom it was not for him to woo because of her wealth, and she had attempted to show him till she was ashamed that in that regard her wealth was nothing to her: she had done that from the first. Now she desperately concluded that, if he cared for her at all, he cared, as she had at first thought, with a friendly interest merely, and by no means with an overpowering love. Perhaps the impulsiveness of his nature made his friendships with women appear warmer than they really were; at any rate in her case he obviously had no intention of urging that his friendship should be given the complexion of love. It might be, she thought humbly, she was not the kind of woman to inspire a man like Ainsworth with a passion.

In this soreness and disappointment of heart, she turned with an agreeable sense of comfort to the frank and generous regard which George had for her—with, indeed, something like relief and gratitude. She perfectly understood the question in his letter concerning Christmas. Should she go down to the old hall, then, that had long been as a home to her, and please George, please her uncle and aunt—she knew it would please her aunt now—and please the spirit of Uncle Harry, if he still knew aught of what passed on the earth which had not been too kind to him? Did she love George? She could not declare to herself that she did; but, after all, few people who married seemed to be very much in love. She could say—as Euphemia said of her lover—'He is very fond of me;' but she could not find that so satisfying as Euphemia seemed to find it. For she was not of the passive kind of woman who find it enough to be appreciated and loved: she was of the rarer kind who must themselves love and appreciate. Yet she admired George's manly and masterful qualities, she respected him, and she certainly liked him. He was not the kind of man she had dreamed she would marry; but still—still, how many women married their dream, or even their first love? And so—and so she obfuscated her true sense of things, darkened her usually clear vision, put her hands before the eyes of heart and soul, and determined she would go down to Lancashire at Christmas.

And in the halls of the Suffields she was anxiously awaited on the day before Christmas Day. George had confided his secret and his anxiety to his mother; and his mother, in motherly fashion, became anxious too: when she had last seen Isabel, she could not get her to

promise to come north, and she did not profess to be able to forecast or to tell what Isabel would do.

'I am sorry, my boy,' said she, 'that I cannot give you any comfort. But I know Isabel too well to venture to say what view she may take of it. She likes you, I am sure—she has shown she does—but whether she thinks she likes you well enough . . . Bell has notions of her own that there is no reckoning with. I used to think that she and Alan Ainsworth took very much to each other; but I know she has seen little of him for months, since, I believe, she came into Uncle Harry's money.'

George's father observed that his son would not sit down, and that he fidgeted about from room to room, and tramped in and out and considered the weather and looked at railway time-tables. 'What's th' matter wi' th' lad?' he asked his wife. 'He's as restless as a cat on hot bricks!'

Then his wife disclosed to him the secret of the cause. He pursed his lips, nodded twice, and went and laid his hand on his son's shoulder. 'Thy mother,' said he, 'has told me, lad. Keep thy pecker up, and never say die—and put thy trust i' th' Lord.' Suffield seldom used religious phrases in his ordinary speech, but when he did use them he used them with simplicity.

'All right, dad—all right,' said George, grasping his father's hand.

Euphemia, of course, had guessed the secret already, and had her own view—which she kept to herself—of the issue. Thus the whole household waited, and watched the clock, and considered the arrival of trains. They did not enter upon this acute condition of waiting until after luncheon; for no train leaving London at a reasonable hour could arrive until about half-past two, and then there was the little appendix of a journey out of town to be reckoned. But when luncheon was past, expectation was rendered feverish by the railway time-tables. The Suffields were in the habit of travelling by one particular line, and they knew that by that there arrived an available train almost every hour up till about ten at night. There are, however, three great railways from London into Lancashire, and when they came to examine the time-tables of all three in *Bradshaw*, the total number of suggested trains—one train arriving on the heels of another, or outstripping another, all the day long—made their heads whirl. All but George then gave up the time-tables in despair and waited with resignation. He openly made out a list in three parallel columns of all the trains and then put the list in his pocket.

'I would go and meet her at the station,' said he, 'but she might come by the road.'

He went out, therefore, and hung about between two points of vantage in the park, whence he could command a sweeping view of the road on the one hand and of the path from the local station on the other. There were tense occasions when, with his list in his hand and his knowledge of the distance from town in his head, he could lay his finger on a narrow margin of minutes and say: 'If she came by *that* train, she should arrive about now.' But she did not arrive, and George still waited and hovered to and fro.

His father had wandered into the village to gossip with some of the old folk about their colds, their rheumatisms, and their asthmas; but his mother and sister sympathetically observed him from the windows of the drawing-room.

'Brother George, brother George!' murmured Euphemia in one window, where she sat with a neglected novel in her lap, 'do you see anybody coming?'

'You should not make game of your brother, Phemy,' said her mother from the other window. 'We shouldn't watch him like this, poor lad!' And she rose and walked into the depths of the room. 'It seems like sacrilege. We should be ashamed.'

'Well, mother,' said Phemy, 'he shows how he feels very publicly.'

'It's his nature, my dear,' said her mother proudly, 'to do everything openly.'

'He must be very fond of Bell,' said Phemy—'fonder than I thought he was. I'm sure Clitheroe never waited about like that for me!'

So it wore on till tea-time and dark. When tea was brought in, Phemy called her brother, and he came. But he would not sit down: he swallowed cups of tea, tramped about the room, and looked out of window.

'Happen,' said his father, who had returned from the village charged with news to which his wife gave but a preoccupied ear—'happen she thought she'd have lunch first—and I don't blame her—and then she'd catch that train at two—the best train of the day: it gets you here in plenty of time to get ready for dinner. That's the way to travel: from a good meal to a good meal; then you're not too tired by your journey.'

'Bell likes her meals good and regular,' said Phemy.

'Her school-life,' said Mrs Suffield, 'got her into the habit of having everything regular and up to time.'

'Bell is the only woman I know—except mother,' said George—'that can appreciate the whole of a good dinner. Most women don't care what's set before them: they seem always to prefer tea and talk!—Tea and talk!' he exclaimed with great contempt.

'Quite so, my lad,' said his father. 'And it's very bad for them; but they won't believe it.'

'Isabel,' said Mrs Suffield, 'knows what's what: I must say that for her. She eats well and wisely. She knows that good food makes good blood; and that good blood means good life for herself, and the chance of good life for her children after her—if she has any.'

Upon that all were silent, and George went out again—though it was dark—to his sentry-duty between the two points. But still Isabel came not—came not even by the train her uncle had reckoned upon her taking—and the dark became illumined by the moon, and the stars twinkled to see George still at his post. When the moon covered all things with her mystic light, George went in and dressed for dinner. Train still succeeded train on his list, racing madly with each other: she might arrive just before, or just at, or a little after the dinner-hour. Dinner was put back to await her, and they all sat—all save George, who hung about out of doors with an ear for every sound—all three

sat, dressed, hungry and silent, in the drawing-room.

'He'll get his shirt-front spoiled with the damp,' said Mrs Suffield; 'and those birds will be done to rags with waiting!'

Phemy laughed, and her mother frowned, and the mantel-clock struck half-past eight.

'Let's have dinner in, Joan,' said Suffield. 'She has very likely arranged to come by the dining-car express.'

'There are three of them on the different lines,' said his son, who had just entered, 'all within ten minutes of each other.'

So they went to dinner, and ate it with little gaiety or enjoyment.

'If she doesn't come by one of those three,' said George, striving to make up his mind to a definite conclusion, 'she won't come to-night.'

'Oh,' said his father. 'Then we can go to bed when we want to. She won't come till to-morrow now—if she come—and to-morrow's a bad day for travelling.—What did you say about coming when you wrote to her, lad?'

'I didn't expressly invite her,' answered George with a blush. 'I just asked her if she was coming.'

'Oh—in that case,' said his father, 'happen she doesn't mean to come—not that I mean to put you out of heart, my lad,' he added hurriedly; for George had turned very pale and had pulled his brows together. 'But, well—there you are, you know.'

'If she had not meant to come, she would have written that she was not coming,' said Mrs Suffield decisively.

'Don't let us discuss it, mother,' said George.

Isabel did not come; it was past eleven, and all were thinking gloomily of bed, when old Tummas, the butler—Daniel was gone for a holiday—entered with what he called a 'tally-graft': it had just been brought to the back-door by a special messenger. George tore it open. 'Am coming by night-train,' he read aloud; 'shall be with you early in the morning.—ISABEL.'

'The night-train!' exclaimed Mrs Suffield. 'It is not very seemly for a young lady to travel by night!'

'Oh, it's all right, mother,' said George cheerfully; and it was only now when it disappeared that the weight of his anxiety became apparent. 'Though you know well enough that when she wants to do a thing, Isabel is not the one to think whether it is seemly or not.—The trouble, however, is,' said he, with a laugh, 'that she doesn't say which night-train: there are three of them, as of the others!'

'Ah,' said his father, 'I've had quite an education to-day in trains: I had no idea that there was such a big, three-cornered competition, and that there could be so many people wanting to run up and down between this and London!'

George consulted his time-tables again, and took his resolution, and went out for a little to give an order to one of the grooms; and then they all went to bed.

At three o'clock on Christmas morning, in the dead, cold waste of what was still night, George Suffield stole softly away in a dogcart, like a midnight marauder. He had told no one his errand; and he drove on softly on the grass till

he thought he was out of ear-shot of the house, when he flicked his mare with the whip, saying, 'Now, my girl,' and dashed away out of the dark and down the high-road leading to town. He was going to meet Isabel. He would wait for first one night-train and then another until she came, until he saw her coming forth to greet him, 'fair as the moon, clear as the sun, and terrible as an army with banners.' In truth he trembled at the mere thought of meeting her alone—trembled, half with joy, wholly with expectation. Did she, or did she not, understand how he would interpret her coming? Did she *quite* understand?

The first train arrived at four o'clock at one station, laden with jovial passengers. But Isabel was not in that train. The next train arrived at a little past five at another station, and thither George leisurely drove to wait. Slowly, with leaden feet, the minutes and the quarters passed, but at length the engine glided into the station and ceased its motion with a great sigh. George singled out the Ladies' Sleeping Car, and just as he reached the door, Isabel stepped out upon the platform. Not many ladies could have borne the ordeal of being thus seen immediately at the end of a cold night journey; but Isabel could bear it better than most, and it was not the consciousness of being seen under untoward conditions that made her blush so deeply as she did.

'So, Bell,' said George, grasping her hand and embracing it with both his, 'you have come.'

'Yes, George,' said she; 'I have come.'

WHAT IS A BUCKET-SHOP?

AMONG the many 'notions' of dubious morality and more than dubious utility which we have imported from America, along with corners and watered stocks, is the Bucket-shop. This is a peculiarly American institution, which has only of late years found an abiding-place among us, and that not to any great extent outside of London. It may be that there are establishments on the Bucket-shop principle in Manchester, Liverpool, and Glasgow; but they have not the unblushing hardihood and heedless 'go' of the American and London establishments.

The term Bucket-shop is now primarily, if not exclusively, applied to an unlicensed and unauthorised office for gambling in stocks and shares. It is quite applicable, however, to any office for minor speculation in anything, conducted as an open gamble.

Indeed, the Bucket-shop is said to have originated in the grain-trade of Chicago, and one story of its origin is this. Some years ago, the Board of Trade—not a Government department, but in reality the Bourse, or Exchange—of Chicago laid down the regulation that the dealings in 'Options'—which have been already explained in this *Journal*—should not be for smaller quantities than five thousand bushels. This not only choked off the small speculators, but also seriously affected the business of those brokers and dealers who had cultivated clients of small means. To overcome this regulation, a sort of Petite Bourse, outside Exchange, or open Board of Trade, was started in a room under the regular Board of Trade room. For facility of intercourse,

a lift was by-and-by introduced; and in dull times a member of the larger room would offer to send down to the smaller room for a bucketful of small 'options' to keep things moving.

This is one explanation of how the term came to be applied to an office for small gambles in grain. We are not quite satisfied with it, however, and the term Bucket-shop was probably applied to the open Board of Trade by some singed moth or other. To 'bucket' is an old slang term for to 'cheat' or 'swindle.' It occurs in Vaux's 'Flash Dictionary' (1812), and is made use of by Sir Walter Scott in his *Diary* (1828), as if it were then a well-known phrase.

Then, again, to 'bucket' is to ride a horse recklessly; and in rowing, to 'bucket' is to turn the body forward too eagerly, preparatory to taking the stroke—another form of heedlessness. An old French word corrupted into 'bucket' gave name to a beam on which anything may be hung for carrying, such as a slaughtered sheep strung up by the heels. It is from this word that we have the slang phrase to 'kick the bucket;' and it is not extravagant to imagine some suggestion of the operation to the fertile mind which had invented the name of Bucket-shop. And finally, the word 'buck' is, according to Hotten's 'Slang Dictionary,' applied both to an unlicensed cabman and to a sixpence, from which an easy transition would make 'bucket' unlicensed dealing in small operations. From any one of these suggestions, a more reasonable theory of origin seems to us deducible, than from the somewhat strained story of the 'bucketful' of orders from the outside shop.

However originated, the term Bucket-shop is no longer confined to offices for small gambling in grain, but is applied to places in which a regular business is conducted, not for dealing in, but for betting on, stocks and shares. As a rule, the Bucket-shop keeper makes his own prices, approximating, of course, to those of the Exchange, so as to include what he calls his commission, and he makes them 'wide' enough to ensure his own safety, however the market goes. Bucket-shop dealing has been called thimble-rigging in stocks. This is, perhaps, too sweeping a definition, because, although the Bucket-shop is a foolish and improper institution, all Bucket-shop keepers are not deliberate swindlers. In fact, some of them are as straightforward and honest as the best class of bookmakers on races; but all the same, like the bookmakers, they flourish on the follies of the public; and like the keeper of a roulette table, they have all the odds in their favour. As in all gambling, there is both honesty and cheating in Bucket-shops; but in any case it is gambling pure and simple.

It is necessary to discriminate between speculation and gambling, and to get rid of the popular delusion that buying and selling on the Stock Exchange is not legitimate business. While we are not at present considering the ethics of speculation, we must ask the reader to remember that there is a wide difference between buying and selling a commodity or security 'for the rise' or 'for the fall,' and merely betting on the chances of a rise or a fall. The speculative buyer or seller must, if required, either take or deliver what he has bought or sold, and the transaction is regulated, recorded, and completed, as a regular

business transaction on recognised business principles. In the Stock Exchange, it is true that all the stocks and shares which are daily bought and sold do not daily change hands, but at the end of the 'account' pass from the last sellers to the last buyers, while the intermediaries settle their differences. Leaving these intricacies in the meantime, however, what we wish to make clear is that on the Stock Exchange definite commodities—that is, public securities—are dealt in, but in the Bucket-shops only *chances* are dealt in.

The frequenter of a Bucket-shop does not either buy or sell the stocks, nor does the keeper of it intend that he should. He simply bets on the rise or fall of a price, and in doing so deposits, or stipulates to pay, a 'margin,' which is just the same as tabling the stakes in a bet. The ultimate result of the operation depends more or less—but not more than the Bucket-shop keeper can help—on the movements of the stock markets, and thus the Bucket-shop is really an addendum to the Stock Exchange; or, as it was originally in Chicago, of the wheat-pit. But it is a parasite, an unsightly and unwholesome growth, which is abhorred by the legitimate dealer.

And one reason for his abhorrence is that the shocking reputation of Bucket-shops, and the evil experience of those who have resorted to them, have done a great deal to discredit legitimate dealing in properly constituted Exchanges. The idea is apt to prevail among persons of limited knowledge that, because the Bucket-shop is an office for gambling in stocks, all speculating in stocks is reckless gambling. Let it be clearly understood, therefore, that although the Bucket-shop hangs on to the Exchange and uses the quotations and terms of the Exchange, it is not a portion of, but is indignantly disowned by, the Exchange.

Another reason for the abhorrence of dealers is that whereas the members of the regular Stock Exchanges in this country are forbidden to advertise, the Bucket-shop keepers advertise far and wide, and attract into their parlours many an unwary fly who might otherwise have found his way to the legitimate avenues of the kind of business in which he was desirous of embarking.

We do not say, of course, that all stockbrokers who advertise are Bucket-shop keepers. There is no particular saving grace in membership, but only a certain assurance of respectability and honour. There are numbers of men known as 'outside brokers' quite as respectable and honourable as those within the magic circle, and who are only 'outside' because of some former misfortune or technical disability. To these 'outside brokers' it is quite open to advertise for business, which, moreover, they conclude within the precincts of the Exchange through a member with whom they arrange to divide their commissions.

A bonâ-fide 'outside broker' conducts bonâ-fide business in the same manner and on the same principles—except that he advertises—as a member of the Room. The Bucket-shop keeper, who also advertises, is not a broker, but a principal, like the croupier of the roulette table.

A broker is an agent whose interest is identical with that of his principal. A Bucket-shop

keeper's interest is exactly the reverse of that of his client.

Prices on the Stock Exchange are 'made' by the rivalries of buyers and sellers, the incidence of politics, the pressure of commercial events, the movements of gold, and so on. In London it is the function of the 'jobbers' to make prices for the brokers—a jobber acting only for himself, and a broker only for his clients. Now, when a jobber is asked by a broker to make a price for any given stock, he names two figures, say '55—55½'—which means that he will buy at the lower or sell at the higher figure, not knowing whether the broker be wishing to buy or sell. In the competition of business, prices, especially of favourite stocks, or those most extensively and frequently dealt in, are made very 'close'—that is, with a very small fraction indeed between the buying and the selling rate, the fraction representing the jobber's profit if he closes the transaction both ways at once, as he endeavours to do. These quotations are marked up, and are telegraphed all over the country; but the quotations fluctuate from hour to hour, and even from jobber to jobber.

The Bucket-shop keeper has either a tape-machine or messengers to bring him the prices in a constant stream from the Exchange, where he must have some confederate *sub rosa*. What he practically says to his clients is that the market must go up or down, and he advises them to select a stock, or he indicates a stock, in which the probabilities are one way or the other, and to wager a certain sum that it will go up or down to a certain extent. Suppose, for instance, Caledonian Railway Stock be selected for the gamble—the 'client' will bet ten pounds that 'Caleys' will go up above a certain named price. He deposits the ten pounds; and if the price falls one per cent.—we are assuming the extent of the operation being of the usual one thousand pounds nominal stock—the Bucket-man 'closes,' as he calls it, and pockets the money. Some of them charge a commission on the transaction, but for the most part they include their commission in the so-called prices. It will be observed that while the client may choose his own time, if he be on the spot, to close the bet should the price go in his favour, he has no option should it go against him, the 'deal' being ended the moment the margin is absorbed.

It is easy enough for a clever and unscrupulous Bucket-man so to manipulate quotations as always to secure the margins. Or even if prices do go against him, it is very simple to put another customer on the opposite tack, and make the one balance the other, to his own advantage.

As far as the 'client' is concerned, it is all pure guess-work and downright gambling. He does not go into the market to stand the chance of buying or selling in the light of his own knowledge and experience, and so by his own action to help to produce the result he expects and desires. He does not want the stock he 'bills,' nor has he the stock he 'bears.' He knows and cares nothing about its real value, and he has not the slightest desire even to see the article he is professing to deal in. He merely wagers money on the chances of what other people, of whom he has no knowledge, will do.

These Bucket-shops are swarming all over the United States, but are, happily, not so common with us. This is how an American writer describes the *modus operandi* in his country:

'The Bucket-shop keeper exhibits to his visitors the current quotations of some regularly conducted Exchange, and if the patron of the shop thinks that the members of the Exchange will buy enough (say) Western Union to advance the price, he deposits ten dollars with the cashier of the Bucket-shop, and "buys" ten shares of Western Union at (say) 85 from its keeper, who stands ready either to buy or sell on the latest quotations from the patron. Here a margin of one per cent. is put up, and, unless otherwise stipulated, if the stock in the market on which they are betting goes down to 84½ or 84¼—depending on the "commission" charged—the patron's margin is exhausted and the game closed. Sometimes, if the standing of the patron is known, the Bucket-shop keeper will let the loss run against the customer a point or so more.'

This is a temptation to the gambler, who will let a loss run as long as the keeper will 'carry' him, which is just as far as the patron can be squeezed.

For the rest, says the same writer, these Bucket-shop keepers are 'Financial nomads, changing their firm-names and habitat to suit their pecuniary exigences. They belong to no association, are accountable to no authority, and the sums they owe to confiding customers are usually too small to justify an appeal to law; besides, many patrons would not like to advertise their dealings.'

That is the pity of it. Men get bitten, but suffer in silence and shame. Every dealer in a Bucket-shop is, in sporting phrase, betting against the bank, and is bound to get caught sooner or later.

Is there no law against them? Apparently none, except the law of common-sense. If people would only consider the utter absurdity of the prospects held out by the Bucket-shop keeper—the weak folly of believing that if the chances of picking up fortunes are such as he professes, he would not pick them up for himself—the Bucket-shops would have fewer dupes. And yet their victims are legion, especially among the class of clerks and small shopkeepers, and even of 'retired persons' of limited means. Let a man figure in the proprietary of any joint-stock company, or in any way be known as an investor, and he will be flooded with the prospectuses and false promises of the Bucket-shops.

Who does not know these invitations to entrust limited amounts—the advertiser is always wary enough not to frighten his prey with big risks—to the unlimited discretion of a person they never heard of before in connection with a stock they know nothing whatever about—with the certainty of making a fabulous percentage of profit without getting out of bed? Well, we have known many who have been tempted, but we never knew one who came out finally unsinged. For the gambler has all the chances of the market and all the wiles and artifices of the Bucket-shop against him.

The worst of the Bucket-shop is that it preserves the appearance of orthodox business. It is often carried on in a sumptuous establishment,

with business waiting-rooms for clients, and ample supplies of telegraph information and daily newspapers. With the general air and bustle of such an establishment the novice is easily impressed, as we may be with the showy grandeur of Monte Carlo. But he is not more certain to lose his money at Monte Carlo than he is in a Bucket-shop.

Then how is it that Bucket-shop keepers do not always and rapidly make fortunes? How is it that they are so frequently disappearing from human ken, and if not too industriously pursued by the police, are reappearing with new names in some other part of the city, or in some other town? For the most part because they are mere adventurers to begin with, and if they make a 'pile,' either 'slide' with it, or else gamble with it themselves and 'get left;' then they leave their shop and its customers, and the landlord seizes the furniture.

How many hearts have been broken and homes made miserable by the Bucket-shops will never be known. Let the reader avoid them as he would the dragon's teeth.

JOHN UPCRAFT'S CRIME.

CHAPTER IV.—AN EBBING LIFE.

WHEN the boy's words fell upon Jessie's ear she swayed to and fro; the lantern dropped from her grasp, and she sank to the ground with a sense of utter helplessness. It seemed to her that the lantern was going out, and that they were whirling into darkness. But gradually her dizziness left her, the light came back to her eyes, and she recognised Jim bending over her with the flaring lantern close to her face.

'Miss Jess!' he was crying, in a panic-stricken voice, 'don't lie there. You'll be run over. Don't you hear something a-coming along the road? Get up—do get up!'

The tramp of horses could certainly be heard upon the hard road. Jess rose to her feet with Jim's assistance; and she had scarcely reached the side-path when two blurred lights were seen approaching through the mist.

'It's from the Hall,' said Jim. 'It's Colonel Woodward's carriage; shall I call out?'

'Yes.'

Jim waved the lantern and uttered a shrill cry. The carriage came to a stand-still, and a gentleman stepped out. 'Colonel Woodward!'

He was a strongly-built man of forty or forty-five. He had a kindly face; and as he held out his hand to Jess, spoke in a deep earnest voice. 'I was on my way to the cottage,' said he. 'We want your help, Miss Bryce. We are in great trouble at the Hall. A young fellow has been struck down in Thurrock Wood. He's not dead; but I fear he's dying. Everything is being done, however, to save his life. We only need a trained nurse. Will you come?'

Jess answered eagerly: 'I will go with you now!' She spoke a hurried word to Jim, exchanging with him a meaning look, and then stepped into the carriage. Colonel Woodward took the place at her side, and they drove back to Thurrock Hall as quickly as it was possible on such a night.

Jess almost dreaded to speak as they went along, lest her voice should betray her intense agitation. In one moment the whole outlook had been changed. He was dying! Had she waited three years, and hoped against hope, only for this? How strange that Woodward should have come for her! She could no longer resist the question: 'Who is he?'

'Nobody knows,' said Woodward; 'and nothing has been found to identify him. He has not been robbed. A leathern case containing some bank-notes was found in a side-pocket. The whole thing is a mystery.—What can have prompted the crime?'

A dreadful thought occurred to Jess. 'Is it not possible,' said she, 'that the blow was self-inflicted?'

'The doctor thinks not,' said Woodward. 'It is one of the most incomprehensible attempts at murder, he declares, that he has ever heard of.'

Jess sank back in the carriage. She wondered who could have done so cruel a deed? It seemed to her that John Upcraft was surrounded by enemies. And yet she knew, for her own heart told her so, that John had never done any one an intentional wrong.

A lengthy drive through the dark, leafless avenue brought them to the principal entrance to Thurrock Hall, with its lofty portico, reached by a broad flight of steps. What a contrast this mansion was, compared with the six-roomed cottage down in the marshlands! The great hall, with its oaken staircase beyond; the library, the suite of reception rooms, the long picture-gallery above. Every room was well known to Jess; for she had been a frequent visitor at the Hall for years past.

The Colonel led the way up-stairs.

The injured man was lying upon a bed in one of the spare rooms, quite motionless. Jess approached the bedside and looked into his face. Three years had greatly changed him. She could scarcely believe that this was the John Upcraft she had known in better days. There were lines of care that told how deeply he had suffered. For a moment she thought him dead: he was livid, and hardly seemed to breathe. The colour went from her face while she looked. Woodward was standing at her side, watching her every movement, seemingly with more concern for her than for the patient.

'Are you faint?' said he.

'It's nothing,' said Jess. 'I'—

He hastened to reach a chair for her, and she sank down with a sense of hopelessness and despair, which she could hide no longer.

Woodward went in search of his sister; and presently Miss Woodward came in with some tea. She was not unlike her brother, though graver in look. She had lived many years at Thurrock Hall; and since her brother had retired from the army, she had kept house for him here. Something in her look and tone, at times, had made Jess wonder if she had ever experienced a great sorrow. It seemed to her as though some painful romance had cast a shadow over Miss Woodward's life in days gone by, and had left its traces upon her face.

'Shall I sit with him to-night?' said she, looking sympathetically at Jess. 'You look so tired.'

No suggestion could have roused Jess more thoroughly out of herself. 'Indeed, I'm not,' said she; 'I'm quite rested now!'

When the household at Thurrock Hall had retired, and Jess found herself alone at the bedside, she bent down over her patient with a great joy at her heart. She was near him once more. There he lay, between life and death; no look of recognition in his half-closed eyes, no word upon his lips, no utterance even of her name. But she was near him; that was some recompense after all these years; and a sense of gratitude, so long unknown to her, filled her whole being; and she found relief in tears at last.

He had constant medical care: the days went by; but without any promise of recovery. And now a new dread took a hold upon her. He would be recognised! How could that fatality be averted? She racked her brains in search of some loophole for escape from an avowal that she was nursing the man she loved—a hunted convict—and that his name was John Upercraft.

One thing, however, afforded Jess a great sense of relief during these anxious days. Her father, though he had returned from his unpremeditated visit to London, had kept away from Thurrock Hall. She knew that he had an almost morbid horror of being asked to give medical advice since he had gone into retreat. But was that sufficient to account for his apparent absence of all interest or sympathy concerning this trouble which had fallen upon the shoulders of his warm-hearted neighbour? But she offered no comment, even to Woodward. Her father's name, indeed, never escaped her; for she fully realised that the moment he entered the sick-room the secret, which she was scheming every hour in the day to preserve, would be blurted out. Her one hope was that Upercraft would regain strength enough to quit the Hall before her father showed the least sign of making his appearance.

At last Upercraft began to give some indications of recovery; and one night, when Jess was alone beside him, he recognised her for the first time. She was drowsy from many hours of vigil when she heard him murmuring her name: 'Jess!'

She went to the bedside and bent over him: 'Dear John! Do you know me?'

He moved his head feverishly from one side to the other. 'I wish that boy would take the lantern away,' said he. 'It blinds me. Will you help me up? I can walk now. What a shivering fit I've got from lying here so long! No; don't put your cloak over me. I shall soon get warm. Is that the light in the cottage window? Help me up! There's the gun firing again.'

She took his hand and spoke a soothing word in his ear. For a while he lay silent, looking towards the cheerful fire, the only light in the room, except a little hand-lamp which Jess had placed out of sight. 'How bright and warm it is,' he presently went on in a changed tone. 'When I've washed this mud off my face and hands'—He raised his eyes to Jessie's face while speaking; and then a look of recognition gradually came into his face. 'Jess—am I dreaming?'

'No, dear; you are awake now.'

'Am I?' said he, looking about him doubtfully.

'Why, this is not the cottage! If I am awake, tell me how I come to be lying here?'

'This is Thurrock Hall,' said Jess, 'and you have been ill—very ill.'

Then she told him in a few words what had happened. When she had finished, he lay for a long time silent and thoughtful. Then he said, as if questioning himself rather than Jess: 'Who has done this?'

'It's not known,' said the girl; 'but Colonel Woodward, who is an active magistrate, is making a thorough investigation.'

Presently Upercraft fell into a sound sleep. Jess took a seat by the fire; but she no longer felt drowsy. She began to wonder whether John would approve of her action in keeping his identity concealed from her friends at Thurrock Hall. Her father, as she still dreaded, might walk into the sick-room at any moment. She resolved to speak of this to John as soon as he was strong enough, and be guided by his decision.

When Upercraft awoke an hour or two later, he looked eagerly at Jess, and said: 'Give me time—a day or two—and it will all come back to me!'

'Of what are you speaking, John?'

'All that happened in Thurrock Wood,' said he. 'I was dreaming about it just now. It was bitterly cold that night, and the footpath was frozen hard. I heard a step coming up behind me a long way off. I thought I recognised it. Whose could it have been? I can't remember! But I remember turning with his name on the tip of my tongue, when I was struck down. That blow has blotted out the name!' He again fell into a thoughtful mood. At last he said: 'If I were to hear the footstep, hear it only once, the name would come back to me. I wonder, shall I ever hear it again?'

Jess made no reply. She was intensely interested in all he was saying; but she feared to encourage any talk; and after a while he fell asleep once more, and did not wake till day-break.

One afternoon, a few days later, Miss Woodward—almost as conscientious a nurse in the sick-room as Jess herself—came in to relieve her for a while. Colonel Woodward appeared a moment after her. 'Come, Miss Bryce,' said he, 'let us go for a brisk walk across the home park; what do you say?'

'I am always ready for a brisk walk,' said Jess, with a sense of her old sprightliness coming back now that Upercraft was out of danger. If Woodward had asked her to dance with him down the avenue, she would have hardly refused.

At first, their walk was brisk enough, even for Jess. They both felt a healthful glow as they went along in the face of a keen north wind. But after a while, turning into a pathway under an avenue of elms, they began to slacken their pace, for Jess was getting out of breath. Her lips were slightly parted, and her cheeks had gained quite a rosy hue.

Woodward bent his eyes earnestly upon her face. 'I have often wished,' said he, 'that I could see you looking more cheerful; and you begin to look so to-day—more yourself! I know

how you have suffered. I learned about your trouble long ago; and I have felt so sorry for you.—Do I pain you? I want you to think of me as your friend.

She had long known that Woodward cared for her far more than she could have desired. She knew also, only too well, that her father had never ceased to do his best to bring about a match between them. But since Woodward was some years her senior, and knew of her engagement to Upcraft, she hoped that in time his untold love might turn to friendship. She had always felt a great affection for him. He had been a true friend to her and to her father for many years; and the thought of shunning him had never entered her head. But she almost wished that she had done so now; for she had no desire except for his happiness. She could realise, as she had never been able to realise before, what a hopeless passion must be, and her sympathy was seriously awakened. She was too deeply moved to speak; she could only thank him with a look of gratitude: she felt what avowal must follow such condoling words!

The afternoon had become overcast. An occasional snow-flake sifted through the black branches of the elm-trees over their heads. They had turned their steps towards home before Woodward resumed: 'I should be the last to ask you,' said he, 'to put this trouble out of your thoughts. That I know would be impossible. But if you will give me the right to share your thoughts with you, Jess, I will do my best to bring at least a gleam of happiness into your life.'

He saw a feathery flake touch a ringlet of her dark hair; another alighted on her lashes as if it were a frosty tear. And then the snow began to fall in earnest, and they hastened on their way. The white flakes whirled about them in blinding clouds, looking like flakes of soot against the stormy sky.

'It cannot - it can never be!'

Jess was sorely troubled. She now conceived how wrongly she had acted in keeping the knowledge of John's identity a dead secret. What would Colonel Woodward think of her when he learned the truth? She never imagined that she could be placed by one thoughtless deed in so distasteful a position. She could find no excuse that would fully justify her lack of moral courage to confide in him. It seemed to her at that moment as though she had questioned his honour. Would it not seem so to him?

The snow-flakes danced about them in the wind, looking like a swarm of pale, mischievous sprites that took delight in her discomfiture. She stopped and glanced up distressfully into Woodward's face. 'Oh, can't you understand?' said she, in a bewildered tone. 'I could not bring myself to speak of it, not even to you! For I had the horrible dread that it might reach my father's ears. It was this that prompted me to guard the secret. Try not to think ill of me. I've hardly been in my right senses, I fear, since all this happened. My one thought was to get him well, and away! And then I would have asked your forgiveness for my foolish mistrust of your sister and you.'

The playful snow-flakes rushed round them in maddening flights. Woodward leaned his back against the trunk of a great elm and regarded

Jessie distractedly, as though puzzled to decide whether she was in her right senses yet.

'The man whom you found nearly murdered in Thurrock Wood,' Jess went on, 'whom you brought to the Hall in your carriage—to whom you gave your hospitality, and have tended ever since like a friend—is none other than an escaped convict—the man I have loved for years—and his name is John Upcraft!'

The eager flakes caught up her words and fled with them, as if racing to be first to carry her secret to the four winds.

Woodward spoke no word. He silently gave Jess his arm, and they struggled on together in the face of the snow-storm towards the Hall.

They had ascended the terrace steps, and were crossing the terrace on their way to the front door, when Jess chanced to peer in at one of the library windows. On the hearth-rug in front of a bright fire stood her father. He was warming his hands at the blaze; and he smiled at them blandly over his shoulder as they hurried by.

Jess pressed more closely to Woodward's side; her fingers tightened upon his arm; and she turned as white as the snow-flakes that were beating against their faces. 'You'll not let my father see him, will you?' said she. There was terror in her look.

Woodward hastened to reassure her. 'But come to the library,' said he. 'Show yourself for a moment. You may then safely leave him to me.'

She followed Woodward tremulously. Her father was still standing over the fire and warming his hands, when they entered the room. 'Well,' said he, 'caught in the snow-storm, were you? So was I. It will be the death of me. I shall have to ask you to put me up to-night, Woodward. I dare not venture out again in this weather.'

Woodward turned away to hide his look of annoyance. 'You're always welcome, of course,' said he.

'So the patient is recovering, eh?' Mr Bryce went on, glancing at Jess. 'Miss Woodward can spare you now, can't she?'

'Not yet,' Woodward chimed in. 'The patient is out of danger; but we shan't be able to spare Jess for some days.'

Mr Bryce looked frowningly into the fire. 'Out of danger, is he?—Now, I wonder,' said he, in a slow, deliberate tone, 'I wonder if he has expressed any opinion—whether, in a word, he has been able to throw any light upon this mystery. It would be interesting to know'—

'He remembers nothing,' Jess interposed, 'except a step behind him—then the dreadful blow—nothing more.'

'Ah!' Mr Bryce nodded at the fire, and rubbed his hands cheerfully together. But he made no comment beyond this exclamation.

Jess gave Woodward a quick glance and went out. She found Miss Woodward seated at the bedside when she reached the sick-room. Upcraft had fallen asleep. 'My dear,' said Miss Woodward, looking anxiously into Jessie's face, 'you won't think me too curious, will you? But do tell me! Has he spoken to you? He told me he should speak to you to-day.—But you can't cast your love for that other one,' she hastened to

add—'the one you have lost—out of your heart, can you?'

Jessie shook her head. 'I have much to tell you,' said she.

'Ah! I was afraid,' Miss Woodward went on—'I was afraid it would prove to you a livelong grief! I pity you. Yes, only as a woman can pity, my dear, who has gone through all the misery herself.'

Miss Woodward had scarcely gone, when Upcraft opened his eyes. He raised himself and listened intently.

'What is it, dear?' said Jess.

'I've been dreaming again about that footstep in Thurrock Wood,' said he, with the listening look still in his eyes. 'Whose step can it have been?'

Upcraft lay awake, puzzling over this question. It was long past midnight; the household was hushed in sleep, and no sound reached him except an occasional gust of wind, or the soft pattering of the snow against the windows. The fire burned brightly in the darkened room, throwing weird shadows like threatening arms upon the walls. Jess had fallen asleep in a chair at the bedside, with an arm resting upon the bed, and her head resting upon her arm.

He had closed his eyes, half-dozing at last, when an approaching step in the corridor outside caught his ear. During some moments, Upcraft thought that he must be dreaming again; for the step exactly resembled the one he had heard in Thurrock Wood. He raised himself upon his elbow and cast a swift glance at Jess, to discover if the step had awakened her. No; she was sleeping soundly enough. He was half tempted to rouse her; the step might be a delusion—the lingering echo of the dream he had had a few hours ago. But he refrained; for each moment the step seemed to draw nearer; and then the name of him to whom the step belonged flashed upon his memory—the very blow that had fallen upon him seemed to repeat itself—and he sank back stupefied upon his pillow.

SOME LITERARY AMENITIES.

LITERATURE is a hobby that affords a varied round of pleasures. Besides those of reading, writing, thinking, critical gossip, and the genialities of your club gatherings, if you are so happy as to be a member of any such intellectual society, there is the exercise of your physical man in excursions among the bookshops and stalls. A lover of books will, unawares, tramp miles and go through quite a long course of calisthenics in a second-hand shop no larger than a boudoir, as he wanders to and fro scanning the shelves, ever and anon pulling down a volume and replacing it; to say nothing of his numerous scrambles up the shop-ladder in search of hid treasure. Then, too, the deeply interesting little chats on book-lore with the quaintly philosophical bookseller—whose favourite work is perhaps Boswell's 'Johnson,' which he knows by heart—are interspersed with the vagaries of all sorts and conditions of callers, from the Irish labourer who has mistaken the place for the Post-office half

a mile away, to the callow youth who, to our surprise, instead of asking for a sixpenny 'Robinson Crusoe' or a threepenny 'Midshipman Easy,' asks about the result of the afternoon's football match, seemingly under the impression that a man surrounded by so many books must assuredly be omniscient.

One caller, a well-dressed lady, who one evening drove up in a carriage, created quite a sensation by asking for 'Don Quixote, by Charles Dickens.'

'I beg your pardon, madam,' said the bookseller cautiously, 'did you say "Dombey and Son?"'

'Oh no! Don Quixote!' she emphatically replied.

'I have a beautiful copy of a work of that name by Cervantes,' he said, showing her the volume.

After turning over its pages awhile in doubt, she murmured: 'I'm afraid this will not do for me. I want the one by Charles Dickens to complete a set!'

A curious example of generous obstinacy was a stout countryman who inquired for a nice book to read—'one with a story in.' On several being placed before him, he examined them attentively, and picked out the middle volume of a 'three-decker' with the remark, 'This 'ere's my sort. What's the price?'

'Oh,' was the reply, 'this is only the second volume; the story goes through three—the set is half-a-crown.'

'Hauve-a-crown! Well; I'll gie ye that for that one book. It's a pretty un enough.'

'But won't you have the other two as well? You'd better!'

'Naw! I don't like th' beginnin' of a story; I can't get forrard wi' it. An' I don't like th' endin'; I don't know as 'ow it's comed about. But in th' middle un I'm into t' thick of it right off. No; I'll only tak' th' middle un; it'll set me up for a month.' And cramming the book into his pocket, he put down his half-crown and disappeared with a 'Good-night!' before the other volumes could be given to him.

Another was a tatterdemalion strongly reminiscent of Quilp. He was not quite so hideous; but what he lacked in that was counterbalanced by rags, dirt, and odour. He arrived in a flat donkey-cart, and, sneaking into the shop with a big empty sack in his hand, he inquired in a nasal treble: 'Anythin' in my line to-day, Mister? I can do with a sackful.'

'No,' answered that gentleman sternly, without looking up from his cataloguing; 'I never have anything in your line, and never shall. You haven't paid me for that last lot of books.'

'Aven't paid ye!' he squeaked in simulated astonishment. 'S'elp me! 'Ave ye 'ad yer letter-box broke open lately? 'Cos that's why yer never got that there cheque as I sent ye!'

'Cheque!' exclaimed the bookseller, still writing. 'You haven't any money in your pocket: never mind the bank.'

'No money in my pocket, eh? 'Aven't I, though, eh? Jus' you wait! Oh, no!—no money!' With these exclamations, he dropped his sack, and diving here and there into his rags—it was a wonder he found the way to a pocket among so many holes—he fished up a dirty, bulky cash-bag, which jingled very suggestively while he was nntying the string. The bookseller looked up in astonishment, then he burst into a roar of laughter as the contents of the bag were turned out on a sheet of music: rusty keys, penknife blades, divorced scissors, clock-wheels, nails, screws, and tacks—among which Quilp Secundus fumbled till he found something which he put into his mouth to clean, and then triumphantly slapped on the palm of his left hand. 'No money, eh? Look there!' The purchase-money for a sackful of books was a threepenny piece!

No trade was done; and Quilp muttered as he went out: 'When man can't trust his brother-man, commerce is a-goin' to the dogs.'

An entirely different character was a worn, elderly-looking man, who, one Tuesday night, came into a bookshop asking for help. The bookseller, who seemed to know him, offered him, out of a stock of three hundred or so, a dozen shilling pamphlets—speeches of John Bright, marked for sale in the window at three-pence each—to sell in the street at any price he liked, provided that when he had sold the dozen he was to buy any more he wanted at a reduced rate. In five minutes he was back to pay his halfpence, and take away two dozen. A longer interval elapsed before he returned to invest his earnings in more. So he went on for the rest of the evening and throughout the week, till on Friday, looking much younger—the effect of better living—he bought the remaining stock; and on Saturday he presented himself to the bookseller to say that he had saved three pounds, and was going to set up an apple-cart on Monday. This he did; and when we saw him last, judging by the sound of his voice, and the patronage of the office boys whose pennies will buy them more dessert than dinner, he seemed to be doing a roaring business.

Booksellers' catalogues are perennial springs of pleasure to the book-lover, who often is unable to part with a single one, but hoards them up like a miser. He goes most carefully through each one as it comes in, marking off all the books that he would like, without regarding their heavy prices or the lightness of his purse; and when he has added up the total amount and found how little of it he can afford, he sighs, and consoles himself with the reflection that most of them he can live without. The sole consolation of one such bibliophile was to become the possessor of the books he had ticked off. He had, however, money to spend, and was uneasy till he had spent it. When the books arrived, he occupied hours in skimming their contents and placing them on his shelves. Some of these he gradually discovered were not literature; and being proud of his library as a collection of works of high literary and artistic merit, he—more cautious than Gilead P. Beck, who made a bonfire of his Browning—as gradually weeded them out, and placed them side by side with other books of like calibre in a special corner

in his attic. This became a penance chamber; for, when, as occasionally happened, he was in a pessimistic mood, he invariably visited it, sat down in the midst of these 'books that were not books,' and, considering them as the causes of wasted time and pence, solemnly objugated them.

Catalogues, too, are happy hunting-grounds for unintentional humour, which arises sometimes from the printer's errors, sometimes from incongruities of arrangement and expression. A sample of a combination of both occurs in the titles, 'The Art of Dying; back gone;' and 'Eastlake's Lady, old and ragged.' The printer alone seems to be responsible for such as 'A Theory of Immortality;' and 'Drew's Essay on Soles' is more suggestive of ichthyology than theology. The substitution of a small *i* for a capital humorously suggests the obtrusion of a celebrated Norwegian novelist, 'Bjornson in God's Way;' whilst by the insertion of a comma in the wrong place, 'Jernsalem, delivered in prose,' we might imagine that the Crusades were wars of words not weapons.

The habit frequently adopted by booksellers of using the possessive case of a writer's name followed by the title of his work leads sometimes to curious effects. For instance, 'Berkley's Wealth and Welfare;' 'Lalor's Money and Morals;' 'Turner's Wish and Will;' 'Ellis's Temper and Temperament;' and 'Wynter's Subtle Brains and Lissom Fingers,' suggestive of the Artful Dodger's profession. Occasionally, the bookseller himself deviates into humour, as in the two following instances: 'King's Interest Tables, a rather poor copy, and very poor price;' 'Poems by James Gay, with a portrait of the Great Man, who modestly calls hims lf Poet Laureate of Canada and Master of ali Poets. Notwithstanding these high claims I sell his poems for 4d.'

One gratifying effect of free lectures for the poor is the greater frequency of the demand among them, both at the free libraries and shops, for books which they hear mentioned or quoted, and feel desirous of reading. There is something pathetic and hopeful in the accidental humour of the book titles they jot down as aids to memory; the humour of inadequate knowledge brought to the assistance of the erewhile unknown. From such lists we cull these examples: 'The Works of Mac Sadler' (Max Adeler); 'The Quinsey's Opium-eater;' 'Jane Hair;' 'The Middle Ages of Alum' (Hallam); 'Story of Andrew Mackay' (Andromache); 'Maud Arthur' (Morte d'Arthur); 'Shoppinghour' (Schopenhauer); 'Lamb's Asses of Elias;' 'Carlyle's French Revelation;' 'Dictionary of Verbal Words;' 'The Decline of Gibbon.' In view of demands for books like these, one naturally thinks of two anomalies that are not, unfortunately, happy enough for amenities: Ruskin's endeavour to educate the labourers and workmen of Great Britain, and the unreason of the reasoner Schopenhauer. It is a satire on Ruskin's theory that those very labourers, for the volumes of letters addressed specially to them, must pay the prohibitive price of four pounds, while they can purchase a handsome Shakespeare for three shillings, and become the possessor of a classic like Carlyle's 'French Revolution' for half that

amount. As for Schopenhauer, he declaimed against reading, but waxed irritable when the public, taking him at his word, did not buy his books.

A BOAT-SERVICE ADVENTURE.

RATHER more than three years ago I was serving as sub-lieutenant on board H.M.S. —, at that time engaged, with the rest of the British and German men-of-war in those waters, in the blockade of the East Coast of Africa. This blockade was the result of a sort of compromise. The British wished—as they have always wished—to put down the slave-trade, and the Germans to prevent the sale of arms to the native inhabitants of their new colonies. So the two admirals arranged to join forces, and declared a joint blockade of all vessels trading in arms or slaves. Of course, there were other niceties in the agreement; but that was the gist of it.

To carry out the blockade effectually, each ship was allotted a station, for which she became responsible. H.M.S. — was ordered to take charge of the island of Pemba, which, although not, properly speaking, a part of the coast, or even fringing it—there being a channel of half a day's run between them—had nevertheless been included in the blockade. Pemba is the first or northernmost of the three Arab islands, Pemba, Zanzibar, and Mafia, and was then under the rule of the Sultan of Zanzibar; but this rule was far more nominal than real; practically, it was parcelled out among rich Arab families, the heads of which were almost independent chiefs, or perhaps it would be more correct to say, independent merchant-princes, for, taking into consideration that Pemba has so far had no European capital or European enterprise to help it, its commerce is very creditable, and is all in the hands of these feudal Arabs, who own not only plantations—cloves, sugar, &c.—but mercantile fleets to transport their produce. And—and it is here that there is a certain 'coolness' between these gentry and the British naval authorities—these ships are apt to return from their trading voyages laden with slaves for their owners' plantations.

The most remarkable feature in the geography of Pemba is its deeply indented coast-line, which is simply studded with natural harbours, with here and there an arm of the sea stretching so far inland as almost to divide the whole island—something like the Scottish firths, only more irregular. Add to this that it is fringed with reefs and sandbanks, sometimes extending many miles out to sea, and you will understand that H.M.S. — had plenty of work to do, and that most of it had to be done in boats.

I was given command of the steam-cutter, and ordered to hold myself responsible for a large bight rejoicing in the jaw-breaking appellation of Kegomacha Bay. Here I was left with my crew of six and an interpreter, making with myself eight all told. We left the ship with provisions and coal for five days; but as it was quite out of the question to keep all that coal in the boat, we made a *cache* of most of it, and hoped that it might remain unstolen; if not, well, we must cut wood.

My next care was to have things put square

and shipshape in the boat; spirit-breaker and ammunition boxes aft, other large stores under the thwarts, and small articles in the lockers. Then, having had a regular clear up, we made tea, after which I inspected the arms and served out ammunition. By this time it was nearly five o'clock; so, as I wished to get well into the oiling by nightfall, I ordered the anchor to be weighed, and stood out to sea.

My reason for doing this was as follows: The Arabs are very good navigators; but even the best navigators, when making a reef-bound and unlighted shore, like to verify their position by getting a good look at the landmarks during daylight. When a vessel is liable to be chased, this is all the more necessary, as she cannot afford to go pottering about among shoals, trying her nose first at one point and then at another, but must dash right through the darkness to her own particular little harbour, and to dash with any confidence, requires an exact knowledge of one's whereabouts and of the bearing of the point to be dashed at. It has thus become customary for the captain of a slave dhow so to regulate his voyage as to be just in sight of land at sunset; the nearer he can manage this the better for him: to be too soon, means showing himself longer than he cares about in what he probably calls 'the dangerous-in-daylight zone;' to be too late means that he does not get a clear view of the land. Relying on this, I argued that a small boat like mine, with no sail hoisted, and steaming easy so as to avoid making smoke, by arranging on her part to be at about the same distance from the shore at the same time, or perhaps a few minutes later, might, with the binoculars, have a very good chance of sighting one of these gentlemen just as he was bearing up for harbour. This was my plan; and you may be sure that I searched the horizon very carefully as the sun went down, and the short twilight of ten minutes or so that there is in those parts gradually merged itself into the dark.

At last I was rewarded; looming up on our starboard bow was something large and black; soon it began to assume definite shape, that of a triangle: it was a dhow's lateen-sail. Unfortunately, just at that moment the stoker, who ought to have known better, opened the furnace door, letting the glare light up both himself and the bowman: almost simultaneously, the dhow put her helm down and headed away for the eastern extremity of the bay.

'Full speed!' I shouted, at the same time catching up a rifle and sending a bullet through her sail as a summons to heave to. Strictly speaking, I ought to have first tried her by firing a blank cartridge; but, under the circumstances, I dispensed with that formality. Of our summons she vouchsafed, as I had expected, not the smallest notice; so we settled down to the chase. Some ten minutes had elapsed, when the cockswain remarked to me that the water seemed to be growing very shallow. A sounding, taken with the boat-hook staff, showed him to be right: there was barely a foot of water under our keel. Now, I knew that somewhere hereabouts there was a large sandbank, with occasional patches of very shallow water indeed on it; and it occurred to me that the dhow must have altered course as she did with the object of bringing us across

one of these. Lest it be thought singular that a native Arab dhow should have better hydrographic information than a boat belonging to one of Her Majesty's ships, I may say at once that not only is all this part very roughly charted, but that even the best chart could hardly be expected to give all the little boat-channels that criss-cross a large reef or sandbank; whereas a dhow belonging to the neighbourhood would have her own private marks for every rock and every pool. Had it been a dhow from any other part of the island, she would have known a great deal less than we did; but it being our first day, we had not had time to make our own observations, and this particular dhow had the advantage of us.

However, to have done anything but keep straight on now would have been to make certain of losing her. While I was reflecting on these things, and wondering whether so small a boat as we were might not escape grounding, I got a most unmistakable answer; namely, a prolonged scraping noise under the keel. For fifty yards, perhaps, we struggled on, churning up the sand with our screw, then came to a full stop.

On this I gave the order, 'Stop the engines; all hands overboard,' setting the example myself. Relieved of our weight, the little cutter floated again, and, four a side, we walked her along by the gunwale until once more she brought up with a bump.

'I see what's the matter, sir,' said the cockswain, who was stooping down at the bows; 'there's a boulder right under her forefoot: launch her back a fathom.' This we did, and then, altering the direction of her head, got her forward again through a distance of perhaps twice her own length. Here luck was once more against us: the water shoaled to about two feet. I suppose that the chase must have heard our not too mild expressions of disgust at this new check, for out of the night came various guttural sounds, the English equivalents of which would probably have been something like: 'Hope you're comfortable; sure you don't want a tow?' and so on. This was too much. We shoved, and we pushed, and scraped the sand away from the bows, and finally I told the leading stoker to lean over and set the engines going. Then at last she began to move. The word 'Stop!' was just on my lips, when, before we knew where we were, the boat gave a sort of slither forward, and—souse! we were all under water. She had been on the edge of a steep bank, and had slid off.

In a few seconds we were all up again, spluttering and laughing, and fortunately untouched by the screw; but where was the cutter? Here was something that Mark Tapley himself would have found it hard to laugh at. Being under steam, she had gone on by herself. In fact, I fancied that I could just discern her outline away out to seaward.

Our position was most serious. Our foothold, such as it was, would be lost when the tide came up, and there being a strong northerly current, we should infallibly be swept out to sea. Even supposing that one or two of the strongest of us managed to reach the shore by swimming, what sort of a fate would be theirs at the hand of people who, only a few months before, had mur-

dered a whole boat's crew, and were now smarting from the indemnity that they had been forced to pay for their crime? And this supposition made no account of sharks, which, although not so bad as in some parts, were yet quite sufficiently numerous to constitute a danger.

Every minute that passed, the boat was steaming away; yet what was to be done? In this dilemma I called the two petty officers, the cockswain and the leading stoker, to a council of war. Imprimis, we were all agreed that to swim *after* her and try to catch her that way would be mere foolishness, and wasting our strength to no purpose. Now there came to my mind a certain conversation that I had once had with a very scientific officer anent what are called 'turning circles.' A ship's handiness is said to be measured by the diameter—that is, the smallness of the diameter—of her 'turning circle' with different degrees of helm. This is fairly clear. It does not want an expert to understand that a vessel under steam with her rudder kept over at the same angle will, if there be no tide or current, ultimately come back by a circular course to the point at which she started. What, however, is not so well known is that a screw steamer even without any helm at all will do this. But she will take a very long time about it. The reason is that a screw steamer left to herself never goes quite straight ahead; to make her go straight ahead requires a little helm. Hence, leaving her entirely alone comes to the same thing as giving a little helm to a paddle steamer. The officer in question had been making experiments in a piece of ornamental water with model screw steamers, and had been trying to see what kind of screw caused least deviation from a straight course; and he said that he was surprised to find how exactly all his models came back to the very spot where they had started from. 'In fact, my dear fellow,' he had said, 'a screw steamer is nothing more nor less than a very cumbrous sort of boomerang.'

But, oh dear, what poor encouragement were those ornamental-water experiments to us, standing on a little knoll of sand, miles from the shore, with blackness all round us, a rising tide, and eddies and currents swirling this way and that, sufficiently to render nice mathematical certainties very uncertain indeed. No; we must have something more to go on than the action of the screw as a turning agent, to hope that our little boat was coming back to us. Strangely—and fortunately—there *was* something else. The cockswain was in favour of swimming after the boat, not thinking that we could catch her at once, but that, after ten minutes or so, she might begin to slow down of herself. I knew better than that, and so of course did the leading stoker; besides, I pointed out to him, she was out of sight, and it was very unlikely that we should be able to make a correct guess at her course. Finding himself outvoted, he urged that, after all, she was half crippled by the bowman's tarpaulin hanging over the port side.

'The bowman's tarpaulin hanging over the port side!' I repeated, with hope beginning to dawn. 'Are you certain?'

'Quite, sir. I made a grab at it to save myself going under water, and the whole thing came overboard.'

'But it's fast to the boat?'

'Oh yes, sir; it's made fast right enough; but it's dragging through the water, and that's enough to stop a little boat like'—

'Stop her, with that head of steam on!—not a bit of it,' I replied. 'But it'll do better—it'll turn her.'

I don't think that the men were very sanguine; but that I could not help. If there was a heavy tarpaulin hanging over one side of the boat, she was bound to keep turning towards that side. The only other thing that could influence her course was the current, and this, in the main—for it would be hopeless to attempt to go into the various eddies—set towards the north. Therefore, the boat would come round to a point due north of us. How far north, and how long before she got there, depended upon how much tarpaulin was hanging over the side, and of course could only be guessed at. At any rate there was no time to be lost.

I called for four hauls to strip, and did the same myself. While we were stripping, I made the men take their knife lanyards and knot them all together. To these I added some twice-laid rope, of which the cockswain carried a coil in his monkey-jacket pocket; my own *kammarband*, which, for the information of those readers who have not been in India or the East, I may describe as a kind of long sash; also the interpreter's: altogether this gave a pretty long rope. What I intended doing with it, you will see later.

When every one was ready, I gave the men their orders. First of all, I made them observe the constellation of the Southern Cross. This, I explained to them, they were to keep straight behind them, so that they could be certain that they were swimming due north—that is, straight out to sea. We would all start together. After fifty strokes, one man would stop and tread water; after another twenty-five strokes, another man; and so on until we were all posted at intervals of twenty-five strokes, the inmost man being fifty strokes from the knoll, and myself being the farthest out. You see, I reckoned on the tide having set her out something between fifty and a hundred and fifty strokes—rough reckoning, but the best I could do. Finally, I cautioned the men to try and scramble on board by the tarpaulin, as by so doing they would avoid the risk of being wounded by the propeller. The rope I kept myself.

I don't think that there is much fear of my ever forgetting that swim out into the waste of black sea. There was nothing really dangerous about it bar the sharks, and the sharks would have been almost as dangerous on our little sand-knoll, where the danger would have come, had we been unsuccessful, after we got back to the others and found the tide begin to rise. Yet the sense of loneliness, increasing as one by one the men came to their allotted stations and were left behind treading water, was something terrible.

At last I had come to my post. How I wished there was a moon! Until then, I don't think that I had ever realised how terribly contracted is the horizon of a man whose eyes are only a few inches above the sea: he can hardly see any distance. At the end of three minutes

or so I seemed to hear something; what it was I could not say; nevertheless, I instinctively swam a few strokes in the direction from which the sound seemed to come. Then I listened again. Yes, it was there, and plainer. Whether it were the cutter or not, it was something; and should it turn out to be two pieces of driftwood knocking against one another, placed as we were they would be almost salvation to us. So I continued to swim in the same direction. But it was not driftwood, and it was the cutter—the cutter heading about north-west, and coming up—thank goodness—from a little behind me. The question now was: could I cut her off? Reader, have you ever witnessed a boat-race?—so have I; have you ever bet on a boat-race?—I am afraid that I must plead guilty to having done the same. But in future I shall never take the same interest in the sport; believe me that, beside a boat-hunt, a boat-race is tameness itself.

Well, I swam my best, and found—that I should miss her by ten yards! Now for my last card. Waiting until I was as near to her as I ever should be—that is, barring the chance that my card should turn up trumps, I raised myself in the water, and flung my rope, in a big loose coil, straight at her stern, then settled down to swimming again. A few strokes, and I was sure that I was gaining on her—my rope had done its work, that is to say, it had fouled the screw. Had I tried holding one end of it, it would most likely have slipped off; but being quite loose, it had wound itself so effectually round the blades and boss, that later, when we tried to get it off, the only way in which we could do so was by cutting it off in little bits. By the time I reached her, she was almost motionless.

You may be sure that I did not lose much time in firing a rifle to let the crew know that they had once more a boat to go to. In ten minutes or so all hands were on board; and very glad we were to dry our clothes, make some cocoa, and smoke our pipes.

As for the dhow, she got away, but was caught next voyage.

LUX IN TENEBRIS.

THE castle window on the height
Burns crimson through the leafless trees :
But lo ! the sun in frosty seas
Goes down, and all the world is night.

Not all. For there, amid the gloom,
The darkened window glows again
With softer light : the ruddy pane
Gives token to the night of home :

And leaping with the leaping flame,
Soft shadows on the ceiling move—
A lover reading to his love
Of Camelot and Arthur's fame.

Oh heavy heart, from sorrow win
A guerdon countervailing doubt :
God sometimes drowns the light within,
Lest thou forget the light within.

OTTERBURN.

THE battle of Otterburn was one of the most famous contests recorded in the annals of chivalry. It was not a national contest in the sense in which Bannockburn is, although it occurred in the course of an invasion of England by the Scots. The fate of nations did not hang upon the issue. It was in reality a personal fight, in which the rivalries of two powerful Border chiefs were put to the arbitrament of the sword. Each of these chieftains was a sort of king in his own country—the Percy in Northumberland, the Douglas in Teviotdale; and the fight that ensued was perhaps all the more bitter and bloody for this element of personal rivalry and clan hatred that entered into it.

It is not, however, to the strict records of the historian that the name of Otterburn owes its popularity. This has been the work of the old ballad-writers—the nameless bards and musicians of a far past who ‘sung other names, but left their own unsung.’ The older and the later ballads of ‘Chevy Chase,’ as well as the English and the Scottish ballads on ‘The Battle of Otterbourne,’ point evidently to the same contest. The outstanding feature in all these is, that a Percy and a Douglas had a great fight, the inevitable horrors of which were tempered by the fine spirit of chivalry that animated both the principals in the fight and their followers, and the result of which battle was that the Douglas lost his life and the Percy was ‘led captive away.’ The older ballad of ‘Chevy Chase,’ which probably belongs to the fifteenth century, was perhaps that of which Sir Philip Sydney was thinking when he said: ‘I never heard the old song of Percy and Douglas, that I found not my heart moved more than with a trumpet.’ Even the learned Ben Jonson declared that he had rather have been the author of ‘Chevy Chase’ than of all his own works. So true is it that song is more powerful than science; that that which touches the heart and stirs the imagination, even though it be but a simple lilt of verse, is more enduring than the

ponderous tomes that speak only to the intellect.

Yet this popular appreciation of the ballads in which the prowess of the Douglas and Percy is embalmed has not been without its drawbacks, for it has led to a great misunderstanding of the leading events of which the battle formed but an episode—though indeed the chief episode. If you were to question people on the subject of the battle and its origin, probably nine persons out of ten would answer that the fight was the result of an attempt on the part of the one chieftain to hunt upon the lands of the other—a kind of poaching raid on a great scale checked by an opposing army of game preservers. All the ballads, whether they are written from the Scottish or the English point of view, agree in this. The older ballad of ‘Chevy Chase’ has it:

The Percy out of Northumberland,
And a vow to God made he,
That he would hunt in the mountains
Of Cheviot within days three,
In the mangle of doughty Douglas,
And all that ever with him be.

The later version, also, in relating the ‘woeful hunting’ that once did ‘in Chevy Chase befall,’ says:

To drive the deer with hound and horn
Earl Percy took his way.

Both the English and the Scottish versions of ‘The Ballad of Otterbourne,’ while agreeing that it was a hunting expedition, differ, however, from the ‘Chevy Chase’ ballads in so far as they represent Douglas and not Percy to have been the intruder.

It fell about the Lammas tide,
When the muir-men win their hay,
The doughty Douglas boun’d him to ride
Into England, to drive a prey.

All these ballads so agreeing as to the conflict having arisen out of a hunting raid, not anything that may be written by the historian to an opposite effect will ever succeed in eradicating the popular mistake.

The scene of the battle itself is not, we should think, a frequent place of pilgrimage, as it is not conveniently accessible. It lies far away among the high and solitary moors of Northumberland, where they stretch, brown and naked, southwards from the crest of the Cheviots. Bellingham Station, on the North Tyne Railway, is perhaps the best starting-point for the pedestrian, and he has a walk northward of from eight to ten miles, over a weary tract of moorland, before he reaches the little village that bears the famous name of Otterburn. All this district of Northumberland lies at a high level above the sea, and as the soil is wet and sour no trees grow upon it; hence the landscape has a dreary and uninviting aspect, especially to one who has just quitted the beautifully wooded vale of North Tyne, with its rich green slopes and its crystal winding river.

The little village of Otterburn lies in Redesdale, and receives its name from the brook that here comes down from the hills, and falls into the Rede Water. Near to it is the ancient Roman road known as Watling Street, which runs up Redesdale for some miles, then crosses the Cheviots, and descends into Scotland, being traceable still for most of the way until near Melrose. The fact of the vicinity of the field of Otterburn to this old Roman Road accounts no doubt for this being the scene of the battle, as this road afforded the Scots an excellent means of returning—as we shall find they were returning—into Scotland.

The battle was brought about in this way. During the reign of Edward III. and that of his successor Richard II., Scotland had been grievously harassed by the English. Time and again had the Southron forces marched across the Borders, burning and slaying and laying waste wherever they went. The Scots, so harassed, were fain to make friends with France, which country was also much pressed by the English. In 1385, the king of France sent one of his generals to Scotland with a thousand men-at-arms, knights, and esquires, to assist the Scots against England; but with them also he sent what was still more acceptable to the Scots, poor as they had been now rendered by the constant harryings of the English—namely, the sum of fifty thousand livres, and no fewer than twelve hundred stands of complete mail. No doubt at the battle of Otterburn many a French helm and hauberk had its metal tested under English lance and axe. But the French men-at-arms themselves proved rather a trouble to the Scots, and nothing was effected by their help against England.

But in 1388, the year in which Otterburn was fought, the Scots roused themselves for a war of reprisal against their Southron enemies. The English government under Richard II. was weak and divided, even the noblemen on the English Border being at enmity among themselves. This, in the opinion of the Scottish barons, afforded a favourable opportunity to strike their long-meditated blow. All the arrangements for the invasion were made with as much privacy as possible, so that the English might be taken unawares; and on St Oswald's day, 5th August, the Scottish forces met near Jedburgh to the number of forty thousand men. But secret as their proceedings had been, the rumour of

them had reached the Earl of Northumberland. Hence, when the Scots met in council of war in the church of Southdean, at the foot of the Cheviots, an English squire, in the dress and arms of a Scotsman, entered among them, as if he had been in the retinue of one of the Scottish nobles, and so listened to all their deliberations. But when he retired from the church, he found that his horse, which he had fastened up with the others, had been stolen. Not wishing to attract attention to himself, he proceeded to walk quietly away. But two sharp-eyed Scottish knights saw him thus walking off, booted and spurred.

'I have witnessed many wonderful things,' said one to the other, 'but what I now see is equal to any. That man yonder has, I believe, lost his horse, and yet he makes no inquiry about it. On my troth, I doubt much if he belongs to us; let us go after him and ascertain.'

When they came up to and questioned him, he prevaricated and contradicted himself; upon which they seized and carried him before the council. There, under threats of immediate execution, he confessed his espionage, and revealed the English plans. These were, to wait until it was seen whether the Scots should enter England on the eastern or the western frontier; and when the event had decided which, the English were to advance into Scotland on the opposite side, and so harry the country in their absence. In consequence of this information, the Scots leaders resolved to divide their army into two divisions, sending the main body into England by Carlisle, and the second by way of Northumberland. The latter division consisted of about four hundred mounted men-at-arms, with two thousand infantry, and was placed under the command of James Earl of Douglas. Southdean was but a few miles from the head of Rede Water, over the Cheviots; and down this valley the Douglas soon led his men into the heart of Northumberland.

The English spy having been sent a prisoner to Berwick, the first news the Northumbrians had of the Scotch invasion was in the clouds of smoke which ascended wherever they passed. The Scots spoiled and burned as they went along. And so rapid was their march, that they had entered the rich county of Durham, penetrated to the gates of Durham itself, burning and killing and gathering booty everywhere, had returned and recrossed the Tyne, and were before the walls of Newcastle by Friday the 14th of August, within eight days from the time they started. To account for the rapidity of these movements, it must be borne in mind, that although only the men-at-arms fought on horseback, the infantry when on the march were also on horseback. They rode on small horses, and could act on occasion as light cavalry; but on the eve of a battle, their horses or ponies were dismissed in the charge of attendants, and their riders fought on foot. And Froissart tells us that on this occasion the two thousand infantry were, on the march, all mounted.

It was here, then, before the gates of Newcastle, that the series of chivalrous exploits began which ended in the fierce conflict of Otterburn. The Earl of Northumberland had himself remained at his castle of Alnwick, but sent his two sons, Sir Henry Percy ('Hotspur') and Sir Ralph to defend Newcastle. Here between the

Friday and the following Monday, the Scots had made various attempts upon the town, and, as was the habit of the times, many a fight took place before the barriers. But it was on Monday, the 17th, the great event happened; for on that day the Douglas and the Percy met in personal conflict, when the latter was unhorsed, and his lance, with the pennon thereto attached, taken by Douglas. Hotspur was only twenty-three years of age, while Douglas was about thirty-eight; both experience and strength may therefore be said to have been on the side of the Douglas. Nevertheless, the loss of his pennon was a gallant affront to Percy and the English, while its capture was none the less a matter of rejoicing to Earl Douglas and the Scots.

The Earl, as he bore away his prize, exclaimed: 'I will carry this token of your prowess with me to Scotland, and plant it on the tower of my castle at Dalkeith, that it may be seen from afar.'

'By God,' replied Hotspur, 'you shall not even bear it out of Northumberland. Be assured you shall never have that pennon to brag of.'

Douglas answered: 'You must come this night and seek it, then. I will fix your pennon before my tent, and shall see if you will venture to take it away.'

Accordingly, Douglas planted the spear with the pennon at the door of his pavilion, and appointed a strong guard, as he fully expected a night attack. And so there would have been had the heady Hotspur had his own way. But the English leaders dissuaded him. They did not know where the rest of the Scottish army was, and might be led into an ambush.

The night having thus passed without battle, Douglas began his return into Scotland. He had a rich booty with him, and every hour's delay would strengthen the enemy, who were gathering assistance from every quarter. By four o'clock on the morning of the 18th, he was at Ponteland, eight miles from Newcastle, and there he tarried for a few hours till the town was taken and its owner made prisoner. Then the Scots once more began their march towards the Cheviots, and in the afternoon were before the tower of Otterburn, fully thirty miles from Newcastle. They attacked this tower also, but did not succeed in taking it; and when evening approached the Scots took measures to intrench themselves for the night. With this view Douglas selected a strong situation on a spur of hill about a mile in advance.

They lighted high on Otterbourne,
Among the bent sac brown.

Here he probably found the remains of a round hill-fort, and within this he made all secure for the night. The ground in front of him, and which formed the site of the battle, was an easy slope descending towards Otterburn and the Rede Water, with marshy land on both sides; and, though the slope is now bare and treeless, it was then protected in many parts by trees and brush-wood. As Percy describes it in the ballad:

The roe full reckless there she rins,
To make the game and glee;
The falcon and the pheasant both,
Among the holts on hie.

This action of Douglas, of intrenching himself above Otterburn, was against the better judgment of the barons and knights in his train. They would have preferred to make good their return into Scotland, of which they were within a few hours' march. But Douglas's chivalrous instincts as a knight were, like those of James the Fourth, too strong for his prudence as a leader. He had promised to give the Percy an opportunity of winning back his pennon, and here at Otterburn should he wait for him.

'Thither will I come,' proud Percy said,
'By the might of Our Ladye!'—
'There will I bide thee,' said the Douglas,
'My troth I plight to thee.'

Next morning, a portion of the Scottish army renewed their attack on Otterburn tower, but the place was strong and well defended, and withstood the assault successfully. At night, once more, the Scots withdrew to the shelter of their camp. It was the evening of Wednesday the 19th of August. The sun had not yet sunk in the western sky, when low down on the eastern horizon rose the red moon, now at the full, all night long to shed its dim rays upon as stern and deadly a conflict as ever broke the stillness of night. The chiefs, wearied with the day's fruitless assault, had relieved themselves of their heavy armour, and were sitting at supper in their 'side gowns,' when the cry broke that the Percy was upon them. And so it was. Had the English attack been directed against the pavilions where the knights were, the discomfiture of the Scots had been inevitable; but it so happened that the portion of the camp which they surprised on the east side was that occupied by the sutlers and camp-followers. Bands of infantry were at once despatched to maintain the fight until the knights and men-at-arms had time to don their armour; and so hastily and imperfectly was this done, that Douglas went forth to the battle without his helmet, and many other lords and knights were equally unprepared.

The English, like the Scots, fought this battle on foot. The dim light and the nature of the ground did not admit of the movements of cavalry. Percy was at the head of eight or nine thousand men, thus greatly outnumbering the Scots; but Douglas, when he issued from his tent, led his knights round the back of the camp, and assailed the English in flank. The fight was long and stubborn, and at first the English were like to have the victory. But about midnight, heavy clouds began to roll across the sky, shutting out the light of the moon; and the wearied combatants withdrew their forces for a time, glad, no doubt, of a brief breathing-space. When once more moonlight was shed upon the scene, the fight was resumed. Seeing the English massed strongly at one point, and anxious to recover the spirits of his men, Douglas seized a huge battle-axe, which few but he could wield, and followed only by his armed chaplain and his son bearing his banner, he rushed into the midst of the enemy, shouting his war-cry of 'A Douglas! a Douglas!' The English ranks opened before his terrific onslaught, his hand dealing death wherever it fell; but he went too far, and was hopelessly involved in the press, and could not return. Borne down by spears on every side, at last he

fell mortally wounded, while his chaplain stood over him to protect his body. The Scottish knights rushed in to his assistance, and the English were driven back. The Douglas prayed his companions to hide his fall from his followers, and to raise his standard once more as if he were at their head. This was done; and the Scots, shouting his war-cry, made so terrible an assault upon the English, that the latter were broken up and began to quit the field. In the press, both the Percy and his brother were surrounded and taken prisoners, while the Scots chased the English with great slaughter long five miles from the field.

The Scottish ballad gives a touching picture of the dying Douglas. Addressing his nephew, he says:

'My wound is deep; I fain would sleep;
Take thou the vanguard of the three;
And bury me by the bracken bush
That grows on yonder lily lee.'

They buried him not there, however; but bore his remains home with them to the Abbey Church of Melrose.

And there the dying lamps did burn,
Before thy low and lonely urn,
O gallant chief of Otterbourne!

His son, Archibald Douglas of Cavers, who bore his standard, carried it home with him, where in Cavers house it is still preserved, along with two ladies' gauntlets, beautifully embroidered with pearls, known as 'The Percy Relics.' These latter were probably attached to the spear which the Douglas took from Percy under the walls of Newcastle.

J. R.

THE BURDEN OF ISABEL.*

CHAPTER XXXII.—'LOVE THE GIFT IS LOVE THE DEBT.'

WHEN she and her luggage were safely bestowed in the dogcart, when she had been well wrapped in rugs, and when they had dashed out of the station into the raw darkness, then Isabel thanked George for coming for her.

'Nobody knows I've come,' said George. 'We waited all day yesterday for you, and were just beginning to think you were not coming at all, when in came your telegram.'

'But that made it all right—did it not?' said she.

'Well,' said George, with a joyous laugh, 'nearly right. But you didn't set down what line you were coming by: there are three lines, and each has a night-train.'

'How foolish of me!' she exclaimed. 'And you have been waiting about for three trains!' She considered him a moment, as if she found him a more eager lover than she had bargained for. 'I found,' said she, by way of apology, 'that I had a good many things to do yesterday, and I thought I would take the night-train for the sake of having a new experience.'

'So like you, Bell,' laughed George, 'to want a new experience!'

'Is it?' said she simply. 'I suppose it is.'

When they were well out on the clear high-

way, and one hand was enough to hold the reins, he put down his other hand to seek hers; but she affected not to understand his purpose, and let her hands remain hid. The mare knew that she was going home to a bran-mash, and she spanked along at such a rate that speech was impracticable; so the two sat silent, and wrapped against the cold air; and mound and tree, cottage and bush, fled fast away from them, looking merely like blacker features and articulations of the general darkness.

None of the household—save a groom to take charge of the mare—was astir when they arrived. Isabel retired at once to freshen herself with a bath and to change her dress. She did not come down till the breakfast bell rang; and then, when she had made her apologies and explanations, there were presented to her a great surprise and determining shock.

They sat at breakfast, when Mr Suffield, who had been running his eye up and down the columns of *The Lancashire Gazette*, murmuring the while 'H'm! Ha!' suddenly exclaimed to the table in general: 'Bless my soul! Now, what do you think of this?' And then immediately to Isabel in particular: 'What do you think of this, Bell?'

'Well, what is it?' cried all.

'It's in "Our London Correspondence,"' said Suffield. 'Listen: "The unequivocal and brilliant success of "The Backbiter" at the afternoon performance yesterday at the Variety Theatre has compelled the management to disclose the name of the author. The audience insisted with stamping of feet and reiterated cries of "Author! Name! Name! Author!" and the manager stepped before the curtain, and said that the author was not in the house, but he would give his name—Alan Ainsworth."—There!' said Suffield. 'What do you think of that?—Did you know his play was going to be produced yesterday, Bell?'

'No,' she answered; 'I did not. I did not even know it was finished.' She had an overwhelming sense of pain and desolation, as if this were the final cut that severed all connection betwixt herself and Ainsworth: he had not thought it worth his while to give her his confidence, even in this small matter. She had come down extremely doubtful what answer she should give to George: now she had no doubt whatever.

"The play," Suffield resumed, "will be placed at once in the evening bill of the theatre; and while the enterprising manager may be congratulated on having secured a piece that is certain to run for many days and to take a place in the repertory of the theatre, Mr Ainsworth is no less to be felicitated on having in all human probability won fortune as well as fame. Mr Ainsworth was known, though it may be but anonymously, as a brilliant member of the staff of this journal until less than a year ago, when he was invited to assume a responsible position on the metropolitan press. Mr Ainsworth has shown he can do admirable work; and his friends, of whom the present writer has the privilege of counting himself one, are confident he will go far."—There!' cried Suffield, slapping the paper on the table. 'What do you think of that?'

* Copyright reserved in the United States of America.

'The hand is the hand of the London Correspondent,' thought Isabel vaguely to herself; 'but the voice is the voice of Alexander.—He deserves his success,' said she aloud: 'he has worked hard for it.' She spoke quietly but frankly, and no one guessed there was the pain of separation at her heart.

'I always said,' observed Mr Suffield, 'that Alan would turn up trumps: though he might have let us know about his *matinée*. Let's spend a shilling—it's Christmas, you know—in congratulating him.'

'And he's going to make his fortune!' said Mrs Suffield meditatively, with her eye on Isabel. 'I have heard that a very successful dramatist makes in these days of high prices and "No fees" as much as Fifteen Thousand a year!'

'No, mother!' exclaimed Euphemia.

'That must be a very successful dramatist, indeed, my dear,' said Mr Suffield.

'What about this telegram of congratulation?' said George.

They discussed the wording of the telegram for some time; for Mr Suffield—who had a card and a telegraph form and a pencil, which he meant to use himself—would hear of nothing but 'Many happy returns.—Returns, don't you see? There's nothing a manager or a playwright values so much as *returns* and *many* of them.' It was at length conceded that the phrase upon which he had set his heart should stand, but that there be set in front of it this: 'We congratulate you on the production of your play.' That done, they all signed it, as if the handwriting could be transmitted, in manner following: 'GEORGE SUFFIELD; JOAN SUFFIELD; EUPHEMIA; GEORGE.'

George paused, before handing it to Isabel, to count the words. Reckoning the address, there was only room for one word more to complete the shilling's-worth. 'There is only one more word wanted,' said he: 'you had better sign "ISABEL."—That will do very well,' he added with a smile; 'it will look like a Suffield manifesto.'

Isabel did not like it; but she wrote as was suggested, saying to herself, 'What does it matter?'

After breakfast, she went into the garden with Euphemia, and sauntered up and down among the flower-beds, as we saw her at the beginning of this story; but the beds were now bare and waste as her heart. There George soon found them; and seeing him coming, Phemy found an excuse for leaving her, and she prepared for what she knew was coming.

'Do you remember?' he said. 'It was last Whitsuntide that I saw you and Phemy here; it was in the beginning of the day that I spoke to you of something. Do you remember it?' he asked.

'Yes,' said she with self-possession; 'I remember it.' She remembered, too, that on that occasion she had come upon Alan Ainsworth in the conservatory.

'I asked you a question then, Bell, and you put me off; and then I begged that I might put it again in a year. It is less than a year; but I have found a year too long to wait. Tell me, Bell, am I right in thinking that you *quite* understand why I have asked you to come here this Christmas?'

'Quite,' she answered.

'Then,' said he, intensely moved, 'I may ask the question?' He took her hand and paused; the pause was not long, but it seemed long to Isabel.

'May I take the question as asked?' said she, looking down and making arabesques with her toe on the gravel.

'Bell!' he murmured. 'Then—then you accept me?'

'I do, George,' she answered. For an instant she looked him frankly in the face, and then dropped her eyes again.

'Oh, my dear!' he exclaimed, and folded her in his arms before she was aware.

To that she submitted; but when he ventured to press closer and to seek to kiss her, a sudden dislike of his embrace seized her, and she put him away. 'Not now, George!' said she—'not now!' and fled into the house.

George might have thought there should have been more in the asking of a wife than he had found; but if he did think so he did not show it. He went about exuding happiness. That he had come to the understanding he desired with Isabel was apparent; yet it was formally made known to his parents. Suffield took Isabel aside to welcome her as his prospective daughter-in-law.

'I'm glad, my dear,' said he, pressing her hand; 'it's what I've wished for. Though lately,' he added, 'I had got to think that it was going to be Ainsworth.'

It was a busy Christmas Day. They all went to church in the morning, and exchanged greetings and salutations of 'Merry Christmas! Merry Christmas!' on this side and on that. They returned to find the post-bag just arrived: the post is always late on Christmas Day. The bag was crammed with Christmas cards and greetings addressed to every member of the family; for the Suffields now had droops of friends. For Isabel there was but one; yet even that she was surprised to receive, for she had told no one she was coming to Lancashire for Christmas. When she recognised the handwriting of the superscription, her heart beat ominously: it was Alan Ainsworth's. She opened it before them all, recklessly, for they all were occupied with their own communications. Her envelope contained a letter as well as a card of greeting. She read the letter eagerly, greedily. 'I owe you,' it ran, 'and my good friends with whom your servant has told me you are staying' (He had called, then!), 'an apology for the business of this afternoon. It seems rude and ungrateful, perhaps, but my only reason for not confiding to you the secret of the production was that I was afraid the play might fail. That was why I also suppressed my name. I don't think I could have looked any of you in the face again if you had known, and all the world had known, that it had failed. I know you will all rejoice with me that it has not failed, and that there seems the prospect of a long run before it. There are seats ready for you as soon as you are ready to accept them. Are you returning to town soon? I wish to see you to explain matters.'

When Isabel read that aloud—except the final sentence—to the family, George was silent and frowned a little, though no exception could be taken to anything he had heard read.

'We're going back to London on the last day of the year,' said Mrs Suffield: 'we have several engagements to fulfil. Will that suit you, Bell?'

'Oh, quite,' answered Bell.

The rest of that eventful day was crammed with gaiety and feasting. A good many guests came to dinner, and after dinner there was merry dancing; and so the time passed without thought. It was not till she had retired to her room very late that Isabel had leisure to consider what she had done and who she was. She was the affianced wife of her cousin George! She had promised to marry him!—to tie her life to his! She did not shudder at the thought of him; she was only dully miserable. This seemed to her a very poor conclusion to have reached. She was like a religious enthusiast who, after having had visions of heavenly glory, dreams of a divine presence and expectations of fulfilled prayer, suddenly finds himself shut in with a mere reality of earth, which causes him to doubt all he had formerly believed, and to despair of all he had formerly hoped for. When she had lived her simple, tedious, untrammelled life of schoolmistress, what thrills of joy were hers, what dreams of happiness! It was only now she recognised how much she must have dreamed, when she knew she was tied to a reality which was the fulfilment of nothing she had ever dreamed of or had longed for. Oh, what romantic visions she had had of heaven and earth filled with delight!—of Love that with its light and warmth would blend all the varied experiences of life into one Joy—of 'Love the gift, and Love the debt!' Now all that was done with; the whole world was become gray and dull, and shrunk to a wretched round of going out and coming in, eating and drinking, sleeping and waking! And she herself, in her folly and blindness, had wilfully chosen this result! No one but herself was to blame! Why had she been so precipitate? Alan Ainsworth promised explanations! Perhaps she had misunderstood him!

'Oh, my love! my love!' she moaned in her anguish, pressing her hands to her eyes as she paced up and down her room. 'What have I done? What have I done?'

Yet George seemed satisfied and happy. He was not to blame; and how could she take his happiness from him? She knew, now that she had been put to the touch, that she did not love him at all, as a woman ought to love a man with whom she means to identify her life; but that was not because he was unworthy of her love. She now saw, too, that in committing outrage on herself she was doing wrong to George, who by her was prevented from knowing the unreserved, romantic love of another woman! Yet George was happy in loving her and in believing she loved him.

Next morning she went down to breakfast, resolved to show no sadness or regret: it would be the merest selfishness to trouble others with her vain feelings. It was remarked that she looked pale and had dark circles under her dark eyes; but she declared it was nothing: she had not slept well, she said, and her head ached.

The day was filled with engagements: a mid-day dinner in the school-room to the work-people, and a tea afterwards to the children, and last of

all, a family visit to the theatre. But yet there were intervals for private conference, of which George assiduously tried to avail himself. He sought to enjoy the accepted lover's privilege of sitting close to and embracing his mistress; but these endeavours Isabel did her utmost to defeat. And George was not offended; for he set her conduct down merely to the coyness usual in a maiden. Isabel made one or two faint efforts to shake his belief in her.

'Are you quite sure,' she asked once, 'that I am quite the woman you ought to marry?'

'Look here, Bell,' said he; 'don't ask such absurd questions: they are not suited to my intelligence. I have not known a great many women; but I don't need to know any more to be able to tell that the woman I have chosen is the one woman in the world for me.'

After that, what could she say that would not be simply a repudiation of her promise to him?

At the same time she was troubled with the necessity of sending Alan Ainsworth an answer to his question: When would she be at home? Should she write to him that she was engaged to marry her cousin, and she had better communicate with him no more? But would not that be attributing an intimate importance to the situation which he might fail to understand? She ended by sending him a line merely: 'I shall be home on the last evening of the year.'

(To be continued.)

CORNISH TIN-MINES.

Tin is decidedly the most interesting of the mineral treasures of Cornwall. Even in the days when recorded history was not, the Cornish tin was in some rude fashion mined and rendered usable for the purposes of man. The trade so carefully fostered by the Phœnicians was developed during Roman times, only to be neglected when the Saxons and Danes struggled for the mastery of England. It was revived in later centuries.

The earliest tin-mining was of the type known as 'streaming,' and was of course conducted at or near to the surface. The streams of tin were parcels of the ore that at some remote period had been detached from a lode and swept down-hill, most probably by alluvial denudation. Carew, in his 'Survey of Cornwall' (published in 1602), quaintly considered the denuding force that originally laid bare the surface tin deposits to be 'Noah's flood.' The primitive streaming operations were carried on with rude implements of stone or bronze, pickaxes of deer-horn, and subsequently, wooden shovels. With improved tools the miners were enabled to carry their quest farther into the earth; and shafts and tunnels were excavated, and mining for tin gradually developed until its present condition was attained. Much of the Cornish tin, especially before the beginning of the present century, found its way to London; and an important factor in determining the price of the article was the element of risk involved in the long voyage necessary to place it on the London market. The tin-merchant knew how to take advantage of these risks; and when non-occurent, to invent imaginary ones to take their place. Rigging the market was an operation quite as well understood three

centuries ago as now, for—to quote once more from Richard Carew—‘About the price there groweth much adoe betweene the marchants and the owners before they can jumpe to an agreement. The marchant unfoldeth his packe of strange newes, which either he brought with him from London (where most of them dwell) or forged by the way, telling what great likelihood there is of warres, what danger of pirates at sea, how much of the fore-bought tynne lieth on their hands, &c. The owner, on the other side, stoppeth his eares against these charmes, answers his newes with the Spaniard’s “Credo en Dios,” encounters his reasons with the present scarcitie and charges of getting and working tynne, and so keeping up the price.’ Carew then goes on to observe very shrewdly that ‘in the end, after much bidding and bowing, varying and delaying, commonly that marchant who hath most money to bestow and that owner who hath most tynne to sell doe make the price.’

Enterprise at the present day is rather devoted to developing the tin mines already in existence than sinking new ones. The miner or miner of bygone days was a tin-finder as well. Even at the present there is ample opportunity for the exercise of the tin-finding faculty in tracing the direction of the veins of metal under the surface and ascertaining the best position for shafts—arts which tend to secure the maximum of ore with a minimum of labour.

Science has done much in assisting the metal-seekers in their arduous tasks; but still there is no golden rule to simplify the tin-seeker’s work. They say: ‘Where it is, there it is;’ and again: ‘By cutting the ground the metal is found’—both pieces of tin-lore that practical experience has over and over again proved by demonstration to be true. Occasionally, it happens that a lode has been discovered by accidental means. The wearing of the high-roads has more than once revealed the evidences of a rich deposit of tin beneath. The run of a lode has sometimes been discovered by the want or weakness of the grass along a particular section of a field. These instances, however, are but the exceptions to the general rule that tin-mining calls forth the best energies and intelligence of the seeker after subterranean wealth. It is the play for these two qualities that tin-mining affords which has done so much to develop the Cornish miner. In addition, he possesses resourcefulness and independence in a very marked degree. He is no mere underground labourer, as many miners admittedly are; he often works for his own hand, his remuneration being largely dependent upon the success that follows his intelligence and energy in exploiting a new venture. All over the world the Cornish tinman is in request as a miner; and during the Australian gold-fever, many of the steady persevering gold-diggers who amassed considerable wealth had received their training in English tin-mines.

The hardships and difficulties of a Cornish miner’s life are of the greatest. When it is borne in mind that in some of the mines there are upwards of fifty or sixty miles of shafts and tunnels, and that often a miner’s work lies in narrow tunnellings remote from the shaft, it will be seen that his life is no easy one. In some cases the metal has to be followed through ser-

pentine or granite, in others it must be tracked through adhesive beds of slaty clay. The tunnels are small, the air none of the freshest, and the temperature considerably higher than at the surface. Active exertion in a hot atmosphere means copious perspiration; and the miner tries to guard against resulting risks by wearing underclothing of thick flannel. His outer apparel consists of a suit of coarse canvas, which, whatever may be its original colour, soon becomes stained a ‘niry yellow.’ A strong hat, or rather helmet, to protect the head from falls from the roof, and also from incautious contact with the ceilings of the subterranean passages where the tin is sought, completes the attire. In the front of the hat is carried a candle; and the appearance that a miner presents as, thus equipped, with inclined head and bent shoulders, he tramps along the narrow tunnels, resembles nothing so much as Atlas supporting the universe; for the roof of the cavern seems in the uncertain light quite superincumbent upon his shoulders. A still more peculiar effect is produced by the voices of the miners when they are heard in some of the remoter recesses of the mine; the sounds echo and re-echo from the sides of the tunnel, and travel in reverberating measures to considerable distances, seeming to come from a company of gnomes engaged in their underground labours.

To the actual work of mining must be added in many cases the task of reaching that part of the mine where the tin is being worked. It is no exaggeration to state that some miners have spent week after week and month after month three hours per day upon ladders while journeying from the mouth of the shaft to the workings. Of course, where conditions admit, the men are hauled out of the mine either up a perpendicular shaft or along an inclined plane.

When a man has finished his shift below and is about to repair to his humble home on the surface, he speaks of it as ‘going to grass.’ His enjoyments are of the calm and philosophical order; he plunges into no excesses, but employs his leisure in recruiting his stock of health and energy, ready for the next descent to the scene of his labours.

That a good miner makes a good gardener is a remark that the Cornish tinman verifies to the full. He is not only fond of agricultural pursuits, but his little holdings are models of careful spade cultivation. They are as a rule rigorously fenced off from surrounding properties with a precision and completeness rather suggestive of a mining claim than the mere delimitation of a few fields and gardens.

With all his sterling qualities and temperate habits, the Cornish miner is far from being long-lived. A former vicar of St Just, a typical mining district, was once heard to say that he had seen many widows, but not a single widower. The reason is not far to seek. It is not accident, but disease, that makes such terrible inroads in the ranks of the miners. He may slip from the wearying ladder, it is true; a block of rock may fall from the ceiling of the tunnel; or the blasting charge may explode prematurely with fatal results; water, too, may burst into the mine and drown the poor workers like rats in a hole. But though these influences may slay their thousands, diseases born of exposure, first to the heat and

dampness of the mine, and then it may be to the keenness of the outer winter air, undoubtedly may count their victims by the tens of thousands.

One of the most interesting features of mining in Cornwall is the pumping-engine. These triumphs of engineering skill are absolutely essential to the very existence of the mines. The mean annual rainfall for the county of Cornwall is about fifty inches, so that the amount of water that penetrates into the mines must be considerable. In some instances the Cornish engines pump water from depths of two thousand feet; and in one case at least the water that is thus raised to the surface comes from recesses in the earth two thousand five hundred feet from the surface. In the case of mines such as Botallack, where the workings extend beneath the sea, there is the percolation from the sea-bed to guard against. This the miners are unconcerned about, as, when they observe a thin stream come oozing through the roof or sides of their tunnel, they calmly daub in clay with the view of checking the leakage into the mine. A visitor to this mine observed a wooden plug in the ceiling of the tunnel through which the guide was conducting him, and being of a curious turn of mind, he inquired as to its use. When told that the purpose it served was to keep out the sea, he came to the conclusion that he had no desire for further subterranean exploration, and asked his conductor to take him back to the surface forthwith.

Sunday is the great day of the miner's week. He may, during the remaining six days, merit the comparison to a grub, toiling and burrowing in the earth; but on Sunday he removes from him the signs of his toil, dresses himself in sober black, and his company with his wife, spends the day soberly and religiously.

Of the Cornish mines it is perhaps truer than of other English mining districts, that 'A poor surface gives a rich soil.' This is especially applicable to the successful mines. In their vicinity the country has a most dreary aspect. The moorland with its huge blocks of moorstone or granite, and its wealth of heath and gorse, is there strewn with unsightly waste-heaps—small mountains of refuse, which show to what an extent the underground operations have been extended. Piles of mud and pits of slime, too, add to the dreariness of the scene; while the tall chimneys of the pumping, winding, stamping, or smelting works do much to detract from the romance that is generally associated with the county of Cornwall. One sighs for the 'meadows studded with herd and fold,' which are not wanting even in the midst of many of our colliery districts. Among collieries, however, there is little useless material brought to the surface. In the case of the Cornish mines, the tin forms only a small percentage of the roughly-broken rocks which the great 'kibbles' or barrels bring to the surface; hence the barren waste-heaps, the mud, and the slime.

Some of these waste-heaps, though, are barren no longer; they are covered with verdure, not, however, by the hand of man, but by the bounty of nature. These ancient indications of past mining activity go back, some of them, to Roman times; and some bear unmistakable evidence of

having been turned over more than once; for in several instances the rubbish-heaps of early days, when only surface-mining was practised, have been found to cover a rich store of metal deposited in the ground beneath. One feature of abandoned works that is even more striking and impressive than the shapeless heaps of ruin that mark the site of the former surface-buildings, is the occurrence of the deep black pools, most of them, according to local tradition, bottomless, and having in the centre of their bed the shaft leading to tunnels that never again will resound to the click of the miner's pick or the thundering of his mighty sledge. Many of these abandoned workings still bear evidence of their past success or failure. The miners of bygone days used to bequeath their experience to those who came after them by planting the banks adjacent to a prosperous mine with sprigs of elder; while an unsuccessful venture was commonly indicated by blackthorn.

No article dealing with the Cornish tin-mines would be complete without some allusion to the Stannaries or Stannary Courts (*L. stannum*, tin), which in former times exercised almost absolute power over the whole business of tin-getting. By ancient charters, the Cornish tinners were exempt from all other jurisdiction than that of the Stannary Courts save in cases of 'land, life, and limb.' An officer was appointed by the Duke of Cornwall, and was called the Lord Warden of the Stannaries. When he thought it necessary, he could summon the twenty-four stannators of Cornwall to the Stannary Parliament, there to revise old and make new laws relative to tin matters. The last of these parliaments met in 1752; and after that date there was practically no business done in the Stannary Courts. Taxes on tin had been paid to the Dukes or Earls of Cornwall for many centuries. The smelted blocks were carried to certain towns to be coined—that is, stamped with the Duchy seal before they could be sold; and heavy fines were imposed upon persons who attempted to evade the stamping dues. In 1838, however, these were abolished, and the last relic of the old Stannary Courts disappeared, a compensation being awarded to the Duchy in place of the revenue formerly derived from tin.

Many are the crises through which the English tin-trade has passed. Leaving out those which are matter of very ancient history, we find great distress in Cornwall in the year 1727. The scarcity of corn reduced the tinmen to desperate straits. Sir John St Aubyn came forward and generously advanced money to keep them from starving and 'plundering their neighbours.' The last-named reason for Sir John's kindness is clearly indicative of the sturdy resourcefulness that characterised the miners of the early part of the eighteenth century. By 1730, the tin-mines were again flourishing. In 1744, however, another serious danger threatened the industry. England was then at war with France, and the small trading-vessels that carried the tin from Cornwall to London would of course form an easy prey to the French. At this crisis, St Aubyn again came to the assistance of the tinners, and obtained from the Admiralty adequate convoy for the tin-laden vessels.

About twenty years ago a far more serious danger than temporary famine or seizure of tin

cargoes by foreign foes was that which threatened to make English tin-mining altogether unprofitable. Much tin had been discovered in the East, in the neighbourhood of the Straits Settlements, and this sent down the value of the English article to an almost ruinous price. Many of the mines ceased working. The miners sought fresh fields of labour in foreign lands, and the prophets of ill averred that in a few years the British tin-trade would cease to have any save an historical importance. In 1870 and 1871 the price of tin was much inflated. Then came the importation of Australian and Straits tin, and prices dropped, and continued to drop to the great distress of the miners and shareholders.

The history of the Wheal Owles Mine during this crisis is most interesting. The Wheal Owles is one of the St Just group of mines, and was the scene of the recent lamentable flooding, when so many brave men lost their lives. When the crisis came, the managing director or 'purser' resolved that he would not sell 'black tin' at a less price than sixty pounds per ton. Black tin is the metal that has undergone the stamping and the washing process to separate it from some of its rocky impurities. It has also had other matter burnt out of it, and is ready for the smelter's hands. The mine was then in the hands of a few well-to-do 'adventurers,' who could afford to try the experiment. Accordingly, no tin was sold, and it was stored in great quantities in hutchies. A wealthy banking and smelting firm advanced the necessary money for carrying on the mine on the security of the stored black tin. This policy was commenced in 1875; and in 1878 the price of pure tin had fallen to sixty pounds per ton, and the crude article to forty pounds. The debt at the bank was £24,000, and the interest of course considerable. Still the 'purser' held on, and no tin was disposed of; and in 1881 and 1882 the reward came. The market went up, and the shareholders were enabled to realise far higher prices than the minimum below which they had resolved not to sell.

JOHN UPCRAFT'S CRIME.

CHAPTER V.—CONCLUSION.

WHEN the sense of stupefaction passed away, Upcraft became aware of a figure bending over the railing at the foot of his bed and peering inquisitively into his face. 'It's you, is it?' said the figure.

If he had needed any confirmation as to whose step he had heard or as to what manner of man stood there, he had gained it now. As the man spoke, he raised his shaggy eyebrows, feigning, as it seemed to Upcraft, the utmost surprise. He was enveloped in a thick gray dressing-gown. The light from the fire flickered upon it, and upon the old and cunning face of Mr Bryce.

At this moment Jess opened her eyes; she looked in bewilderment round the room.

'So this is the man you're nursing, is it?' said her father. 'It's just as well that I took it into my head to have a look at you, eh?'

Jess made no answer; but she kept a watchful look on his face.

Mr Bryce rose from his leaning posture at the foot of the bed and crossed over to the fire, where he stood very much in the attitude in which Jess had seen him in the library a few hours ago. He stretched out his hands to warm them while glancing at Upcraft over his shoulder. 'Now listen to me,' said he, with a crafty look out of the corner of his eye, 'for I'm going to speak plainly! Let me advise you to weigh every word before you answer me. Shall I go on?'

'Go on,' said Upcraft; 'I'm listening.'

'In the first place,' said Mr Bryce, 'I'll ask you a question. Do you still realise that you are a convict at large? Answer me that!'

There came a look of anger into Upcraft's eyes: Jess felt the hand she had given him pressed convulsively; but he made no answer.

'It's fortunate,' Mr Bryce went on, with a nod of satisfaction, 'that no one here—at Thurrock Hall—knows anything about you. You are Miss Jessie's patient—that's all. Your identity is known to no one, except us three who are here together.'

Upcraft looked into Jessie's face. 'Is that true?'

Jess answered: 'Colonel Woodward knows who you are; no one else knows.'

Mr Bryce cast a meaning glance at his daughter. Then he said: 'Now, listen to what I have to propose.' He walked across the room and back again thoughtfully; then he resumed his attitude over the fire and looked with evident mistrust at Upcraft.

'Well?' said Upcraft, impatient at his hesitation; 'you have something to propose, you say. What is it?'

'I was only wondering,' and there was still mistrust in Mr Bryce's manner, 'whether, as a medical man, it would not be wiser to put off my talk for a few days. I don't want to alarm you,' said he; 'but you've a feverish look in your eye which I don't quite like.'

'You are too considerate,' said Upcraft, in a tone of irony.

'Not at all,' said Mr Bryce.

'Then say what you have to say,' said Upcraft; 'now or never.'

'Very well,' was Mr Bryce's reply. 'You have had your warning. I'll only advise you, as a professional man, not to let anything I may say cause you undue excitement. The matter is a very simple one. You very naturally desire, under existing circumstances, to keep your presence here unknown—unsuspected.'

'I did not say so,' said Upcraft.

'Tut,' said Mr Bryce, with a wave of the hand. 'It's understood, then—it's understood.'

Upcraft offered no comment. He clasped his hands behind his head and looked fixedly at Mr Bryce. Jess stood at the bedside between the two, frequently looking from one face to the other.

'When I reminded you, rather bluntly just now,' Mr Bryce resumed, 'that you were a convict at large—an outlaw—I had a distinct motive for doing so. I wanted you clearly to understand your position. One word from Colonel Woodward, or from me, would send you back to the prison from which you escaped three years ago.'

An odd smile passed over Upcraft's face at

these words. But Jess looked with abject dread at her father.

'But you won't give him up, will you?' said she. 'You won't betray him now?'

'Why, no—no,' said Mr Bryce in his most plausible tone—'not if he agrees to my conditions.'

'Conditions?' said Upercraft, closing his eyes for a moment, as if the better to comprehend. 'What may they be?'

'Simply that you give up all thought of holding my daughter to her engagement: that you lose no time, when restored to health, in making arrangements to quit the country for once and all: that you give your promise, in a word—having been provided with money to live abroad—never to show your face again!'

'And if I refuse?' said Upercraft, opening his eyes and looking searchingly at Mr Bryce.

'Those are my conditions.—If you refuse,' Mr Bryce resumed, 'I shall report you at headquarters; and before a week is out, you will find the handcuffs on your wrists again, and a prison van waiting for you without!'

Upercraft could control himself no longer. 'You coward!' said he, leaping up from his pillows as if he had some thought of springing at Mr Bryce's throat. 'By what right do you presume to dictate terms to me? Your step along the footway through the wood still rings in my ear. Look to your own wrists! For I may yet be tempted, if goaded much further, to put Woodward on the track of the man who tried to murder me in Thurrock Wood!'

At this fierce and unexpected retort, Mr Bryce was completely dumfounded, but only for a moment. He quickly recovered himself, and turning to Jess with a hypocritical air of concern, inquired: 'Does he often rave like this?'

Jess looked thoroughly amazed. If there was any reason in Upercraft's utterance—if it were not a mere feverish outburst of meaningless passion—her father was the direct cause of this grave calamity. As the words sunk into Jessie's heart, their truth became clearly manifest; they seized upon her imagination with irresistible force; and the whole scene of the attempted crime passed before her eyes. Her father had quitted the cottage soon after Upercraft's departure. He had crossed the fields, and had taken the footway through the wood to Great Thurrock Station. There he had seen Upercraft, followed him, and struck him down. She looked at Upercraft as if for some further confirmation. But he had fallen back upon his pillows, and lay there so pale and motionless that Jess became seriously alarmed.

Mr Bryce stepped forward and more closely scrutinised Upercraft's face. 'Out of danger, eh? I don't know so much about that! He's still delirious. Why, my dear,' said he, 'why didn't you give me a hint? You heard me warn him, didn't you? He's in a high fever. I should give him a cooling draught at once.—Good-night!'

Having uttered these words in a soothing, professional tone, while bending over the patient, Mr Bryce went out, treading softly down the passage, as if unconsciously trying to disguise the sound of his own footsteps.

Towards nightfall on the following day, while Woodward was alone in the library, a visitor was

announced. He was a dark man with a closely shaven face; and there was a sporting cut to his dress which added to his general appearance of wide-awakefulness.

Woodward received him with the eager question: 'Any news?'

The man nodded. He was a detective whom Woodward was employing to search into the matter of the attempted murder of John Upercraft.

'Is Mr Bryce here?'

'No,' said Woodward.

'At home?'

'Yes; he went home this morning.'

'I've business with him.—My dogcart is outside,' said the man. 'Will you drive over with me? I'm on the track at last.'

'Can Mr Bryce help you?' said Woodward, with surprise.

'Nobody better!' said the detective.

Woodward took his seat in the dogcart at the detective's side, and they flew along over the melting snow in the growing dusk of evening.

Mr Bryce, who sat in his easy-chair, grasped the arms vigorously as the two men were shown in. He looked startled. There was a wine-glass and an empty bottle of port on the table at his side; and the effects of the wine were apparent in his flushed face and thick utterance.

'Woodward?' said he. 'And who's your friend?'

'Sharp,' said the man, 'from Scotland Yard. I've a warrant, Mr Bryce, for your arrest on suspicion of being concerned in that affair in Thurrock Wood. May I trouble you?'

Mr Bryce, still grasping the armchair, rose up and stood erect before his visitors. The detective stepped forward and held out a pair of handcuffs invitingly.

A stifled oath—a gasp for breath—and Mr Bryce, reeling forward, clutched at his own throat, as though wrestling with some demon, and then fell in a heap, face downward, in front of the hearth. They lifted him back into his chair. They looked at each other. After a pause, the detective said: 'There's no need for handcuffs here.'

For some days Upercraft's relapse caused grave anxiety; but he slowly regained strength; and, strangely enough, as Jess remarked, he never spoke one word to her that showed any distinct recollection of her father's midnight visit.

One bright spring day, Jess had wheeled Upercraft's chair to the open window. She was more a companion to him now than a nurse; and as the need of her as a nurse diminished, she became conscious of a growing change in John Upercraft which seriously perplexed her. He seemed to be drifting from her. 'I shan't trouble you much longer,' said he. 'I'm mending fast. In a few days I shall be well enough to quit Thurrock Hall.'

'Trouble, John? You are a trouble to no one.'

'Not even to Woodward?'

'No. It is ungenerous to think so,' said Jess. 'There is nobody more hospitable in the whole county!'

'You know best,' said Upercraft.

'John! How strange you are,' said Jess. 'What is in your thoughts?'

'I was thinking about myself, I'm afraid,' said he. 'What is to become of me? What have I to live for now?'

'I don't know,' said Jess archly, 'unless it's for me.'

'For you, Jess?' said Upercraft, with surprise. 'Aren't you going to marry Woodward?'

'I? You must be dreaming.'

Upercraft's face brightened. 'How could I have ever had a doubt? Why, Jess, this is the second time you have saved my life! If I had needed any proof—if in all these years you had ever given me the slightest cause to doubt you—your devotion to me during these terrible days, while I was lingering between life and death, should have convinced me that I had no right to think that your love was changed!'

The ice was broken. They were lovers once more. And now he told her what had passed between him and her father on that misty afternoon at the cottage in the marshlands, and how he had subsequently entered the bar-parlour at the 'Old Hulk,' where the gossips had copied her name, as he thought, with Colonel Woodward's.

'It is possible,' said Jess; 'I have been much at the Hall. Miss Woodward is my friend. Her brother and I have been thrown together. I like him, and - and?—'

And then she hesitated, and looked out upon the park, and thought of what had happened there in the snow-storm on that memorable afternoon. Then she related to Upercraft every detail of the scene.

They now spoke freely to each other of all that had happened during their three years of separation.

'After bidding you good-bye, Jess, on that dreadful night,' said Upercraft presently, 'I went abroad. After a number of adventures, of which I will tell you another time, I reached "Frisco." There I got work in a silver mine, and began to make money.'

'But why,' said Jess, 'why did you never write?'

'I feared my letters would be intercepted,' said Upercraft. 'I could not trust your father. I thought of coming home and seeing you, and returning to the States. But I never could make up my mind. But at last something happened which decided me.'

'What was that?'

'It happened at a grog-shop. Some men were gambling at dice. A quarrel arose. Words led to blows. A pistol-shot was heard, and one of the gamblers fell. I ran to lift him from the ground, and instantly recognised him. He was an old fellow-clerk in the London house. He was seriously wounded, and lived only a few days. Before he died, he wrote a confession, which was signed and duly attested. It was about that forgery: and it is now in the hands of my lawyer. It sets forth how some half-dozen drafts, which I had been accused of having forged, were forged by him. He had put one of them among my papers.'

'How cowardly!'

'Yes,' said Upercraft. 'When he heard of my escape from prison, the little courage he had utterly failed him. He was in mortal dread that I should make my appearance at the office

and boldly accuse him of the crime. He was conscience-stricken, and he lived in fear and trembling. At last he left England, and wandered from one country to another, and so came across the man he least desired to meet.'

'It was fated; wasn't it?'

For a while they were silent. Then Upercraft said: 'I was on my way to the Hall, after quitting the "Old Hulk"—resolved to visit Woodward, and do my utmost to induce him to give you up—when I met with that trouble in Thurrock Wood. You know the rest.'

Upercraft was re-established as head-clerk in the house from which he had been dismissed as a criminal more than three years before. Soon afterwards, Jessie became his wife.

Woodward travelled for a while. Then he came home, and settled down with his sister at Thurrock Hall. Jim, when big enough, was taken on as under-gardener; and Mrs Gilkes found a home at one of the park lodges. She never observed anything queer about her son, when the signal-gun went booming over the marshlands on any subsequent occasion; and so she came to conclude that Jim had 'grown out of it' at last.

THE BRITISH SOLDIER AND HIS CHAPLAIN.

It is a matter for congratulation surely that the British nation, while it cares for the physical and material needs of its soldier-sons, does not forget that they have spiritual needs also: it credits them with something more than mere physical frames to be kept strong and in good fighting trim. 'Tommy Atkins,' while he has a strong arm to strike for his country, has a heart also to feel and sympathise. He is a man, not a machine; and has necessities other than those which can be met by the daily food-rations. And so England, recognising these deeper needs of her brave lads—needs which may not be always apparent on the outside, but which are none the less real—has her 'Chaplains' Department' in connection with the army. And there are never wanting men who in this path of duty are proud to go forth under her standard, not to fight, unless, indeed, some stern necessity should arise—then they can—but rather to enhearten the men, and to keep them in touch with that higher duty which embraces and covers all the lesser but essential duties of their soldier-life. The men are none the less unshaken in discipline and plucky in fight because of their Sunday morning parade service, or the quiet word of comfort and friendly sympathy spoken in the hospital or the barrack-room; or the knowledge that should they die in the service, words of Christian prayer will be reverently spoken by their graveside, even though they be laid away to rest in some far-off land, or on the red field of strife itself.

Through many long years it was my happy lot to be engaged in this work at home and abroad, both in the piping times of peace and amid the more stirring episodes of the actual battlefield. I say advisedly it is a happy work, for no clergyman or minister need wish for a more grateful and responsive constituency among whom to toil

than the lads of the British army. They are often misunderstood; sometimes, indeed—and I say it with shame and indignation—looked down upon and scorned; but I testify—and so will many another who has lived among soldiers and *knows* them—that some of the grandest qualities which go to make a noble character in man I have seen exemplified over and over again in the British soldier. Take him all round, he is a better man than those of his own station in civil life. Perhaps he ought to be, because the army is a great school of discipline, where many a man who through sheer weakness of character would very probably drift into evil ways in civil life, just gets that stiffening and backing up which he needs to keep him straight, and ultimately to turn him into a very decent fellow. Whereas, if he be utterly and irretrievably bad, he is soon ignominiously kicked out of the army, as he would be from any other decent society.

With regard to the work of the chaplains, the military authorities recognise four 'religious parties' in the army—Church of England, Presbyterian, Roman Catholic, and Wesleyan; and every soldier when he enlists is required to declare his 'religious persuasion,' he being 'at full liberty to attend the worship of Almighty God according to the forms prescribed by his own religion.' There are about eighty commissioned chaplains belonging to the first three parties: the Wesleyans, while having their corps of chaplains, and serving both at home and in campaigns, preferring not to accept commissions. This somewhat militates against the efficiency of their earnest and otherwise fully recognised work in the army; and it is perhaps regrettable that they do not choose to stand on the same platform as their co-workers. These commissioned chaplains are divided into four classes, according to their seniority, ranking respectively as Colonels, Lieutenant-colonels, Majors, and Captains; and headed by a Chaplain General—at present Dr Edgihill—who is at the War Office. The pay of a military chaplain is not great, ranging from 10s. to £1, 2s. 6d. a day; and he retires on pension when he has completed twenty years' service; except under special circumstances, when the term of service may be prolonged. He is not entitled to special fees for the performance of any duty whatever for officers and men, such as furnishing copies of certificates of baptism, marriage, or burial. His duties embrace the conduct of the parade and voluntary services in the garrison church on Sunday morning and evening respectively; the regular visiting of the sick in hospital, and of the soldiers' families in the married quarters; and the weekly religious instruction of the children and drummer-boys. These, however, are the barest lines of his duty. There are a thousand other ways by which, if a chaplain would do his work effectively, he must come into sympathetic touch with the men. No rules or regulations can make a chaplain really efficient if it be not born in him from the first. There are special instincts, intuitions, and natural powers which are essential, and which, if he have them not, he had better relinquish the work at once and for ever. I have known a chaplain who regarded the officers' mess as an unholy place, and its inmates as men to be avoided rather than

influenced; and others who looked upon the men in the ranks as beneath any kindly notice beyond what bare duty demanded. Such men are failures, and worse. On the other hand, the chaplain who is brotherly and sympathetic in the hospital, who has a cheery word for the men when he looks in upon them in the barrack-room, and who comports himself as a manly Christian gentleman in the officers' mess, is the success. The poor sick lads look eagerly for his coming, the men in the rooms hail his presence, and the officers welcome and respect him. He it is to whom the men will tell the sad secrets which perhaps have long been locked up in their own breasts; and oftentimes he is privileged to be the happy instrument of effecting a reconciliation between the runaway lad and the anxious parents, who probably know not the whereabouts of their wandering boy.

The soldier is very quick to detect the right man—the man who is his friend and well-wisher; and for him he will do anything. But woe betide the one whose ministrations he resents! There are many little ways in which he can show it without bringing himself within the reach of reprimand. The remarkable restlessness at parade service, the sudden and strange somnolence which invariably seizes the men in hospital when such a chaplain crosses the threshold, and the scantily attended voluntary service, are all indications of 'Tommy's' displeasure. Indeed, I heard of one acting-chaplain in a large garrison town who with remarkable discretion told his military congregation that soldiers were simply 'paid cut-throats and robbers.' The sergeants of the particular regiment quartered there met together, and sturdily refused ever to hear that man again; and what is more, their commanding officer did not compel them to do so.

To a man of the right stamp, the work of a military chaplain is full of happiness and encouragement, delightful alike in its experiences and in its after-memories.

THE MONTH:

SCIENCE AND ARTS.

WHEN, sixty years ago, George Stephenson prophesied that his newly-invented iron horse would achieve a speed of a mile in three minutes, his words were regarded with incredulity. Possibly the great inventor himself would have been incredulous if he had been told that the locomotive engine would be gradually improved until the three minutes in which a mile could be covered would be reduced to thirty-two seconds. This marvellous speed was actually attained lately on the New York Central Railway, and for some distance a speed almost as great was maintained. One can hardly realise what such velocity means; for it is faster travelling than anything short of a projectile from a gun that we are acquainted with; faster than the 'wings of the wind,' or the flight of the swiftest bird. In every second of its progress along the rails, the American engine while maintaining the speed stated above covered a distance of one hundred and sixty-five

feet. It is very doubtful if a higher speed than this is possible, for the resistance of the air is a very important factor.

The lectures by Professor Dewar on the Atmosphere and Liquid Air, which have aroused so much interest at the Royal Institution, and are believed to be among the most remarkable ever delivered in that historic theatre, came to a conclusion with an experiment which has never before been performed—namely, the synthesis of air. Every schoolboy knows how to *analyse* the air in a rough and ready manner by burning the oxygen and leaving the nitrogen. Professor Dewar mixed together fluid nitrogen and fluid oxygen in the proportions necessary—about four to one—to constitute the air we breathe. When these lectures are published, they will be read with avidity by the scientific men of all countries.

Fish is notoriously the most perishable form of food, and the kind which for that reason is most unpalatable when not perfectly fresh. It therefore seems to be a marvellous achievement to deliver in London, in first-rate condition, a consignment of fish which is the produce of Australian waters. These fish were recently on view in the Victorian Court of the Imperial Institute; they are of a kind not met with in Britain, and were brought, together with a large quantity of fruit, by the screw steamer *Oceana* from Melbourne.

During the recent drought, an experiment was tried in South Lincolnshire which is worthy of imitation by those who are within reach of water. This was on the farm of Swineshead Abbey, which is intersected by one of the arterial fen drains. By aid of a powerful fire-engine, the water from this channel was pumped over the land in the form of fine spray at the rate of eighty tons per hour. The engine was fixed at a convenient centre, and flexible tubing several hundred feet in length carried the water from it over a large area. Many agriculturists visited the farm, and they pronounced the experiment a complete success. There are many farms situated near reservoirs, lakes, and rivers which, in times of drought, might be benefited at small expense in similar fashion.

A French paper publishes an interesting account of a new industry in Algeria which utilises the dwarf-palm of that country, a tree which hitherto has proved to be one of the chief obstacles to clearing the land, for it is profuse in its growth, has most tenacious and wide-spreading roots, and is most difficult of eradication. Various uses are now made of this tree, but the principal is the extraction of the fibres which are found in the leaves and stems. The industry is of twofold benefit to Algeria, for it clears the land of the obstructive tree, and employs a large amount of Arab labour at the numerous factories which have arisen during the past few years. The leaves are first of all plucked, then sorted by women and

children, and lastly combed in a rough form of carding-machine, the principal part of which is a rapidly revolving drum with nails fixed upon it. With this rough appliance a man is able to card upwards of one thousand pounds of leaves per day. The fibre is subsequently curled or twisted, and can then be used for stuffing chairs, couches, and other articles of furniture.

The French scientific journal, 'La Nature,' recently published an article, interesting more especially to military men, which gave details of the method of crossing rivers by means of leathern bottles. The said bottles are made by utilising the hides of cattle which have been necessarily slaughtered to feed the soldiers; and in order to turn them to account the animals must be skinned in such a way as to leave the hide as whole as possible. The holes representing the places of the legs and neck are then tied up, and the skin, blown full of air, possesses sufficient buoyancy to support two men in the water. In practice these huge air-bottles are fastened below wooden rafts, which can be rapidly put together or taken to pieces.

Among the many methods of utilising waste products may be mentioned the employment of sawdust in making building-bricks. The sawdust must be dried, and all coarse particles and chips separated from it, after which it is mixed in the following proportions: Two bushels of sawdust, one of cement, and five of sharp sand. When these ingredients have been well mixed in a dry state, two bushels of slaked lime are added, and the whole incorporated and pressed into moulds. The product is said to be satisfactory and cheap.

A curious result of issuing coin of much less intrinsic value than the sum which it represents has occurred in the United States, where for some time the dollar has only contained sixty cents-worth of silver. Some astute counterfeiters have made a quantity of dollars containing the same amount of silver as those issued by the Mint, and from the latter they cannot possibly be distinguished. The question thus arises whether a Government which issues coins of a fictitious value can prosecute individuals for doing precisely the same thing.

In a paper recently read by Mr John Ritchie of Edinburgh, before the Royal Scottish Society of Arts, on the 'Utilisation of Water for Power,' the most modern appliances for obtaining power from water were fully described, including those more especially intended for electric lighting. The lecturer has carried out several installations of this character, in one case utilising a head of water of six hundred and fifty feet, and obtaining from it thirty-five horse-power by driving the whole of the water through a six-inch riveted steel pipe. In the course of his remarks, he pointed out what an enormous amount of power was at present running to waste, which might be applied to the benefit of landowners and manufacturers.

It is interesting to observe that both water and wind power are now receiving renewed attention at the hands of engineers. All over our country there are watermills and windmills which have been abandoned, and are going to decay. Artists know where to find them, and are the first to deplore the fact that improved methods of milling corn have rendered these picturesque places

obsolete. But, as we have just seen, water is once more being regarded as a valuable source of energy, but with the dynamo-machine yoked to it as a distributor. As to wind-power—improved windmills have a department all to themselves at the Columbian World's Fair, and although they are not quite so picturesque in appearance as their four-sailed prototypes, they are capable of much more effective work.

A new method of preventing forgery of bank-notes and other documents has been suggested by a German doctor. He states that certain colouring matters can be so prepared and combined, that when paper is dipped into the mixture each tint will penetrate the fibre at different speeds, the result being that the paper will assume a streaked appearance, each layer absorbing a different colour. The exact means by which this result can be brought about are not specified; but it is stated that the plan is practicable, and that it is impossible to imitate the effect produced without knowing precisely how the mixture of colours was made.

An interesting account of the way in which olive oil is produced in Sicily is given by the United States consul at Catania. The olive-tree grows equally well in the valleys and on the mountain sides; but those on the lower ground furnish an oil which is richer, and can be stored for a longer time without deterioration. The grinding and pressing of the olives are performed in a very primitive fashion. First, the olives are placed on a circular platform of masonry about seven feet in diameter, upon which a heavy mill-stone is turned by means of a pole to which a donkey is attached. While the stone revolves, a man is constantly engaged in turning the pulped olives over and over with a spade. In half an hour about one hundred kilogrammes will have been pulped in this way, when the mass is put in soft rush-baskets, which are piled in a heap in the press—an arrangement with a heavy wooden screw, which is worked by six men. About half the oil is expressed in this fashion, the rest being extracted by subsequent operations. The fresh oil is green in colour, and is placed in earthen jars for eight days to settle and clarify. It is then ready for use.

Tobacco has generally been regarded, and has been largely used, as an insecticide. It therefore comes as a surprise to learn from a recent issue of 'Indian Museum Notes' that there is at least one insect which thrives on the fragrant weed, and is so appreciative of a good cheroot as to render that delicacy useless for human consumption. This, 'the cheroot weevil,' or '*Lasioderma testaceum*,' is a little beetle which lays its eggs on the leaf, the said eggs afterwards hatching out into white hairy grubs, which cut their way out of the cheroot, and leave tiny tunnels, which reveal their work and spoil the cigar. The greatest care is necessary in making the cheroots that the tobacco leaves should be free from contamination, for the proposal to subject them after manufacture to a heat of ninety degrees would, while destroying the eggs, spoil the flavour of the tobacco. The same insect will attack stored rice, opium, and other vegetable substances.

An effective method of closing bottles of milk air-tight is credited to a French inventor. The fastening consists of a disc of good india-rubber,

with a nipple or finger which fits the neck of the bottle, projecting from its centre. The bottle of milk is placed in a water-bath until it boils, when it is removed from the water, and the india-rubber stopper inserted. As the bottle cools, a partial vacuum is created inside the bottle, and the stopper is sucked into the neck, preventing all access of air. A metallic cover completes the operation.

Close by the North-western Railway line at Harrow may be seen a circular wooden platform about two hundred feet in diameter, standing upon which is an upright frame fitted with what seem to be Venetian blind slats. This is Mr H. Phillips's Flying Machine, the result of many years' careful experiments with a view to solve the problem of aerial navigation. Many flying machines have been designed with large plane surfaces to rise in the air on the kite principle. Mr Phillips has reduced these surfaces until they resemble, as we have said, the laths of a Venetian blind. The carriage, or frame, tethered to a central post, is driven around the track by a light but powerful steam-engine, which works an air-propeller. A high rate of speed has been attained, and the machine lifts at its rear end about three feet from the ground. The experiment is a promising one, for the machine does more than any of its predecessors; but as yet the problem of flying cannot be said to be solved.

Edison's phonograph has not yet been placed within reach of the public, although we occasionally hear of these instruments being sold at a somewhat extravagant price. It is stated by an American paper that the mixing of the composition for the waxen cylinders is a secret process only known to, and performed by one man.

Teachers of astronomy know well how difficult it is by diagrams or any other means to demonstrate to their pupils the movement of the earth and its satellite with respect to the sun, and they often have to content themselves with such homely appliances as an orange, a knitting-needle, and a candle. Mr J. B. Fisher, of North Parade, Deal, has earned the gratitude of instructors by designing a very beautiful contrivance, which he has named the Volvorb, which is small enough to stand at the end of a schoolroom table, and yet large enough for demonstration before a large class of pupils. The sun is represented by a gilt ball, which can, if desired, be replaced by a paraffin lamp; and the earth moves around it in such a way as to clearly illustrate the phenomena of the seasons with their varying lengths of day and night. Round the earth there moves, when required, a little satellite, by which can be shown the phases and eclipses of the moon. The contrivance works perfectly, and by very simple means, while the mechanism is of such originality as to justify the protection of a patent.

The Select Committee of the House of Commons which is making inquiry into the state of our Sea Fisheries is gathering evidence of a very important and interesting nature. Professor Ray Lankester recommends that our coasts should be thoroughly surveyed, so that the movements and habits of the fish inhabiting them can be better studied; and he asserts that such a survey might be made to pay well from a commercial point of view, for new fishing-grounds would be discovered. He suggests that to carry out this work the

present Government grant to the Marine Biological Association, which amounts to only one thousand pounds per annum, should be trebled, and a further sum of six thousand pounds should be granted for a deep-sea vessel. Dr Günther is in favour of the establishment of hatcheries for the cultivation of sea-fish; and other witnesses have testified to the gradual depletion of the North Sea fisheries owing to the baneful practice of netting immature fish.

A member of the Government Indian Service in Arizona has recently published an account of the manner in which the Apaches prepare their arrow-poison, and he states that although there is no longer any need for the tribe to possess themselves of such warlike material, the process is gone through year after year as a matter of tribal tradition. The recipe for this poison would almost commend itself to the witches in 'Macbeth,' although it is somewhat simpler than the brew which they compounded. The Apaches use only three materials—namely, the heads of about a dozen rattlesnakes, a pint of poisonous red ants, and water. These he mixes together, and places in an earthen vessel, which he lutes with moist earth, previous to putting it into a fierce fire for twenty-four hours. At the end of this time the concoction assumes the appearance of a dark-brown paste, and is ready for smearing upon arrows. So deadly is the poison, that a prick with such a weapon will kill its victim in twenty minutes.

Once more an old scheme for making Paris into a seaport by means of a ship canal has been brought forward; and it is said that nearly half of the total cost, which is estimated at six millions sterling, has already been provided for. The suggestion is that the present water-way between Havre and Ronen should be extended to Paris, so as to enable sea-going vessels to come direct to the French capital. The total length of the water-way would be a hundred and fifteen miles, its depth about twenty-two feet, with an average width of a hundred and fourteen feet. The canal would require only four locks, and in other respects its construction would present no unusual difficulties.

The latest proposal for improved prison construction is that the cell-walls should be formed of thin steel pipes charged with water, so that the slightest puncture would reduce the pressure and cause an electric alarm to sound. Such a method of construction would, we think, be wholly unnecessary. Prisoners cannot escape from modern prisons of the ordinary pattern except with the connivance of their jailers. The days of Jack Sheppard are past.

A terror to dishonest milk-dealers has been contrived by Mr W. Belgrove of 482 Harrow Road, London. It consists of a glass jug holding one pint, with certain engraved lines upon its surface. In the first place it acts as a simple fluid measure, but its other duty is a more important one. Just below the line which marks the pint measurement, and also below that marking half a pint, there are three marks, the top one bearing the word 'Average;' the second one, 'Good;' and the lowest one, 'Very good.' These words are intended to denote the thickness of the layer of cream which will rise to the surface of the milk after a few hours' rest, and are of course

a direct test of quality. The quantity of cream in certain specimens of London milk which we have seen was so small that it would altogether defy measurement.

RUSSIAN RIDDLES.

To begin with, the Slavonic conundrum is not by any means a thing to be laughed at. No light and airy trifle, it entirely lacks the frivolity—some might say the futility—of the British specimen. Luckily for this generation, the tyranny of the English riddle is overpast. Familiarity with such a conversational kill-joy has long been reckoned the reverse of a social accomplishment. Looking, however, at the Russian variety, we at once discover that it is 'no fool,' to use an Americanism. The Muscovite quip is a stern and solid aboriginal fact. Racy of the soil, each riddle contains at least one buried myth and two mummified figures of speech. To unearth and revivify these dry bones requires the philosophic touch of a Max Müller or a Renan, tempered with the Shakespearean hilarity of a First Grave-digger.

Many of these enigmas or riddles are annually trotted out by the old crones as they gossip round the stove during the long Russian winter evenings. When the days of the Christmas festivities come round, the 'chestnut' is an unfailing source of joy. The riddle pure and simple bears a strong likeness in style to the famous riddle with which Samson defeated the thirty men of Timnath. It shows traces of a rude poetic instinct, and often, it must be added, is highly far-fetched. Ralston, in his 'Songs of the Russian People,' quotes a few that bear more immediately on his subject of folk-lore. Some of them are eminently calculated to tax the intellectual powers of the benighted peasant, were it not for the fact that the Russian peasantry have a special taste for figurative expression. Thus, such a phrase as 'The red cock has crowed' is the regular euphemism for the only too common village conflagration. 'To kill the worm,' in plain English, is to have a drink. Of course, such metaphors abound in the slang of all nations. They seem, at any rate, especially to flourish in the land which the rustic still shares with the house-demon and the Will-o'-the-wisp—where the mill-sprite and the water-nymphs have not yet resigned their dominion over the streams, nor lost their power to torment. As Byclinski wrote to Gogol, the Slavonic lower classes are still pagans at heart, with superstitions for religion; and their proverbs and enigmas bear eloquent testimony to the fact. In common with the powers of Nature, such humble domestic objects as the shovel, the broom, and the sieve enjoy the honour of personification, and almost attain to the rank of fetiches. Thus, the oven-fork is disguised in a riddle as an ox with a hayrick on his horns and with his tail in a woman's hands. Soaring into more poetic regions, we find that considerable demands are made upon our guessing powers. It needs some ingenuity to recognise the morning dew under the figure of a maiden's keys, disregarded by the moon, but picked up by the sun. Another popular enigma runs thus: 'A white ox has

restored the world, which a black cow has overthrown.' This is, perhaps, not the most obvious way possible of saying that day succeeds night. The statement that 'There are letters on blue satin which neither learned nor unlearned can read,' is only a periphrastic allusion to the stars in the sky.

Many similar riddles were collected by the Russian ethnologist Khudyakov some thirty years ago. The present writer has jotted down in his note-book a few others derived from various sources. It will be noticed that most of the enigmas are put in the form of simple assertions, and are not, like the English riddles, interrogative. For instance, 'I went down the street, I came to two forked roads, and I walked along them both at the same time.' This apparent impossibility is solved every morning by the possessor of a pair of trousers. Compare the Mexican conundrum, 'What is it we enter by three ways and leave by one?' Answer, a shirt. The two following resemble each other: 'I am blind, but show others the way; deaf and dumb, but know how to count.' 'It has neither eyes nor ears, yet it leads the blind.' A milestone and a walking-stick are respectively implied. 'It flies silently and alights in silence; but when dead and rotten, it roars aloud.' 'People pray for me, and long for my coming; but directly I appear, they hide themselves.' The first is snow; the second, rain. Here is one which requires the commentator's farthing rushlight: 'There is a little dog which turns round and then lies still. It neither barks nor bites, but it keeps you out of the house.' The answer is, a lock. 'A nine-legged bird, which faces the wind and flaps its wings, but cannot fly.' 'It lives without body, speaks without tongue; none ever saw, but all have heard me.' In other words, a windmill and an echo. In the latter connection, we are reminded of the Zulu 'sense-riddle,' quoted by Tylor, 'There's a thing that travels fast without legs or wings, and no cliff or river or wall can stop it—that is, the voice. The following is calculated to puzzle even a sphinx: 'What walks on its head and on foot, and with boots on, yet barefoot, all at the same time?' The solution is, the hobnail in your boot.

Some common objects of the household and the farmyard are thus presented: 'I have four legs and feathers, but am neither beast nor bird.' 'There are four brothers under one hat.' 'If I eat grass, my teeth grow blunt; chewing stone, they grow sharp again.' 'Black, but no crow; horned, but not a bull; with six legs, but no hoofs—what am I?' 'Four brothers run side by side, but never catch one another up.' 'I was born twice over, but not christened—a famous singer, yet over my corpse they chant no dirge.' 'A barrel of wine without staves or bottom.' 'I am not bird or beast, but sharp-nosed, thin, and shrill-voiced; killing me, you shed your own blood.' 'What walks upside down overhead?' The equivalents, taken in order, are as follows: A bed, the legs of a table, a sickle, a beetle, the wheels of a cart, a cock, an egg, a gnat, and a fly. Two miscellaneous queries may be added: 'Who are the two brothers that live on opposite sides of the road, yet never see each other?' 'What can't be caught, though you can see it close?' Your eyes and shadow, respectively.

Besides these somewhat tough and indigestible chestnuts, which serve as strong meat for senile wits obfuscated by 'vodka,' there is a more milk-and-water pabulum for the less robust intellect of the junior population. Such are the catches of an arithmetical kind. They are cosmopolitan and transparent; for example: 'A pack of wolves ran by; one was shot—how many remained?' 'If one man finds one kopeck, how much will three find there?' 'A peasant bought four scythes for four roubles; what will each come to?' 'There sat three cats, and each had two others opposite her; how many were there altogether?' The answers, I need hardly state, are, One, nothing, the ground, and three cats. Again: 'A flock of birds settled on a clump of trees: if they had perched in pairs, there would be one tree empty; if singly, there would be one tree too few—how many birds and how many trees?' A moment's consideration of this very elementary simultaneous equation will show that there are four birds and three trees. 'There was a party made up of a brother and sister, a man and his wife, and two brothers-in-law; how many were there in all?' Answer, three. Lastly, and to conclude a 'decrecendo' of bathos: 'Why does the dog bark and the cow lie down?' Because he can't talk, and she can't sit.

There only remains to add, that in Pskov and in other parts of Russia it is a peasant's custom not to allow the bridegroom to enter upon his honeymoon until he has answered correctly all the riddles propounded by the bride's companions. His lady-love would not be kept long in suspense, if the 'vivà-voce' examination involves no more baffling ordeal than that contained in the last few questions I have adduced.

TO THE SEA.

WHY art thou grieving evermore, O Sea?
Lo, through the long night-watches, I, awake,
Have heard thee cry. Hast thou a heart to break,
A human heart to suffer just as we?
What is the trouble that unceasingly
Maketh thy cry go up? Is it for sake
Of the dark secrets that the rivers take
From the great cities, bearing them to thee?
White faces thou hast rocked upon thy breast
With crooning song, like mother's lullaby;
And thou hast bound with sea-weed many a tress
Of hair most golden in its loveliness:
Ah, should it seem a marvel unto me
That thou shouldst grieve and grieve, and know not
rest?

MARY FURLONG.

** TO CONTRIBUTORS.

- 1st. All communications should be addressed to the Editor, 339 High Street, Edinburgh.
- 2d. For its return in case of ineligibility, postage-stamps should accompany every manuscript.
- 3d. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.
- 4th. Offerings of Verse should invariably be accompanied by a stamped and directed envelope.

ROUND ABOUT THE MENDIPS.

THE Mendip Hills, in the northern part of the county of Somerset, extend in a south-easterly direction from the coast of the Bristol Channel at Uphill to the neighbourhood of Frome, some twenty-five miles in length; at their widest part they are six or seven miles broad. The main range consists of an undulating plateau, 'highly diversified with elevated rounded swells and gentle hollows; its declivities are picturesque, and occasionally skirted with woods.' The hills attain their highest elevation in Blackdown, near Blagdon, and Beacon Hill, some two miles from Shepton Mallet, both of which are more than ten hundred feet above the sea. Large tracts of the Mendips anciently constituted a royal hunting forest; now, the plateau is very largely brought under cultivation, though there are still thousands of acres of open moor and common.

The sides of the Mendips are grooved with many combs, rugged in their grandeur, or exquisite in their beauty. Rickford Combe is of the latter description. The road winds at the bottom of the combe, between woods composed of beech, oak, fir, and larch, which clothe the sides of the valley, the foliage affording exquisite harmonies of rich colour both in spring and autumn. Burrington Combe is stern and wild; here cliffs of limestone abut on the road; and there the stony slopes of the hills shelve down, leaving only the width of the roadway between them at the bottom. But the most remarkable of all the Mendip combes is the pass or gorge at Cheddar. The road winds in serpentine form up the defile for two miles. At the lower end, on one side, rise precipitous cliffs to the height of four hundred and eighty feet from the road. They are almost perpendicular, and are castellated, as though the work of cyclopean builders. In places, the lines of their rugged beauty are softened by festoons of ivy and other creepers; while numerous daws build their nests in the inaccessible rifts, their shrill cries breaking upon the impressive silence of the pass. On

the other side of the road is a series of rugged bluffs of rock and hill. Gradually shallowing as it ascends, the ravine opens on to the Mendip plateau.

It is evident to the most casual observer that water must have been an active agent in the formation of these combes. They are winding, or zigzag, just as a stream naturally carves out its course. Burrington Combe is a fine example of the zigzag. Once between the sides of the defile, the traveller can see only from point to point. The serrated sides of the combe come so close together that he feels as though he were in the grip of a gigantic rat-trap.

The Mendips abound with subterranean streams, which gush out in springs at different points at their foot. These streams are supplied by the drainage of the extensive Mendip plateau. Sometimes the water collected on the hills plunges into a swallow-hole. This is the case at Priddy, where the waters of the river Axe go down a swallow-hole, and pursue their subterranean course for two miles, until they gush from the cavern at Wookey Hole. The subterranean course of this stream has been demonstrated by throwing chopped straw and colouring matter into the swallow-hole at Priddy, which emerged at Wookey Hole. A tributary of the Axe, which flows through Cheddar, after running some distance on the hills in the open, is lost underground, until, lower down the valley, it emerges again to the light of day. Cinders have been thrown up by the natural springs at Wells, which were made miles away on the Mendips. By some means they have got into the subterranean streams which supply the Wells springs. Similarly at Banwell, where a copious spring of excellent water rises, discoloration of the water has been noticed after a heavy downpour of rain on the Mendips, when none has fallen in the village itself.

These facts afford a clue to the formation of the combes. Rain falling upon the hills has soaked into the ground, and found its way through the numerous fissures and joints of the

limestone, till it has formed a stream underground. Gradually the stream enlarges its channel by the mechanical action of the water, the friction of the silt and gravel carried with it, and the chemical action of the carbonic acid which is held largely in solution, and which rapidly dissolves the carbonate of the limestone, until the roof of its subterranean channel is so worn away and weakened that at last it falls in. Frost and snow weather the sides of the open water-course, and thus, as the result of quiet waterwork, through innumerable ages, an open combe or hollow is made.

This process is now actually in operation at Wookey Hole. The valley in which the hamlet nestles insensibly narrows into a ravine, which is closed abruptly by a wall of rock two hundred feet high. At its base, the river Axe issues in full current. The ravine has been formed by the roof falling into the excavation made by the stream beneath. The rock which terminates it is undergoing denudation; and if the process continue long enough, the subterranean course of the Axe will be laid open to Priddy, and another combe will have been formed.

The Mendips are very rich in caves. Some of the stalactite caverns are among the most beautiful of their kind in the world, notably those at Cheddar. The Cheddar caves were accidentally discovered about fifty years ago. Half-a-dozen, or more, are united by apertures, and form a suite of underground apartments. Here, for ages past, nature has been at work, and her marvellous products, now exposed to the eye of man, excite wonder and astonishment in all beholders. The walls of these caves are in places covered with stalactite tapestry, the marble drapery of which hangs in folds, semi-transparent, rich in manifold colours and musical bells. Pendent stalactites hang like icicles from the roof, each tipped with a pellucid drop of water; while beneath, the stalagmite slowly grows from the congealing carbonate of lime held in solution by the falling drops. Here and there, a pool of clearest water, contained in a natural font, reflects the wonderful and fantastic creations of stalactite around.

Many other caves in the Mendips are most interesting to the archaeologist, such as the bone caverns at Hutton and Banwell; the hyena den at Wookey Hole, and Goatchurch and other caverns in Burrington Combe.

The most remarkable of the bone caves is that at Banwell. It consists of two large chambers: the upper contains thousands of bones of bison, horse, reindeer, &c., taken out of the red silt which originally filled it to the roof. This bone cavern is noticed by Dr Catcott in his treatise on the Deluge, published in 1761. The same writer describes the bones of the Hutton Cave as projecting from the sides, roof, and floor of the excavation in such quantities as to resemble the contents of a charnel-house. The immense quantities of animal remains these caves contained can best be realised by a visit to the Museum of the Somerset Archaeological Society at Taunton.

How were these vast numbers of bones deposited in the caves? Dr Buckland suggested—a suggestion endorsed by Professor Boyd Dawkins—that they were introduced from the surface by streams falling into swallow-holes, which have now, under the changed physical conditions,

ceased to flow. Animals not infrequently fall into swallow-holes and perish. Carnivorous beasts lurk for their prey at the places where they come to drink. The bones left by these means were carried by the stream at its ordinary height, or by floods, into the cavern. It is evident from the nearly perfect skulls of the bear and wolf which were discovered, that the cave was not used by the hyenas; for these animals are in the habit of cracking and splintering all but the most solid parts of the bones of their prey. Hyenas, however, are proved to have lived close by at the time, since their skulls and the gnawed antlers of reindeer have been found.

The most noteworthy of all the Mendip caves to the archaeologist is the hyena den at Wookey Hole, discovered in 1852, and explored in 1859 and subsequent years by Professor Boyd Dawkins and other savants.

In the exploration of the cave, evidence was found of the presence of prehistoric man. Implements of flint were discovered, and chert and bone arrow-heads, undoubtedly of human workmanship. As these flints were found under one of the old floors, it is evident that man was contemporary with the hyenas which frequented the cave and the animals on which they preyed. Many of the bones were gnawed and cracked into fine splinters, a proof that they had not been deposited by water, but left by the hyenas. The mere list of animals whose remains were found in this cave affords a vivid picture of the fauna inhabiting the Mendips at that remote age. There were bones of the hyena, cave-lion, cave-bear, wolf, fox, mammoth, rhinoceros, horse, urus, bison, Irish elk, and reindeer.

'All the facts taken together,' says Professor Dawkins, 'enable us to form a clear idea of the condition of things at the time the hyena den was inhabited. The hyenas were the normal occupants of the cave, and thither they brought their prey. We can realise these animals pursuing elephants and rhinoceroses along the slopes of the Mendips, till they scared them into the precipitous ravine, or watching until the strength of a disabled lion or bear ebbed away sufficiently to allow of its being overcome by their cowardly strength. Man appeared from time to time on the scene, a miserable savage, armed with bow and spear, not acquainted with metals, but defended from the cold by coats of skin. Sometimes he took possession of the den and drove out the hyenas; for it is impossible for both to have lived in the same cave at the same time. He kindled his fires at the entrance, to cook his food and to keep away the wild animals; then he went away, and the hyenas came to their old abode. While all this was taking place, there were floods from time to time, until eventually the cave was completely blocked up with their deposits.'

Goatchurch Cavern is the largest cave in the Mendips, and is situated in a ravine which opens into Burrington Combe. Its exploration was undertaken in 1864 by Professor Boyd Dawkins and others. The cave has several large chambers, which extend under the hill a considerable distance, and descend to a great depth. At the extremity, the explorer looks down upon a stream of water flowing underground. Another cave in this combe was opened in 1795, when from

forty to fifty human skeletons were found in a recess near the entrance, lying in regular order, their heads against the side of the cave, and their feet towards the centre. A later search discovered traces of charcoal, sheep-bones, flint knives, and a set of counters or dice, used by the Romans in games. Some have supposed it was a cave sepulchre.

Traces of prehistoric man are found not only in the caves but also on the hills. Numerous barrows are scattered in places, on Blackdown, at Priddy, and elsewhere. There are also several camps, which are alike in their general features, and are placed either on isolated hills, or on spurs which jut out from the main range with steep and almost inaccessible sides. These camps were evidently points of defence and observation. They overlooked the marshes, and commanded the ancient British paths, which have been traced in various directions.

The Romans have also left their traces on the Mendips. They occupied the camp on Beacon Hill, near which some of their roads intersect. The road to Old Sarum runs along the hills, and evidently descended to Axbridge, where there was a Roman station. The Romans worked the lead mines at Priddy and Charterhouse-on-Mendip, and appear to have carried the ore, via Axbridge, to the sea at Uphill, where they shipped it.

Fine panoramic views may be obtained from many a 'coign of vantage' on the hills. From Blackdown, the vale of Wrington is seen to great advantage, dotted with hamlets and homesteads, fertile and well wooded everywhere. Wrington itself is noted as the birthplace of John Locke, the philosopher, though the house in which he first saw the light is now demolished. Close to Wrington, peeping out from its woody knoll, Barley Wood may be seen, for many years the favourite residence of Hannah More. She and her four spinster sisters, varying in age from sixty-nine to eighty-eight, lie in a vault in Wrington Churchyard; and a tablet in the church perpetuates their memory.

North-west of Blackdown, at the end of a low range of hills which jut into the Bristol Channel, is Clevedon. Here Coleridge lived for some time, and the cottage in which he did most of his work is still shown. Clevedon Church contains the tomb of Hallam, the historian, and his son, whose memory is enshrined in 'In Memoriam.' The cold sea, bounded on the west by the hills of Glamorgan, still breaks on the pebbly shore, as described by Tennyson in his peerless lyric:

Break, break, break,
On thy cold gray stones, O sea!
And I would that my tongue could utter
The thoughts that arise in me.

If the spectator changes his position to some eminence on the southern side of the hills, he gets a wide extended prospect of the rich moors of Somerset, which extend for miles, bounded by the Quantocks and the Blackdowns in the west and south-west. At no distant geological period these moors were sea-covered plains; but gradually the hills were worn down by denudation; the earthy deposits kept back the sea, and the rich alluvial stretches of country were eventually brought under cultivation. From these grassy plains the far-famed Cheddar cheese is now produced.

Occupying a picturesque situation at the foot of the Mendips is the ancient city of Wells, taking its name from three springs, which rise in the grounds of the episcopal palace, and afford copious supplies of pure water. The first church was founded at Wells in 704 by Ina, king of the West Saxons; and the present cathedral was commenced about the year 1180. The cathedral is one of the finest and purest examples of Early English in existence. It has a magnificent west front, with niches for three hundred statues, representing kings, saints, angels, principalities, and powers, the whole being supposed to illustrate that grand old hymn of the Christian church, the 'Te Deum laudamus.' Internally, the noble proportions of the building strike the visitor. It is rich in monuments; and in the northern transept is the famous astronomical clock constructed in the fourteenth century by Peter Lightfoot, a monk of Glastonbury, and brought to Wells after the dissolution of the monastery.

Macaulay describes the miners pouring from 'Mendips' sunless caves' on the alarm occasioned by the Spanish Armada. But the Mendips do not figure largely in national history. Nevertheless, to the lovers of nature there is an indescribable charm about the hills, and the sequestered nooks of quiet beauty which abound in them.

THE BURDEN OF ISABEL.*

By J. MACLAREN CORDAN, Author of *Master of L. is Fate*;
A Soldier and a Gentleman; &c.

CHAPTER XXXIII.—'EVEN SO!'

ON the last night of the year, after dinner, Isabel sat with her Aged companion waiting. She sat with *The Sand-paper Review* in her lap, from which she had been reading a very grudging and supercilious criticism of Alan Ainsworth's play. A tall lamp was lighted, and diffused a soft, rich glow through its wide flounced shade of amber-coloured silk. Isabel was arrayed in a golden-tinted tea-gown of the material which ladies know as *crêpe*, and her abundant dark hair was arranged with a seductive negligence peculiarly her own. She wore no ornament but her beauty; her only jewels were her dark lustrous eyes. When she rose to go to the piano, the yielding material of her gown subtly suggested the lovely lines of her supple but superb figure; and her expression of meditative melancholy gave her more than a touch of imperial repose, which seemed to crown her with perfection. She had resolved to tell Alan that night of her engagement to her cousin George; and to soothe her mind and nerves, strung high with expectation, she now lighted the shaded candles, opened the piano, and sat down to play from Mendelssohn's 'Songs without Words.' From these she passed to the beautiful air which Mendelssohn wrote for Burns's exquisite song:

Oh, wert thou in the cauld blast
On yonder lea, on yonder lea,
My plaidie to the angry airt,
I'd shelter thee, I'd shelter thee!

* Copyright reserved in the United States of America.

She was thus occupied when Alan Ainsworth entered. She ceased at once, and rose to greet him, and the Aged companion discreetly slipped away. He looked much more festive than usual. He was attired in evening dress, which became his tall, lithe, broad-shouldered figure much better than it becomes most figures upon which it is seen: he had a white flower in his button-hole; his fair hair was somewhat rumpled; and there was a flush of excitement on his cheek, and a sparkle of excitement in his eye. When she saw him, she forgot all the pain and constraint of her last meeting with him.

'Why!' she exclaimed, 'you have shaved!' Yes; his moustache was gone; and there was revealed a strongly-curved lip, which suggested stern resolution and a something else which Isabel could not name.

'Yes,' laughed he freely; 'I have. I suppose it's the influence and the example of the men I've been mixing with lately.'

'Are you so easily influenced?' she said, still considering him.—'I don't like it!' she exclaimed, without thinking whether her liking or disliking it concerned Ainsworth.

'If you don't like it,' said he, 'I'll shave no more: I'll let it grow again. Shall I?'

Isabel felt that the air was becoming electrical, and she moved to the window to open it, saying: 'I think you had better.'

'Let me do that,' said he, following her. 'Though it will be an hour or two before the bells ring out the year.'

He opened the window, and stood by it with her. He looked at her; he had been looking at her since he had come in, but his look had been the only homage he paid to her appearance. Now, however, he spoke, saying: 'That is a very becoming gown you are wearing;' and he blushed when he had said it. 'I haven't seen it before.'

'Have you not?' said she, with a spice of mischief in her manner. 'Are you sure?'

'I am sure,' he answered. 'I know all the frocks and gowns I have ever seen you in, and all the frills and furbelows.'

That was a fuller answer than she had expected. But though disturbed, she was not displeased by it; and she began to perceive very plainly that it would be difficult to tell him of her engagement to Cousin George. Though the air still felt very electrical, she moved away from the window.

'Come and sit down,' said she, 'and tell me about your play. I have been reading what *The Sand-paper* critic has to say.' And she took up the paper and sat down; and Ainsworth sat down near her, with an evident consciousness of being near.

'Don't say "critic,"' said he; 'say "fault-finder."'

'I remember,' said Isabel with a smile, 'a certain critic in Lancashire, less than a year ago, who was a good deal troubled because his editor complained he was too much given to finding fault: he thought he was only a judicious critic.'

'Your thrust,' said he, with a laugh, 'is quite fair.'

'You told me in your note,' said she; 'but I don't quite understand why you suppressed your name; at least, I don't see that you had sufficient

reason for it, and especially for keeping the date of the production hid,' she added in a tone somewhat aggrieved.

'No; you don't understand that,' said he; 'but I could not put it all in the note I wrote you.'

He unrolled and rolled again the paper in his hands, and looked at her with an earnestness which made her at once fear what he might say, and yet long to hear it.

'When I began that play,' said he, looking at the paper, which he rolled and unrolled, 'months ago, I began it with a very definite object in view. I worked at it day after day and night after night with my eye on that object. Sometimes I should have liked very much to come and discuss it with you, but that did not suit my purpose: it had to be planned and written all by myself without suggestion or help from another. My immediate purpose was to make, if possible, a popular success.'

'Oh fie!' said Isabel, scarce knowing what she said. 'To seek a popular success is reckoned very unworthy—is it not?—and is very unfashionable among literary people!'

'I have no patience,' said Ainsworth very earnestly, 'with that shallow and absurd pretence! It is good and pleasant to know that very many, instead of very few, people like your work, if so be you do your work honestly. Why should it be thought less worthy to touch the hearts of the simple many than to tickle the heads of the knowing and cynical few? But it is not really so thought. It is all a pretence, made by some men to enable them to bear up against the disappointment of having their work received with indifference.'

'You think,' said Isabel, half consciously endeavouring to lengthen out his explanation, to postpone that end which alarmed while it fascinated her, 'that it is a case of "*Nolo episcopari*?" "I don't want to be a bishop: I wouldn't be a bishop if I could."'

'It is,' said he. 'I know men who are pining and fretting for a popular success, and who yet—or, perhaps, I should say "therefore"—are constantly sneering at what I heard one call the "humiliation" of popularity. Mind you, if a man sets himself to win popularity, and wins it by insincere work and false sentiment—and he does sometimes; for the big public is not well able to distinguish between the false and the true—then that man is to be denounced. I can honestly say,' he continued, 'that my work was not done insincerely. I set myself at the first to expound a subject that would appeal to many, and to express sentiments that would touch many, and then I wrote it all as sincerely and as well as I knew how.'

'I really believe you did, Mr Ainsworth,' said Isabel. 'I don't think you could be insincere. If you had written insincerely, I have no doubt you would have failed.'

'I *might* have failed!' said he, with the look of a man who has escaped a great peril. 'If I had failed—you would have heard of me no more! That was why I kept the thing from you!'

Again he looked at her earnestly and long. She returned his look, with something of dread in her eyes; and her breath began to come fast and thick, and her breast to heave under the soft folds

of her gown. Then he fell to rolling and unrolling the paper again.

'I think,' he continued in a low tone, 'that I would have failed—I was so despondent about it sometimes—I would have failed but that I had a great inducement and inspiration to go on.'

He paused; and she, in her dread of the pause, said lightly: 'What? The hope of fame and fortune?'

'Fame and fortune!' he exclaimed with a laugh. 'As for fortune—look here. I have just come from the treasury—the treasury of the theatre.' He took from his vest-pocket a folded paper, unfolded it, and handed it to her: it was a cheque for sixty pounds. 'That,' said he, with a sly touch of simple boyish glee, 'is for this week. I shall get a similar slip of paper every week. Is not that fortune?'

She was inclined to be offended, till she looked in his face and saw the boyish pleasure expressed on it; and then she understood that he had but impulsively set that before her, even as he would cast all his tribute at her feet.

'So,' said she, with a deliciously sharp sense of willfully misunderstanding him, 'you have now got all you worked for?'

'Worked for?' he exclaimed. 'What? That?—That is but the sign or token of the real, the intangible, end I had in view! Don't you understand? Haven't you seen that I felt bound to become as much of your equal as I could be? Have you not seen that?—Now, now,' he said softly, letting the paper drop and taking her hand impulsively, 'I come to you!'

'Oh,' said she, closing her eyes, 'I must not let you speak like that! It is wrong! It is wrong!' A shudder as of horror passed over her, while she grasped his hand convulsively.

'What have I done?' he said. 'Have I been a fool?'

'Oh no! It is not you! It is myself! It is myself! I should not have listened to you! But it was so sweet to hear you!'

'Isabel! Tell me!—tell me frankly! Do not shrink from telling me out of mistaken kindness! If it be that you do not love me—that you cannot!—'

'Oh yes,' she cried—and gave him one wild look—'I love you, my dear! I love you!—No, no!' she cried; for he had kissed her hand, and now sought to embrace her, to kiss her lips. 'You must not do that!' She rose hurriedly, and paced to and fro, and he rose too. 'I should have told you at once!—I have sinned against Heaven! I have sinned against the light! But I did not understand!—I have been living in a vague dream! I have been as if walking in sleep; but one word from you would have waked me! Oh, my dear, my dear! why—why did you not say that one word to me?' She threw herself sobbing on his breast for one brief moment, while he strained her close. Her wild emotion tended to produce in him an intense calm. He strove to see and to think clearly.

'Tell me—tell me,' he murmured. 'Is it that something has happened while you have been down in Lancashire?'

With one great sob she released herself to answer him. 'How foolish and vain a creature a woman is!' she exclaimed. 'I thought I understood! I thought I was wise! I thought I knew

perfectly what I was doing! But I did not.—Yes; it was in Lancashire!'

'Your cousin,' said Alan, 'said last Whitsuntide that he would ask you again in a year!'

'Yes, yes,' she answered; 'you remember: you heard him, and then I saw your look!—It was in the conservatory.'

'And he has asked you?—though it is not a year?'

'Yes, yes,' she answered again. 'I was asleep! I was blind!'

'Isabel! My own! my life!' said he, seizing her hands, 'you must give him up!—You are not married to him?' he cried in sudden alarm.

'No, no!' she exclaimed with a shudder. 'Oh no! Not that!—Not yet!'

'Then you must give him up—you must, my sweetheart!—my love! You must!'

'How can I? He is not to blame. And he is happy in my promise. How can I destroy his happiness?'

'And how can you destroy your own happiness?—and mine? To go on with him will be to commit the sin unpardonable! It will be nothing, and will breed nothing, but misery! If you should marry him——! Do you think that a husband will not quickly find out when his wife does not love him?—A loveless marriage! A loveless life! A loveless family!—Into a loveless family—children with the cold affections of fish!—discord comes, and envy, and dislike! So fools and worldlings marry, and so the earth is filled with strife!—If you had loved him, and not me, I would have gone away, and said no word!—But can I see you put your foot on this horrible way that leads to living death, and not try to hold you back by every means in my power?—I love you!—you love me, and I will not let you go! he said, as he drew her to him again, and she sank her head an instant on his breast. He kissed her hair.

'No, no, no!' she said, resuming possession of herself. 'This must not be, my dear.—I am losing myself!—I am forgetting! There is another thing that has troubled me—that has helped to lead me asleep—asleep and blind, my dear!—into this great sin!'

'What is that?'

She swept to the writing-table, unlocked it, took out Uncle Harry's Journal, and from its pocket drew the sheet of note-paper. 'You know this book!' said she. 'You have read some of it. It is Uncle Harry's last Journal.—Two or three weeks ago I found that in this pocket! Read it.'

He read it slowly—a first time, and a second; and then he looked at her. 'Your uncle says, "If you see your way;" did you see your way, my dear?'

'I thought I did!' said she. 'I was carried along fast—and blind!—I heard at that time that Uncle George might be ruined—by speculation!—I thought you were quite indifferent to me; and I resolved to give up everything—my money and myself both—to the family that had loved me and cared for me all my life long!'

'You were going to surrender both yourself and your wealth? Might not your wealth have been enough, my dear?'

'The money is not needed—there is no ruin threatening!—But the last time I saw you, you

were specially cold and reserved with me, and I could not endure it!

'I was wrong, I see,' said he; 'I have been wrong all through!—Proud, conceited fool I have been to imagine it was necessary to make myself your equal in wealth!'

'Your error is nothing to mine!' she said. 'But I did not understand, until it was done, what a horrible thing I was doing. I was asleep!—You had said no word to wake me!—And I believed that you were thinking we ought not even to be friends!'

'Oh, my Isabel!' cried he, taking her hands in his, 'how dear and sweet you become when I see you can make a mistake too!—and a big one!'

'This is more than a mistake,' said she, shaking her head.

'Now, my sweetheart!—my dear!' said he, 'I refuse to take this tragically! This—turning and fingering Uncle Harry's unfinished letter—has no right to influence your decision. Will you be guided by my advice?'

'Yes,' said she, with a touch of abandonment in her manner; 'advise me, my dear—advise me!'

'Give the money up!—as you had intended.—I also have heard suspicions of dangerous speculation on your cousin's side—I suppose that is what you mean—and the money may be needed soon. Then say to your cousin: "I have no fortune! We thought I had!—Let our engagement cease! We both made it under a mistake!"'

'No, no, Alan!' she cried. 'Surely, surely, that would be mean! You do not understand him!—You are not just to him!—I believe he loves me truly!—That's the pain of it—the pain of giving him pain!—To wrong him, and then to insult him!—That would be to insult him!—No, no! I cannot do that!'

'The pain of it is,' said he, 'that some one must be pained.'

'Then,' said she, 'I should be that person.—It is I who have done wrong!—I should suffer!—But then,' she added, with a thin appealing smile, 'you would suffer too, would you not?'

'So,' said he, 'out of your own mouth, my love, I can show you what you must do!—Which is better? That he should suffer pain for a little—from having lost a woman who did not love him—or that we both should suffer all our lives long?'

'Then,' said she, sitting down wearily, 'what about my dear uncle, and my aunt, and Phemy? I shall hurt and offend them.'

'Do you know,' said he, sitting down by her and speaking with decision, 'what I shall do?—I shall tell your cousin that you do not love him—that you cannot marry him! And then, my dear—then I will carry you off, whether you will or no!'

'Yes, yes! my dear, my dear!' she cried, resting her head against his shoulder. 'Take me away!—Make me go with you!—But, no, no!—That would look as if I ran away because I was afraid!—But help me! Decide for me, dear!—I thought I was strong, but I am not!—I have no decision—no will!—do not leave me to myself!'

'My sweet one, my dove!' he murmured, gently caressing her. "'Who comes to me as to her haven!'"—Shall I tell you what you must do

first? Get rid of that money!—I hate it!—It has come between us since ever it appeared!—Get rid of it!—Make your uncle take it!—One thing at a time. Will you try to do that, my sweet?'

'I will, my dear!'

'So let us say no more about it now. I will come in to-morrow—shall I?—to-night you should rest. Your nerves have been too much tried.'

'Do not go yet,' she murmured. 'It is not late. Stay with me a little!'

'I would stay for ever and ever, my dear!' said he. 'Would not a little music soothe you? What was that you were playing as I came in?'

'Oh yes!' said she, rising at once and going to the piano. 'It is beautiful. You shall sing it.'

So they sat down in tolerable calm. She played the air, and he—who was not a practised singer, but who was ready to do aught to please her—sang the song after a shy failure or two. The last quatrain he sang to her with point:

Or were I monarch o' the globe,
Wi' thee to reign, wi' thee to reign,
The brightest jewel in my crown
Wad be my queen, wad be my queen!

GEOLOGY IN PRACTICAL USE.

ONE of the most pressing problems at present before the country is that of technical education, and County Councils are everywhere striving for a practical solution of the same with the money placed at their disposal. Of the many branches of scientific knowledge which it may be decided upon to teach, none can claim to be of greater importance to the country generally than Geology. This seems obvious when we reflect that the wealth of the country depends primarily upon the earth itself—whether by the cultivation of its surface, or the extraction of minerals from it—and that geology is the science of the earth, and therefore lies at the root of both these pursuits. For the ability to deal profitably with any subject must ever be in proportion to our knowledge of the same, and with regard to our dealings with the earth such knowledge is geology. Hence, to a mining and agricultural nation, no scientific knowledge can be of more importance than this.

The value of such knowledge was clearly shown in the early days of the science, and by the labours of William Smith, the 'father of English geology.' Smith was eminently a practical man; his favourite theme was 'geology applied to practice'; and he showed how it may be used in solving the great problems of scientific agriculture, engineering, and mining. He came of a race who had for generations cultivated the oolitic lands of Southern England; and by applying his geological knowledge to the problem, he greatly improved their agricultural value. And it was by an improved system of drainage, founded on correct geological principles, that he was able to do this. His reputation for this sort of work led him out of Oxford into the surrounding counties, Gloucestershire, the Isle of Purbeck, Wiltshire, and elsewhere. An interesting example of the superiority of the geological method may be quoted. A Warwickshire farmer

had originated a system of drainage which had been successfully applied to a large class of lands. He had received a parliamentary grant of one thousand pounds for his invention, and a trial of the process was made by the Board of Agriculture. The place selected was Prisleigh Bog, and the experiment was a failure. Smith then came on the scene, and by an application of his more scientific method, easily accomplished the task.

As regards soils, again, geology is intimately connected with agriculture. For not only is the soil itself a geological formation, but its agricultural value is largely influenced by the rock below. Hence the farmer should not only be familiar with the geological formation of soils, but should also be sufficiently familiar with the rocks to know how they will influence his crops. As indicating this influence, it has been pointed out that many of the more noted cheeses—Stilton, Double Gloucester, Cheddar, &c.—are produced on the rich pastures of the lias; that the best malting barley is grown on the chalk; and that the best apple orchards are upon the red sandstone. The chalk pastures of the South Downs, again, are celebrated for their mutton; while the rich clay lands of Norfolk and Suffolk are more favourable for cattle-rearing and wheat-growing. And so a knowledge of geology may help a farmer to decide upon the most profitable crops.

When it comes to the question of renovating an impoverished soil a knowledge of geology is decidedly useful. If a soil rests on limestone, then a deficiency of calcareous matter may be remedied by deep subsoil ploughing; if on clay, chalk or marl must be sought for: in either case geological knowledge is wanted. A knowledge of geology may also indicate to a farmer the existence of building-stone, limestone for burning, road-metal, or deposits of phosphates on his own land, and thus save much expense in importing the same from a distance.

Not less clearly did Smith show the advantage of geological knowledge in engineering. During the six years he was engaged as engineer in the construction of the Somerset Coal Canal between Bath and the coal-field, he had ample opportunity of putting his gradually increasing geological knowledge to practical use. This canal is cut through the alternating strata of clay and oolitic limestone which characterise the district, and which offer peculiar difficulties to such undertakings. Smith was here able, as we read in his 'Memoirs,' daily to make use of his knowledge of the rocks by 'informing the contractors what would be the nature of the ground to be cut through, what parts of the canal would require unusual care to be kept water-tight, what was the most advantageous system of work.'

Again, the advantage of geological knowledge is noted in the following passage: 'In the execution of the canal, Mr Smith had found the means of applying his newly-acquired knowledge to useful practical problems, such as how to draw the line through a country full of porous rocks, so as best to retain the limited supplies of water which frequent mills left to the navigation—where to place bridges on a good foundation—how to intercept and conduct the springs, and where to open quarries of proper stone.'

By way of contrast may be mentioned the case

of another canal in the same district—the Kennet and Avon Canal—which, though the work of one of the ablest engineers of the day, was not constructed with that careful regard to the geological structure of the district as was the Coal Canal. As in the case of this latter, the nature of the rocks presented special difficulties. When cut through the clay beds, the water was easily retained; but when in the open porous limestone, unless carefully managed, the water would run through and disappear. And the numerous springs to which the alternation of the porous limestone and impervious clay give rise, unless found and properly managed, would burst through the canal wall and cause disastrous results. So bad became the state of this Kennet and Avon Canal, that in 1811 Smith was called in to report upon its state and suggest a remedy. And with the aid of his geological knowledge he was able to give the required advice.

We find again in the same 'Memoir' an interesting application of geological knowledge to a special problem connected with drainage. The year 1799 was an extraordinarily wet one, and owing to the geological structure of the neighbourhood, vast landslips occurred about Bath, carrying with them houses, trees, lawns, and fields. 'To remedy such disasters and prevent their recurrence was exactly what Smith had learned from geology, and had reduced to practice on many occasions while cutting the canal. Naturally, therefore, and as a matter of course, operations of this kind were placed under his care in the vicinity of Bath and Batheaston; and his reputation for success in draining on new principles rose daily.'

Another illustration of the application of geology to a water problem may be noted. In 1810 great consternation prevailed in Bath at the cessation of the warm spring on which the greatness of the city depends. Smith was sent for, and in a short time the water was flowing in its old channel.

But it is in connection with mining that geology attains its greatest practical importance, for mining is itself nothing more or less than the practical dealing with geological facts. And although the practical work of the 'father of English geology' was more in connection with agriculture and engineering than with mining, we may again quote an instructive example from his experience in connection with the latter. A certain property of seven hundred acres of poor land on the magnesian limestone of the county of Durham was reported as possessing no mineral wealth. Smith was called in to survey the estates of Colonel Braddyll, of which this formed a part. He was specially interested in this portion, which was thought to have nothing but a surface value; and by a survey of the neighbouring coal district he perceived that the magnesian limestone was merely an unconformable cover to the coal-measures. He estimated the thickness of this cover, and declared that coal would be found beneath it at a workable depth. In spite of the old Newcastle prejudice of 'No coal under the magnesian limestone,' Colonel Braddyll followed Smith's advice; and as a result the great South Hetton Colliery was established. Others followed; and now the more important seams of the great northern coal-field are worked beneath the mag-

nesian limestone in the county of Durham. This illustrates perhaps the most important function of geology in mining—the pointing out where coal may be expected at a workable depth.

One of the most interesting and important modern examples is afforded by the recent discovery of coal at Dover. As long ago as 1855 the question of the possible extension of the coal-measures beneath the newer rocks of the south-east of England was discussed by an able geologist, Mr Godwin-Austin. In a paper read before the Geological Society he expressed the opinion that the coal-fields of Bristol and Somerset were prolonged beneath the chalk and other rocks of the southern counties into the coal-fields of Northern France and Belgium. Certain striking points of resemblance between the coal-field of Somerset and that of Belgium, along with other geological considerations, led Mr Godwin-Austin to infer that these coal-fields were united by a ridge of carboniferous rocks passing under the younger rock of the south of England and Northern France. The practical question then was, 'Is there any point along this ridge where the coal is near enough the surface to be profitably worked?'

A few years ago it was determined to put the matter to the test, although a boring put down previously in the Wealden area to a depth of nineteen hundred feet without reaching coal did not offer much encouragement. The experiment was superintended by Professor Boyd Dawkins, and a boring was put down through the chalk of Shakespeare's Cliff, near Dover. And in 1890 the somewhat startling announcement of 'the discovery of coal at Dover' was made.

The spot for the trial seems to have been chosen with great geological insight, for it appears to be just where the younger rocks thin out rapidly against a bank of the older carboniferous strata, and coal was reached at a depth of eleven hundred and sixty feet. At the present moment, the number of seams met with is seven, with a total thickness of a little over fourteen feet. A shaft is also now being sunk, while the boring is continued.

It is, then, among the possibilities of the future that Kent, the garden of England, and hitherto far removed from the smoke of collieries, may become an important mining centre. And if this ever happens, it will be an example of the practical application of geological knowledge.

The probability of finding coal beneath the younger rocks in other areas is at present under discussion among geologists. There can be little doubt, for example, that coal-measures exist beneath the younger rocks on the south as well as on the north of the Mendip Hills. Yet they are at present only worked on the north. The reason is that on the south these younger rocks attain in places a thickness of three thousand feet, while on the north their thickness is often less than two hundred feet. Yet there may be portions of this southern area where the covering may be thin enough to admit of coal being profitably worked. It is a question of geological probability where such sites may be found. One well-known geologist, Mr H. B. Woodward, suggests the neighbourhood of Evercreech and Glastonbury; while another, Mr Ussher, suggests Highbridge, Burham, Wedmore, and other places,

where he thinks the thickness of the younger rocks will not be found to exceed one thousand feet.

Again, the possibility of coal existing at workable depths in the eastern counties has been suggested, and the more likely sites for boring indicated.

For the complete solution of these problems more geological knowledge is perhaps required, and they must be considered at present as merely under discussion. But if the geologist can, as the result of his special knowledge, often point out to the miner where coal may reasonably be expected, he has also often to warn him of those places where labour and money would be wasted in the search. Thus, as we learn from Professor J. Beete-Jukes in the Memoir of the South Staffordshire Coal-field, large sums of money had been from time to time spent in sinking for coal in the Silurian rocks of that district. A very little geological knowledge would have prevented such a waste of money and time.

In the old days, when geology was in its infancy, thousands of pounds were thus frequently thrown away; and many cases are known where the Kimmeridge clay, the Oxford clay, or the old red sandstone, have tempted the unlucky speculator to his pecuniary ruin. The labours of the Geological Survey have gathered together in their maps and Memoirs a mass of information of inestimable value to all engaged in practical dealings with the rocks. No mining engineer can afford to neglect its aid in working any district. But a certain amount of geological training is requisite before they can be profitably used, and hence, again, the need of geology in technical education.

Another plea for the instruction in geology of all those engaged in mining, &c., may be founded on the return benefit which would be reaped by the science. For it is those who are engaged in the actual working of the rocks, who, provided they have the requisite geological training, can best advance the science by the collection of new facts, and thus aid in the further development of those mineral resources to which England owes her present position among the nations.

ELSI E.

By JOHN STAFFORD.

IN FOUR CHAPTERS.—CHAP. I.

It is many years ago now, but it all came back to me to-day at the sound of an old tune which she used to play when loneliness sat hard upon her, and she would take up her fiddle and wander off into a spirit-world of her own making. She often went off so, making me think, as I watched her unawares, of Shelley's *Ianthe* when her spirit and its habitation parted company for a while. And when she would stop, and I knew she was all at Norton Priors again, I would walk away wonderingly, feeling, among other things, very coarse and humble beside such as she.

It was not always so, for, till she was fifteen or thereabouts, she had raised no thought in me beyond an admiration of her slim uprightness and her grace of movement, which always put

me in mind of the does in the Castle park, and pleased me, maybe, in the same way. But perhaps because I was slow to see it, or because I had known her from a child and taken her as part of the daily life of the place, I never felt the smallest tremor from her beauty, till one day when she ran into the shop all covered with dust from a fall that she had had, and held out her hand for me to draw from it the thorn that was paining her. Tenderly as might be I removed the thorn and bandaged with her handkerchief the little red place, like an adder's bite, which it had left; and I had no sooner done it than, child-like, she threw her arms round my neck and kissed me. I was a hulking lad of twenty then, and a bit sheepish over softness of that kind; but while she hung on to me that instant, and drew her head back before untying her arms, I saw that in her face which, when she was gone, went on vibrating within me, and playing such a tune among my heart-strings that I could get no sleep that night for listening to it, so to speak.

From that day I was never the same, and I hardly knew why. But, heedless-like, I let my thoughts go as they would, and Elsie was always their pivot. It was distracting at first, till I got used to it, and could work on in a dual way, thinking hard on the matter in hand, but knowing her presence within me and grateful for it. In this way she wound herself into the common life of each day, becoming a part of it—a golden thread among the homespun. And so it grew.

But she never dreamt it; and as she got older, and the Misses Gatten shaped her into quiet young-ladyhood, our mental and social differences moved her farther and farther from me, till I began to feel no better than a sort of thistle doing homage to a rose nodding far above me. All the same it was good to keep her where she was, and to go on day after day saying nothing of it. It was not a 'sweet sorrow' exactly, such as Shakespeare speaks of, though it became one in after-years, and is one now, maybe. So long as I could see her occasionally, and feel that she lived so near me, breathing the same air and sharing the same village life, I felt content; and, now and again, a quiet little hope would stir in me that by study and hard work I might raise myself nearer to her level. For, after all, I told myself, she was only a miller's daughter, and her widowed mother, whose father had been a major and one of the swells of Cheltenham, could not forget that she had married plain Dan Onslow out of love and nothing else. But it was like clay trying to shape its own vessel without the potter's hand. I was big and awkward, and the most I could do was to fill my emptiness with such knowledge as the few books and little leisure would let me. When my father died, however, and I came into the business, as well as a nice little sum at the bank, I felt a little less afraid of her; and when I put up the new sign which told the folks that I was 'George Crannock, Carpenter and Wheelwright,' I forgot my sorrow and loneliness in the pride of the moment, for I was twenty-four, and a master-man, and the thought puffed me up.

She was away at that time, I remember, staying with some relations at Gloucester; but I got to

know the day she was returning, and when the 'Nemoton Arms' bus passed through on its way to the station at Wonley I gazed after Tom Belson with a touch of envy that he should have the first sight of her. Tom, like Phaethon, was not an over-careful driver, and I could see him swaying in his seat as he turned the corner at the finger-post as if he had lost some of his ballast. I remembered then that it was market-day at Nemoton; but Tom had driven the bus for ten years or more, and I thought nothing more of it as I took up mallet and chisel for the spoke-hole I was making.

Three parts of an hour went by, and I found myself listening to the sound of wheels, though I knew the bus must be a couple of miles off at least. But the minutes went on till it really was due. Jem was sawing a thickish piece of ash, and I stood up and asked him if his buff Leghorn had hatched yet. His saw stopped midway, and I got a moment's stillness as he wiped his brow. He talked on for five minutes or more, then bent to his sawing again. I picked up the spoke, but threw it down, and moved to the door impatiently. Then a distant rumbling reached me, and I went in again, trying not to notice my own fluttering. But the wheels stopped in front of the door, and looking up, I saw it was only Farmer Waghorn in his gig.

'There be a job for thee at Two-mile Corner, Garge,' said he. 'Nemoton bus run agen Squire's cart an' lost near-wheel. No one hurt; but Parson thinks yo' can put wheel right if yo' go down. Him an' his son were in it, along wi' Miss Onslow. They're walkin' up, an' mebbe yo'll meet 'em.'

And meet them I did, coming quietly along by Arbury Wood. Mr St John, the new vicar, spoke first; and while he was telling what had happened, I looked at Elsie, and for a moment our eyes met. She flushed a bit and turned her head, for my glance had been too long, and I reddened myself at the thought of it. Her companion, Henry St John, without noticing me, motioned to go on; but she stood her ground, and when I turned to go, she came straight to me and looked up with her hand touching my arm.

'I am so sorry, Mr Crannock,' said she.

'But there's no harm done, Miss Onslow,' said the vicar. 'Crannock will get a stroke of work, and the bus a new driver, let us hope, after this.'

But I knew what she meant, with a sudden pinch of remorse; for I had thought as much of my own advance as of my father's death. I thanked her as well as I could, and seeing her hand extended, I took it in mine, and could feel the gloved fingers tighten ever so little with the sympathy that moved her. I forgot her fine-lady aspect and everything else, as I looked into her eyes and saw what was in them.

'God bless you, Elsie!'

She flashed another look of kindness, and went her way with the others. But I had seen Henry's brows arch at my impulsive familiarity with her name, and looking back, noted his bent attitude of attention as he walked beside her.

I wondered uneasily how much of the Long Vacation he would spend at Norton Priors. For it must have been he who had brought the happy

flush to her face by his Oxford talk and his well-favouredness. I walked on; but there was something gone from the sunlight, and the tool-bag seemed as heavy as two.

ON CERTAIN FLAVOURINGS.

ONE of the most curious investigations that could be carried out would be a consideration of the various food-substances, condiments, or flavourings and seasonings and food-adjuncts of different nations. Let us confine ourselves here to but one group of plants, which have a wide range of employment for food, from their pungent character—namely, those having allyl compounds, ranging from the onion through the crucifera and other plants with strong flavours.

All the members of this family are more or less esteemed for food and seasoning in different countries. Their strong smell and taste are due to a small quantity of a pungent volatile oil which they contain, rich in sulphur. The importance of the onion will be conceded by all, being wholesome and nutritious, and especially valuable for its antiscorbutic properties. All the plants of this alliaceous group agree in their stimulant and expectorant properties, differing only in degree of activity. The cruciferous plants are also characterised in most instances by their pungency, as in the radish, turnip, cresses, mustard, &c.; but these we cannot enlarge upon.

The onion is probably indigenous to India, whence it extended to China and Japan, and has spread to North Africa and Europe. Onions and garlic are amongst the most important articles of food of the Greeks and other natives of the Mediterranean coasts and the East. These bulbs are prepared in all possible fashions: boiled, baked in hot ashes, made into salad with oil and vinegar, or eaten raw. Both the onion and garlic are cultivated with great care in Greece; also in Malta, the exports from which amount to twenty-two thousand hundredweight in the year.

The ordinary onion, which grows wild in Turkestan, succeeds even in equatorial countries. It is much cultivated and used in the United Kingdom, to the extent of some forty thousand tons; and they are also largely imported from abroad, the imports having doubled in the last ten years, and reached over four million bushels in 1891, valued at about seven hundred and thirty thousand pounds. They are brought in chiefly from Germany and Holland, Portugal and Spain, Turkey and Egypt. Spain takes the lead with a value of £170,735 in 1891; next comes Egypt, £165,825; and then Germany, £106,885. Those grown in the Peninsula are larger and milder than the English ones. The onion is one of the staple products of Bermuda, and those grown there are chiefly shipped to the United States.

The onion and the garlic are extensively cultivated all over India. The onions of Patna and

Bombay are of a very high quality, and are now exported to Australia. It is surprising how powerfully the climate of India seems to affect the onion. In one province excellent onions are to be had, while in another they are very inferior. The cibol or Welsh onion is met with in Central Asia. The onion was one of the principal culture-plants of ancient Egypt. Mohammed never would eat these strong-flavoured bulbs, on account of his assumed converse with the angels. But he allowed his followers to do so, except when appearing in his presence, entering a mosque, or joining in public prayers. The pious Moslem still eats his onions with these limitations. Some sects, however, as the Wahabis, considering them abominable, avoid them on all occasions—they are forbidden because of some supposed relation to beef.

The bulbs of garlic are extensively grown in Turkestan, and used in Lassa. In Yarkand, however, the people do not seem to care about the plant; but they use, according to Dr Aitchison, large quantities of a wild onion, which they collect during the summer, smashing up the whole plant between two stones in a thick green pulp; this they make into patties, which they string together by a hole in the centre, like so many beads, and then hang them up to dry. The country people may be seen on market days bringing into Leh strings of these onion patties for sale. They keep well during winter, and make an excellent condiment. In Spain and Portugal the onion forms one of the common and universal supports of life. It is not merely as a relish that the wayfaring Spaniard eats his onion with his humble crust of bread as he sits by the refreshing spring, for he finds that, like cheese to the English labourer, it sustains his strength, from the amount of flesh-formers and heat-givers which it contains, ranking in this respect with the nutritious pulse and grains.

In North America, the onion not only enters largely into consumption, but is a considerable article of export; 80,275 bushels were shipped from thence in 1890, valued at £12,550. The onion is not likely to become a drug, from the fact that it cannot be easily raised as a winter-keeping vegetable in southern latitudes. The bulb is much inclined to sprout or grow after being harvested, and the condition of success in keeping them is said to be a low dry temperature without frost. Onions and garlic are extensively grown in the south of France, the latter especially on a large scale on the sandy borders of Durance.

The delicate kind of onion called popularly shallot or eschalot is stated to have been brought to Western Europe by the crusaders, who named it after Ascalon, in Palestine, where they found it; but the specific name had already been used by Theophrastus and Pliny. Having a stronger taste than the onion, yet not leaving the strong odour on the palate which that species of allium is accustomed to do, the shallot is often preferred and employed instead, both for eating in its natural state and seasoning. The garlic of Ascalon is an indispensable condiment in modern cookery as a seasoning, and also used in pickles, salads, and to flavour vinegar. The species known as chives is a native of Britain, and available

for salads and condiments. They form a favourite addition to soups in Scotland. Chives are grown in Europe, North America, and Northern Asia, and cultivated as far north as latitude 70° 22'.

The British leek is common in Middle and Southern Europe and Western Asia and Northern Africa. It is called in culture the summer leek, a variety of which is the pearl leek. The whole plant is eaten, being employed in soups, &c., and is by some persons boiled and eaten with meat. Leeks are much more used now than they were at one time.

Garlic is used both in hot and temperate climates. It was cultivated in ancient Egypt. Garlic is eaten to a much greater extent than the onion by the natives of India and Spain, the aggregated white bulb or cloves being offered for sale in every bazaar. A considerable demand has lately sprung up here for garlic oil and garlic vinegar for sauces, pickles, and seasoning. Garlic was formerly held in great repute in medicine, but is seldom employed now in England, although so used in the United States. The cloves of garlic steeped in rum form a favourite remedy among country-people for the whooping-cough, the infusion being rubbed into the skin of the patient's loins. A clove of garlic or a few drops of the juice introduced into the ear are also believed to be highly efficacious in atonic deafness. The tops of the bulbs of *Allium canadense*, of eastern North America, are much sought for to give pickles a superior flavour.

Rocambole, the sand-leek, the Spanish garlic of Europe and North Africa, resembles in some respects garlic, in others, shallot.

The bulbs of *A. Leptophyllum* are eaten by the hill-tribes of India, and the leaves are dried and preserved as a condiment. According to Deslongchamps, the Institutes of Menu prohibit the higher castes from eating the onion, the garlic, and the leek. These three plants are, however, generally cultivated in India at the present day; and the leek, it may be observed, bears the Egyptian name 'khorat.' A Greek word used by Homer is considered to have reference to the leek; and Pliny expressly mentions the presence of this plant in Egypt, where at the present day it is commonly cultivated. The tree onion and the wild garlic of Kamchatka are other species of the *Allium* family.

Among the ancients, condiments to stimulate the sluggish appetite seemed to be in chief demand. Amongst these, *asafetida*—which is to-day highly relished in Persia and the East—was an indispensable ingredient; and it is even now used moderately by cooks in Europe, to give flavours to some meats and dishes. A few words on these alliaceous gum resins of Asia may be interesting.

The gum resinous exudation known as *asafetida*, obtained in Persia from several species of *Ferula*, is largely consumed there and in India. It has a nauseous alliaceous smell, but loses some of its odour and strength by keeping. It is locally known as *Anguzi*; and in India the pure drug is called *Hing*, and the coarser kind *Hingra*. India seems to be the principal consumer, as the imports there range from seven to nine thousand hundredweight annually. It is much used by the Hindus as a flavouring for food, being a

favourite ingredient in their curries, sauce for pillaus, &c., on account of its stimulant stomachic properties. The Turkomans are very fond of the young shoots dipped in vinegar. Its uses in Persia are very numerous, especially as a medicine. There are people there who are so accustomed to its use for nervous complaints, that it is like opium to the opium-eaters, one of the necessities of life. Its excellent anti-spasmodic qualities are too little known and appreciated in Europe.

The liquid form of *asafetida* has from the remotest times been held in great estimation by Eastern doctors, and was once regarded as worth its weight in silver. It is highly esteemed as a carminative and condiment, also as an anti-spasmodic. If taken daily it is said to prevent the attacks of malarious fever.

Galbanum is a product of Syria and Khorasan. Liquid Persian galbanum is derived from an undescribed species of *Ferula*; several of this genus of plants furnish gum resins of an alliaceous odour. Certain others yield the exudation known as *sagapenum*. It is met with in the form of yellow-brown or reddish agglutinated grains, of garlic odour, intermediate between *asafetida* and galbanum, and of acrid bitter taste, softening with the warmth of the hand. When heated, it evolves a peculiar smell, partaking of garlic and juniper, which is neither so powerful nor so disagreeable as that of the fetid gum.

THE GOLDEN BRICKS.

By CHARLES EDWARDS.

'Now, boys, let's push this thing through. I've a deal better work on my hands before the sun goes down.'

And the auctioneer went on with a few stereotyped jests, at which he himself laughed, as also did the majority of the men who were lolling within easy sound of his voice.

But there was one man who did not laugh. Crank Partick was old and bent, and he wore his gray hair and beard like a veteran who has long lost his interest in life, and has no women-folk about him mindful of his exterior presentment. Crank Partick had edged his way to the auctioneer's feet. There he sat on the ground with a look in his bleared old eyes like that of a dog with a bad master, from whom one caress may, however, atone for fifty kicks. He took no notice of any one except the auctioneer.

With Partick was another man, some thirty years his junior. This was Steve Brown, his son-in-law. Steve, who seemed much entertained by his father-in-law's appearance, smoked a short black pipe, and winked at the other boys off and on, nodding in a half-compassionate manner towards old Partick.

A stout person with a hooked nose found this little group so interesting that he edged up to Steve and whispered: 'What's the game, Steve?'

Steve merely hitched his shoulders as, with a smile in the corner of his mouth, he replied, against the back of his hairy brown hand: 'Oh,

just a bit of a craze in the old un, nothing more, as I know of. There never was such an old fool.'

This seemed to satisfy the hook-nosed man, though he paid profound attention to Crank Partick, even when he had withdrawn and set his shoulder-blades against the tumble-down bit of wall that supported most of the other bystanders.

'Now, then,' resumed the auctioneer, 'you all know the biz. There it is; look at it, and stump up your offers. Make your offers, gentlemen, and a tall drink for the one that begins with any decency.' He pointed as he spoke to the red house behind him.

It was not much of a house, just a two-storeyed red brick building, with five windows in front, no glass in its windows, a broken chimney, and the words 'President Villa' impudently staring at the small crowd from a stone cross-piece over the door. The bricks showed unmistakable signs of crumbling. The house had clearly served its turn.

'Gentlemen, gentlemen'—the auctioneer was beginning again, when old Partick wrenched out a cry of, 'A hundred dollars!'

'Thank you, Mr Partick,' was the ironical reply. 'One hundred dollars! There's a drink booked for Mr Partick at the Beggar on Horseback.—You may just as well know, all of you, that it's only the bricks and fittings that are going. Guess you thought the land was with it when you made your offer—eh, Mr Partick?'

Crank Partick did not move a muscle. His parchment-face was upturned towards the auctioneer, and the renewed laughter of the boys was nothing to him.

'One hundred dollars for building material of the very first water!' cried the auctioneer derisively. 'Gentlemen, what on airth are you dreaming about? This is one of the oldest edifices in the township. You'll not match these bricks in a hurry. It's a house with a history, I'm told—and all for a hundred dollars.'

'I'll rise twenty-five,' observed the hook-nosed man. 'I fancy them bricks—good colour, you know.'

'One hundred and twenty-five dollars bid!' exclaimed the auctioneer.

'Fifty!' said Partick.

'One hundred and fifty! Tell you what, gentlemen, you'd do well, any one of you, to buy this house and retail its bricks as keepsakes. Or, better still, pack it all slick off to Chicago for the show. There'd be no worrying around with it there. There's a thousand millionaires who'd jump at it for their garden-plots and all that. Talk about your Ann Hathaway's cottages from England! This beats it hollow. One hundred and fifty dollars offered by Mr Partick.'

'Didn't know you were worth all that—the lot of you, Steve!' whispered the vendor in an aside to Crank Partick's son-in-law.

'Nor me,' was the rejoinder. 'He's off his nut, but I can't help it.'

'Another twenty-five!' said the hook-nosed man.

'That's two hundred dollars, less twenty-five!' said the auctioneer.

'Two hundred, sir,' sighed Crank Partick. This time, at any rate, the old fellow showed some emotion. There was a flavour of ripe human despair in his voice.

'Two hundred!' cried the auctioneer. 'Ah, gentlemen, make room there for Mr Bex, the famous photographer. Didn't I tell you I was offering you a rare good thing, and only two hundred dollars offered!—Come along, Mr Bex—you've come to make a picture of this most remarkable building, haven't you?'

Mr Bex the photographer nodded, and, the sun being favourable, straightway fixed his camera.

'Old place, sir, ain't it?' continued the auctioneer.

'Well, for this part of the world, it *is* old,' the photographer admitted. 'There's been some famous paper signed in that house; there wasn't much township when it was raised. I guess there's enough interest in it in the State to pay me my trouble.'

'That's so,' ejaculated the auctioneer.—'Hear him, gentlemen! Mr Bex ain't the man to delude you. He's a business man, like the best of us.—Now, I ask you straight, where's *my* profit on this morning's work if I let the whole house go to Mr Partick for a couple of hundred dollars?—What did you say, Mr Partick?'

'I said as there was the work of pulling it to pieces, I did,' was the weak, tremulous reply from the old man.

'And twenty-five,' said the hook-nosed man promptly. Mr Partick's evident terrible earnestness impressed him.

Crank Partick began to shake violently. He muttered to himself, and the auctioneer saw red agonised streaks in his yellowish eyeballs as he rolled them in his sockets.

'Reckon that'll stop you,' observed Steve, thrusting his little finger into his pipe-bowl in a nonchalant manner.

'Two twenty-five—any more, gentlemen?—any more, I say? Once, twice'—

'Two fifty,' screamed Crank Partick, with foam about his lips.

The auctioneer seemed amazed; so did the bystanders. But the former instantly recovered himself, and looked towards the hook-nosed rival—to behold him fall suddenly on his face.

The sale was suspended while they crowded round to ascertain what had come to Solly Moss. They turned him over, and tried to put him on his legs again. But it was no good. Solly Moss's heart had given out, with not a moment's warning. When this was understood, six of the boys carried him off to his wife, commenting over his body between their gasps upon the strangeness of the occurrence.

It was a sight to see Crank Partick's face while this was happening. The old man's eyes had dilated, and an expression of brutal triumph sat therein and upon his thin worn lips.

Mr Bex the photographer soonest recovered self-possession. Having taken the house, he took the death-group with professional celerity and

unobtrusiveness; and then he took Mr Partick's face, the like of which he had never yet seen.

So five minutes passed. Then the auctioneer returned to his duties. 'Gentlemen,' he said, 'this is a most extraordinary and unparalleled occurrence. I've seen a good deal of the world, but I've never before had a bidder drop off like that. But, as the Bible tells us, all flesh is grass: we're here to-day, and gone to-morrow; and so we must make the most of the flying moments while they're on the wing.—Any rise on Mr Partick's two hundred and fifty dollars for the bricks?'

'Two hundred, I said!' protested old Partick, writhing as if he had been pinched.

The auctioneer pursed his lip. 'I guess that's a lie, sir,' he said solemnly. 'Think of what's just happened, sir, and remember Ananias and the lady in the Acts of the Apostles. I've two hundred and fifty offered by Mr Partick. Any rise—once, twice—twice—thrice!—There, it's yours; and I'll trouble you for settlement right away.'

The auctioneer had to accompany Crank Partick to his bit of a shanty hard by. Here, to Steve Brown's surprise, the old fellow went to a board in the floor and took from beneath it greenbacks and silver for the requisite amount.

'How much more have you got, dad, under there?' Steve inquired, when the auctioneer had gone.

'There was only three hundred altogether, Steve darling,' was the old fellow's excited reply. 'I'd have died, I would, if that other one hadn't dropped off. There's glad times coming for us, Steve. I'll tell you all about it to-night, every word.'

'Well, I'm a bit bothered,' said Steve, as he went off to digest this purchase with more tobacco, and also to find out what had killed Solly Moss.

'Shut the door, Steve,' said old Partick, 'and jam things agin it. There ain't no room in what I've got to say for any besides you to hear it.'

'My sakes, what's a-coming?' laughed Steve Brown. 'They say Solly's got his billet through the visitation o' God, whatever that may mean. No larks, dad: you ain't going to turn wild and fix me up for the boys to say the same of, eh?'

'I've been waiting for this day five-and-thirty years, and it's come. Run that there bed agin the door and put the bottle near, and then I'll tell you about it.'

'Grave serious, dad?'

'You'll say that this time a week, my son, when we've split up them bricks, you and me, and never another in the world, mind that.'

'Sounds lively. Well, I'll just humour you, boss. Guess I ought to be a match for you if you begin to rave.'

So saying, Steve Brown ran the bed to the door of their bit of a cottage and pressed it tight. Then he shook the lamp, as if to menace the oil with something worse than burning if it refused to do its duty to the best of its ability; fetched the whisky bottle and banged it upon the rough table by old Partick's chair. 'Liquor up, dad, and reel out,' he exclaimed genially.

The old man poured himself a dose of the spirit, and with trembling hands tossed it down his throat. 'Eh, but that's fine!' he muttered;

'Oh, it's that way, is it?' said Steve sharply. 'I'm all ears, then.'

After a brief spell of gasping and lip-licking—for the whisky was fiery as well as palatable—Crank Partick plunged into his story:

'There was me and a pal, name of Johnson, that worked together at them diggings up Sacramento way when fust they was talked about. I can't exactly remember what year it was, but it was a dreadful lot of Christmases ago. I mind the Christmases because it was Christmas week as that cursed cow of a Marshal took the bricks from us to build that there house. He didn't take them from Johnson neither, because Johnson had turned up his toes the day before. If it hadn't ha' been for that, we'd ha' fought for them, Johnson and me, City Marshal or no City Marshal, and abode by the consequences.'

'I tell you, Steve, lad, we didn't do bad at all, Johnson and me. We was there among them rivers and rocks, and as wild a crew of fellers as ever I see, for two months just. I was to marry Jane if I did pretty well. She were your wife's mother, after all, for she were a stickfast sort of a one; and once her heart was given, it warn't took back. But, good sakes, lad, what a difference it made me, marrying her! Wimmen, Steve, wants to be kept under. I pined foolish, and didn't let on as what the matter was; and the consequence was she stuck her spurs into me right and left long as she lived. Nance, our girl, would ha' been just the same if her fust baby hadn't done for her. There's comfort in them kind o' thoughts, Steve, and so I tell yer.'

'Not much,' observed Steve, who had been very fond of his young wife.—'But drive on. I like your tale, dad, a deal better than your sentiments. You can ent them, if you like, and steer straight for the bricks.'

'I'll try, Steve,' was the reply, 'for you were a good husband to Nance, you were that.—It was this way, then. Johnson and me had got about as much gold as we could stick on our backs and do a day's tramp with without screeching. And so I says to Johnson, "Let's go off with what we've got;" and he says, "Right you are."

'There were sixty pounds of it between us. How lovely it was to daunder it through our fingers all a trickling like yellow water with the sun on it! Sixty pounds, Steve, only think!'

'Great Jupiter!' ejaculated Steve.

'But,' resumed Crank Partick, 'they were mighty bad times there then, and we warn't over-much sure of getting through with our pile. Still, try it, we meant; and try it we did.'

'I can't kinder remember how many days we footed it; but we come by-in-by to the funniest thing you ever see in a place where there warn't no town nor nothing. It was a pit of red clay with a bit of a kiln, and two carts, and just three men working it. We stopped the night and talked with them, and they told us how a chap was going to raise a town not five miles off, and he'd bought up all the bricks as they could turn out. "All?" said Johnson. "Couldn't my pal and me have one cartload to our own use?" I didn't take him at fust; but when he cranked at me, I knew something was in the

wind, and I backed him. The men thought we were crazy; but all the same we bought horse and cart and a good load of them red bricks for a matter of five pounds of dust. It warn't cheap: it were dear; but them was times as you couldn't pick an' choose in.

'That night, what must Johnson and me do when the others were asleep, but melt our ounces into hot lumps of gold, and cut 'em into bricks of, I guess, nigh on three pounds each. Then we got clay—there was lots of it about—and dumped it round the gold; and so in the end there were one-and-twenty bricks which had our fortunes in their bellies, and which we meant to get baked and take along with us. Reckon you begin to see now what's coming?'

'Reckon I do,' gasped Steve. 'Go on, dad.'

'Well, we got off, Johnson and me, and made up to fetch a round route away from the blistering new township they'd told us of. It was that as wrecked us. Johnson were took ill and died, and I buried him, and knew that it made me twice the man I was before. And I were that impatient, I pushed on and on, and dreamed a heap of fine dreams about what I'd do *when* the gold was all in bank.

'But it was in the middle of them dreams that one day up druv the Marshal and collared the horse and cart and bricks. "Where's your pal?" he asked; and when I told him, he said that yarn wouldn't wash, and that I'd done away with him for the gold we'd got between us. You see, Steve, what a fix he put me in. I swore as we'd got no more gold; and he searched me, and said it was lucky he found none, or I'd ha' been strung up—and he were the man to do it. And he pinched the bricks, and said they were his; and if I didn't disappear, it would be all up with me.—Steve, I can't think of it without trembling; it seems to me that my best manhood went out of me after that day.'

'And those scrumptious bricks are in the house we've bought to-day?' cried Steve, heedless of the pathos in his father-in-law's story.

'They are. I sneaked in after them, and lay hid till I'd seen them made into walls. Then I took my hook, swearing I'd never rest till I'd got my own agin.'

'And Johnson's too, dad. The drinks and square meals we'll have when we've laid the thing flat!—But let's hear it all while we're about it.'

'I guess there ain't much more to tell. That dog of a Marshal lived fifteen years after building the house, living in it all the time. When he was dead, I crep back to the township, and here we've been ever since. I've never took eyes off it, and I've scraped and saved to buy it, let alone hammering and scratching at every brick as I could reach when I could do it without being seen. I thought the day would never come; but come it has at last!' Old Partick helped himself to more whisky.

'By Jove!' exclaimed Steve, 'I'll believe it all, dad. It would have been pizen for you if Solly Moss had filched it off us.'

It was as Crank Partick had said. But the gold was not found on the first day of the search for it; nor the second; nor the seventh.

The dead-heads of the township thought their

work in the gutted interior of the old house a great joke, and did not keep their opinion to themselves. The interest they showed in the business maddened Partick. He would fain have had a ten-foot wall built round his newly-acquired property. But Steve's saner mind tackled the problem more effectually.

'The old un,' said that discreet young man to the idlers, 'is head downwards. He thinks we've a fortune to make out of split bricks, and so split 'em—every mother's son—we mean to. There *is* some of a market for 'em; but I reckon we'll do well 'if we see our money back. Besides, the boss who owns the land, he wants it cleared mighty quick. That's what it comes to—see!'

Those of them who *saw* were vastly entertained. The others smoked and chaffed, and when they grew tired of watching the two men picking at the bricks—and breaking one about once in a minute—slouched off to more congenial fields of idleness.

But you should have seen the frenzied way in which the two men worked when they had the place to themselves. It was the heart of the summer-time, and they watered the dry soil and dust about them with the sweat of their brows. The toil told on Crank Partick. After the first day he was woefully exhausted. On the third evening he was evidently nearly worn out.

'You'd better knock off and leave it all to me, dad,' said Steve.

But this did not satisfy Crank Partick. 'I'll do it, lad,' he stammered—'I'll do it on liquor; that'll hold me up.'

'I ain't so sure about that,' objected Steve—quite to no purpose, however, for his father-in-law soaked whisky into himself every evening.

It was wonderful with what a spurt of renewed energy old Partick began each of the succeeding days. For an hour or more he put Steve in the shade as a destructive mason. Then the vigour would rapidly weaken in him, and by noon he was incapable of doing aught but on a heap of the rubble using his pick mechanically. Even then, however, his eyes were aglow. They missed none of Steve's movements, and burned in hatred at any visitors who lounged into the precincts.

On the sixth day, thanks mainly to Steve's abounding pertinacity, they had reduced the villa so that it was merely a shell some eight feet high. The aid of an expert had been requisitioned to batter the walls. *Their* work was to split the bricks merely, and cast the débris outside.

The seventh day found Crank Partick unable to do aught but swallow whisky.

'You just stick to your bed, boss,' said Steve, 'and leave it all to me. I ain't a-going to steal a run on you, so don't think it. I ain't so dead sure you've remembered the history of that there gold right; but I'll go through with it now and chance it; and soon as I strike anything good, I'll bring you word.'

But this did not please the old man. He had therefore to be led tottering into the house and set where he could still overlook Steve's exertions.

A fortnight went by. There was now nothing but a parapet of red bricks waist high environing them. Crank Partick's mind seemed quite unninged by excitement, and a grim terror lest

somehow he had been overreached, after all. He would sit in a heap all day, groaning and glowering.

'Dad,' said Steve at last, 'I've lost a'most more flesh over this biz than I had to start with. I'm ready to knock under.'

'Knock under! Oh, you fool, Steve! It's there; it must be there! I seen 'em *all* laid with these very eyes—*all*, I tell you, and the gold uns was with 'em. They'll be at the bottom.—Oh, sweet heaven over us, don't you let me jine Johnson till I've had it between these fingers!'

Steve shrugged his shoulders and again grasped the moist-handled pick. 'Perhaps you're right—I dunno. Anyway, I won't say die yet.'

'And Steve, dear, it'll all be yours—remember that, for I'm a bit shaken more than I'll bear, and I shan't live long.'

And again the clink, clink of the iron sounded in the enclosure. The echo in the place was very feeble now. There was next to no wall to trifle with the sound.

The old man was prostrate the next day—speechless and limp, with positive signs of approaching death upon him. Steve fetched a doctor, who did but confirm the evidence of the parents visible even to unprofessional eyes.

'He may splutter a bit, and then he'll drop off,' said the medical man. 'I'm no use.'

'Dad,' cried Steve in the dulled ears of the dying man, 'I'm going to stop with you to-day—you're above a bit off colour.'

For five or six moments there was no coherent response to these words. Crank Partick was struggling to say something, but nothing would come. Then, however, he half rose with a jerk and hurled the one word 'Go!' at his son-in-law, dropping back afterwards with a thud.

'Pretty' murmured Steve; but he went, having arranged with a woman-neighbour to look in upon the sick man every half-hour.

It was nearly one o'clock this day when Steve came upon the first of the twenty-one bricks. The 'clink' was different from that of the rest, and at the blow the thing broke into scales, beneath which there was a yellow gleam that made the young man's heart leap. Another knock, and the cake of gold was disclosed. He shook it clear of the dust and spikes of baked clay, and ran with it under his jacket to his father-in-law.

'Look here, dad!' he cried, flourishing the gold above the pillow—'look here, I say—it's all right. If there's one, there's bound to be more.'

Crank Partick was at the last gasp. He opened his eyes wearily, and the shrunken lids closed over them again.

'It's the gold, dad—it's found,' whispered Steve in the old man's ear.

The words reached him now. His lips slowly parted. 'I told you so!' the lips said, faintly as the rustle of trees far, far away. The right hand moved feebly, with a widening of the fingers; and Steve, rightly understanding the sign, put the gold brick into the palm. The fingers gripped it tenaciously for an instant, then it fell on the ground, and, with a gasp, Crank Partick died—a smile of strange triumph on his face.

Steve recovered the gold from all the bricks;

it made weight enough to bring him twelve thousand dollars. The township people wondered why he gave his old idiot of a father-in-law so expensive an interment.

CATCHING A TARTAR.

A YEAR or two ago the 'Standard' contained an account sent by its Berlin correspondent—of a fight between a hare and an eagle owl, which had an unexpected termination. The owl, it appears, attacked the hare with the intention of making a meal off it, but met with a resistance for which it had not bargained. In the end the hare became the victor, escaping apparently unhurt, and left its formidable antagonist tumbling about on the ground with a broken wing.

Such turning of tables by the weak on the strong, when the strong is the aggressor, is by no means unprecedented in the records of the animal world. At the same time, any one who is acquainted with the eagle owl—and what visitor to the London Zoological Gardens is not?—will have a high opinion of the courage—although it was the courage of despair—shown by poor puss on this occasion. The eagle owl is an alarming-looking bird at the best of times; but when he is angry or excited, his appearance is truly fiendish. At such times his feathers stand out on end all round him; his eyes burn like live coals; and how he hisses! Until one has heard him, one can form no idea how expressive of hatred and contempt a mere hiss can be made. The hiss gradually increases in volume until the culminating point is reached, and then the owl projects itself violently against the wire of the aviary, and the startled visitor beats a hasty and undignified retreat. Such at least are the manners and customs of the eagle owl in other places of confinement. In the London Zoological Gardens these birds have grown so accustomed to being stared at, that they seem to think it scarcely worth while to indulge in any display of animosity. They take refuge in sulky, silent dignity.

The hare certainly showed her mettle in this case; but then, she is not altogether so timid as we commonly imagine her to be. She readily flies from man indeed, except during the month of March, when her proverbial 'madness' is upon her, and when she shows a curious deliberateness in all her movements utterly at variance with her usual habits. But she has been known to stand up boldly against attacks made upon her, or more especially her offspring. Bishop Stanley gives an account of such an event. A small hawk, probably a kestrel, was seen to be carrying an animal of some kind in its talons; while on the ground immediately below, a hare was observed keeping up with the hawk. The bird being evidently over-weighted, was unable to rise, and flew close to the ground, sometimes almost sinking to the earth; and each time it came within reach of the hare, she struck it with her paws. At length

this persecution proved too much for the hawk, which relinquished its prey and soared off into space and peace. It was found that the hawk's quarry was a young leveret, which its parent thus rescued from death.

Kestrels, keen-sighted though they are, sometimes get into trouble on their piratical expeditions. One of these birds was seen to drop, in the characteristic stone-like fashion of its kind, on some object in a field over which it had been hovering. It rose with a small animal struggling in its claws; but soon began to show signs of distress, and to fly heavily and painfully. At last it fell fluttering to the ground. On the man who had watched the proceedings going up to see what had happened, a weasel, apparently uninjured, slipped from the body of the dying bird, and disappeared. A wound in the throat of the kestrel explained matters. The hawk in catching the weasel had caught a veritable Tartar. The weasel, objecting to be made a meal of by the hawk, had managed to wriggle his lissome body round and inflict the wound. Last April, a gamekeeper in Norfolk found a kestrel and a small rabbit in the same trap. The trap was one of the ordinary toothed abominations which close with a spring, and had been set close to the mouth of the rabbit's hole. Once closed, such a trap remains closed till it is reset. How, then, could both kestrel and rabbit have been caught in it? Probably the kestrel struck the rabbit a little way from home, and the victim in its struggles dragged the murderer into the trap's deadly grip.

It is of course chiefly in defence of their young that birds and animals show most courage. Black-birds often succeed in driving cats from the neighbourhood of their nests; while it is upon record that a rook, single-handed, drove away with ignominy three ravens which had approached her young with marauding intentions. Those terrible harriers of farmyards, sparrow-hawks, are frequently put to flight, and sometimes even meet with their death at the beak and claws of the infuriated hen whose chickens they seek to capture. Indeed, some hens, as most people know, will not allow a strange human being to approach their broods without rushing at him with ruffled plumage and extended wings.

One would imagine that a cockchafer was a still more harmless 'beastie' ordinarily than a hen, and yet a cockchafer has been known to prove more than a match for a bat. It happened in this wise: Two people were out walking one summer evening in the country, when they were startled by something falling suddenly at their feet. Stooping to see what it was, they found a small bat with a cockchafer clinging firmly to its side, just under the wing. The cockchafer was removed, and the bat resumed its flight.

A few years ago, in one of the low-lying parts of Surrey, a snipe was picked up dead with a freshwater mussel firmly attached to the end of its beak. The valves of the shell had closed on the snipe's beak, and the unfortunate bird was thus held prisoner till it died of starvation. Both bird and shell were preserved as a literal example of the biter being bit.

A wasp caught in the meshes of a spider's web proves a very ugly customer for his capturer to tackle. The wasp says to the spider, in language

there is no mistaking: 'You had better beware my sting.' The spider, keeping at a respectful distance, does her utmost to set her unacceptable captive free. She makes no attempt to 'rope' him by throwing her toils, thread by thread, around him, as she would do if it was only a blue-bottle with which she had to deal. On the contrary, she seconds the efforts of the wasp to escape by shaking her web violently.

A cock-pheasant once found himself placed in a very awkward predicament, thanks to his inveterate love of fighting. A young lady, wearing a red cloak, was walking in a country lane, when she was flown at and set upon violently by a handsome cock-pheasant. The pheasant seems to have taken the lady, from her scarlet cloak, for some large strangely-plumaged bird trespassing on his domain. The young lady tried in vain to repel his attacks, until at last she was compelled to seize him and carry him home with her bodily. When she reached home, she let her prisoner go free, and off he stalked, trying, by a show of dignity, to conceal his chagrin at having thus caught a Tartar.

WHAT MIGHT HAVE BEEN.

SHE was never married, our dear old Aunt,
Our mother's old Aunt Bess;
We girls could never imagine why,
Though we often tried to guess.

Her sweet old face, her wistful smile,
And her eyes that seemed to say:
'I too had a lover once, my dears,
In a long past yesterday.'

We were a party of merry girls
Who never had known a care:
Our heads full of lovers and love affairs,
And our hearts as light as air.

One evening, our youngest, our winsome Kate
(Her own wedding day was near),
Said: 'Why had *you* never a wedding day?
Ah! do tell us, Auntie dear.'

But the sweet blue eyes grew sadly dim
With tears that did not fall,
And a faint flush tinged her cheek as she said:
'My dear, he ceased to call.'

A sudden hush fell over us then—
Our heart-beats you might have heard,
As she slowly rose and left the room
With never another word.

* * * * *
Ah me! since that April afternoon
I have seen both shower and shine,
Katie married—and Winnie dead—
And a lonely hearth is mine.

And oft in the quiet evening hour,
When the silent shadows fall,
I think of my dear old Auntie Bess,
And her lover—who ceased to call.

LIMITS AND LIMITATIONS.

BESIDE the Limits which human beings have to acknowledge as such, there exist a man's own personal Limitations to be reckoned with. The practical philosopher, in the person of Mr Besant—vide his *Eulogy of Richard Jeffries*—bids him find out those limits, work in them, and be content. This advice, though little other than the heathen sage's, 'Know thyself,' since to know one's self argues a knowledge of one's limitations—to carry this advice into effect requires a certain amount of insight, acquired by an uncertain amount of effort. One may be the 'limited little brute' Miss Bella Wilfer called herself, and yet never attain her insight to perceive and her candour and courage to avow her limitations. There are those whose limitations, perfectly perceptible to those about them, remain a profound secret to themselves all through their lives; and there are those whose apparent limitations—patent enough to all appearance—are in reality mere sheaths and husks, which in the course of their development will be sloughed and cast aside, as they emerge and make 'a large room' for themselves. Genius may be safely trusted to find this room for itself; sometimes it takes the expression of a belief in its limitations as the signal for it to transcend those limits, as Lord Byron did. Or it will retire into a ten years' silence, as did Lord Tennyson, before finally emerging as one of the Immortals. Or it will be magnificently indifferent, as was Burns, as to whether what he had in hand would turn out 'a sang' or 'a sermon.'

And not in poetry only may genius be found overstepping the ordinary limits of mankind. In one profession, notably, where nature would seem, at first sight, to have fixed the boundaries of a man's career, she will, by endowing him with a Promethean spark, enable him to conquer what looked like her own limitations. Though the man to whom she has given a commanding presence, a tragic cast of countenance, and a deep voice, restricts himself, if he be wise, to playing

tragedy and melodrama; while he who is gifted with comic features, insignificant stature, and endless drollery, labours in his vocation when he plays the fool; a third, of ordinary, or even plain and unattractive form and features, but whose lips have been touched with a live coal from the altar, will, like Rachel, secure histrionic triumphs to which the merely beautiful or graceful in vain aspire.

And while thus considering the large room genius makes for itself, it may not be out of place here to inquire why it is that the mothers of men of genius are credited with so large an influence in the development of their sons' capacity, and that an attempt is seldom or never made to lift the fathers on to a similar pedestal? It may be that a man, without being exactly incredulous of his offspring's intelligence, has been made, by experience and contact with the world, cautious in crediting any one, even his own son, with a capability of doing, until something has been done, and that this atmosphere of incredulity, unfavourable to the development of talent, as it is allowed on all hands to be, constitutes the difference of training which the child receives at the hands of its parents.

As the soil is to the plant, so is its environment to the young soul, which, though it may, by flattery or over-indulgence, foster the ill weeds of conceit and self-sufficiency, may, and does, on the other hand, dwarf and warp its growth by a stunting diet of incredulity or disparagement. It is a common observation that youth can do itself more justice, be more 'itself' among strangers, than at home, where nothing is expected of it; and thus it is perhaps that home-keeping youths have ever homely wits; while abroad, free from the heavy, incombustible atmosphere that a presumptive acquaintance with their limitations imposes, they branch out into sallies of sense or humour. Falstaff complains jestingly that not only is he witty himself, but the cause of wit in others: in a similar manner, there are those whose dullness is a cause of dullness in others. The limitations of Napoleon III.'s intel-

ligence, the influence of his entirely negative intellect, are said to have been such as to infect the consciousness of all who came in contact with him. 'I cannot talk, with Civet in the room,' says Cowper, 'a fine puss gentleman who's all perfume.' The perfume may be a very fine perfume, an art-jargon that babbles of the 'tender rendering' of a boot-jack, or the 'sympathetic *timbre* of a baritone;' or it may be merely the perfume of the 'shop' to which the speaker is attached, but it suffices to choke the general auditor. A man of Dr Johnson's extended powers no doubt was right in feeling complimented when he heard that a lady had said of him—speaking to one who complained of having been in a company where only 'runts' were talked of—'Well, sir, Dr Johnson would have talked of runts;' yet even he confessed to Boswell that he felt the tediousness of the company of his old schoolfellow, whose 'talk'—like that of the man in Ecclesiasticus—'was of bullocks.'

That it is of great importance to a man in any walk of life to find out his limitations cannot be denied. It is a pitiful waste of time for a man to pass half a lifetime trying to catch hold of something which he has no real power to grasp. Yet this ignorance of the limits of his powers is often the result of outside influence. 'That which one can do, another may do,' is re-echoed around the neophyte; and giving credit to this untruest of axioms, he allows himself to be entered for a race beyond his strength; urged and goaded into attempting that which is permanently beyond his powers. An addiction to a study, an art, or a business which comes spontaneously and from within, may generally be trusted; while that which is the result of pressure, or a morbid and over-stimulated ambition, usually bears but one fruit—failure. On the other hand, to dwell on one's limitations, or to have them daily insisted on, is comparable to placing a transparent but impassable globe over a butterfly, and then demonstrating the futility of its powers of flight. We have seldom admired the surpassing beauty of the 'Prentice's Pillar' in Roslyn Chapel without an inward conviction that it owed its creation in no small degree to the absence of the Master, an absence which left the 'Prentice free to find out his own capabilities for himself.

In some directions, the limits of a man's powers are not difficult of determination. For instance, there seems to be a point in the game of chess beyond which an ordinary player does not easily pass. His capacity to unravel the intricacies, foresee and provide against the contingencies of that wonderful game, is, so to say, exhausted; and he who constantly succumbs to his opponent's power of combination and dexterity in marshalling his forces, may fairly be said to have found his limit—in that direction at least. He, too, who perpetually loses his head, or his way, in the analogous game of life, may safely suspect the limitations have been reached of his own perspicacity and foresight.

But it is obvious that, while certain of our powers seem doomed to the strictest limitations, there are other and not less noble ones, capable, apparently, of almost unlimited expansion. That by no manner of means may an oak-tree be evolved from a cabbage, we freely admit; but

unless a soul is granted to a cabbage, or denied to a man, the analogy will not hold good. While the limits of speculative thought first discovered have in scarce any direction been since overstepped, the delimitations of the frontiers of morality are—and have been—progressive. As in the world, so in man; while incapable perhaps of adding an intellectual cubit to his stature, he may—nay, frequently does—exchange a capacity for an acquirement. It was possible for him to be charitable; he is beneficent. Few suspect the depth of their own power of endurance until an inexorable fate calls it forth, and it becomes—heroism. Pity is exalted into a divine compassion. Under the nettle Disappointment, grows the flower Humility. From the perception of benefits spring gratitude and love, and the joy of living on so beautiful a globe, hung like an iridescent air-bubble in the firmament! Even the brevity of the allotted span of life—its incertitude, its mystery, its pain—is but the exchange of an earthly vitality for a divine vitality. In short, while a Darwin converts himself into a machine for grinding out facts, by means of which may be evolved an all-important law of nature, each human being possesses within himself the power, not merely of observing, but of enlarging the limits of the divinest part of himself—that which constitutes his character, and is, so to speak, the protoplasm of his soul. Self-possession, self-control, self-command, all that made the glory of the philosopher, are merged in the humility which trusts in the highest, the greatest, and wisest, as well as the most infinitely tender of Guides.

THE BURDEN OF ISABEL.*

CHAPTER XXXIV.—THE TAME PHILOSOPHER IN DANIEL'S DEN.

ALAN AINSWORTH went to his rooms that night treading on air, singing and making melody in his heart. He loved his love, and his love loved him—loved him truly, freely, and unreservedly, as only a noble, generous-tempered woman does love. There were difficulties, to be turned rather than surmounted; but they only added a zest to his feeling, for he was in no doubt about the issue. His sweetheart had surrendered herself to be guided by him: she had sweetly bent to him; and he was a new man. He felt strong, and he rejoiced. His two successes coming together had this great effect on him. He had been very doubtful whether the public would care for his play: and they had received it with acclamation. He had frequently been despondent in his love—had often wondered if a rare creature like Isabel could find in him anything at all: and she, who had hitherto appeared stronger than he—stronger in mind and in heart—had yielded to him as the lord of her life. So he was strong and of a good courage—of a temper to be daunted by nothing that might arise. He knew that it was rather because of her own generous quality than because of his supreme desert that Isabel had yielded herself so ungrudgingly, but yet the effect on him was the same as if his own merit and his own hand had gotten

him the victory. Herein is the infinite reward of true love, that, with the flattery of feeling on the one side, and on the other—of homage and devotion—we come to believe our poor little best qualities to be active and constant, and in so believing we cultivate them into activity and constancy.

As for Isabel—when her lover had departed, she began to brood despondently upon the pain she must give to George. It seemed more difficult than ever that she should break with him. She imagined herself going to him and saying: 'You have generously loved me, I believe, all your life, since we were boy and girl together; and you asked me to be your wife, and I have agreed and have led you to suppose that I loved you. I now find that I do not love you truly, and that I cannot marry you! For your faithful love of a life all I can give you is a broken promise!'—and she shrank from it with shame and alarm. It would be easier to write that, but it would be cowardly to seek to shun the full shame of speech; and she could not come to speech with George at once. But, as Alan had said, 'One thing at a time.' She had promised to go to her uncle on the morrow and make him take over her money. But would not her uncle laugh at her, and think her gone mad? Yet she had promised, and she would go, and perhaps something might come of it.

On the afternoon of next day, therefore, she went to Rutland Gate. She asked the important person in black who opened the door if her uncle were in; and he replied that Mr Suffield was not at home—was gone back to Lancashire—but that Mrs Suffield was at home. That seemed to her strange and ominous, but she followed the footman into the drawing-room, where Mrs Suffield sat alone, with a book in her lap, as if she were reading.

'Is anything the matter, aunt?' asked Isabel, 'that uncle has rushed off again to Lancashire?'

'Is anything the matter, my dear,' retorted her aunt, 'that you have rushed in now, when we only parted from you yesterday?'

'Yes,' said Isabel, on the inspiration of the moment; 'for some time I have had a feeling that something was going to happen to uncle. The feeling has come and gone; but to-day it has been specially strong. Is anything wrong? You know all my money—all I have—I would gladly give to help uncle!'

Her aunt considered her closely, and then went to her and kissed her with tears in her eyes. 'You are a good girl,' said she. 'All I know is that that M'Fie came to him this morning with some strange story; that he was very much upset, and said he must go down to the north at once. I never,' said Mrs Suffield anxiously, 'never knew him do a thing like that before—go off without telling me what was the matter.'

While Isabel is talking with her aunt, it is necessary that we should occupy ourselves with this business of M'Fie's. He had come to the horse betimes that morning, looking—as the footman said to his master—'very ill, indeed, sir—wuss than usual, and 'is 'ead tied luv!'

The Tame Philosopher had, for once, a story to tell instead of a rhapsody to deliver. But his manner of narration partook largely of the

rhapsodical from sheer habit; for certainly he was too much moved and too much in earnest to be consciously choosing his words.

'Bless my soul!' exclaimed Suffield when he saw how pale he looked with his head tied up in a white handkerchief. 'What in the world have you been doing with yourself?'

'Ah, my dear sir,' said M'Fie, wringing his patron's hand, 'the pains of Gehenna have gat hold upon me! I have had an adventure, sir, which to my poor experience in that kind surpasses everything I have ever read of *Arabian Nights' Entertainments*—of barbers, and negroes, and one-eyed calenders. It is so strange that you cannot imagine it even in dimmest, most indefinite prefigurement. And when I tell it to you, you are likely to listen with incredulous ear.'

'Well, my friend,' said Suffield, 'I make no promise of listening with one sort of ear or another; but I must bargain that you tell me only the truth. Come into the library.'

'What is truth?' said jesting Pilate,' quoted M'Fie, as he followed his patron, 'and would not stay for an answer.' I would have you observe, sir,' said he, when they were in the library, 'that I am about to give you an unvarnished narrative of my adventure, and I have to bespeak your earnest attention, because it concerns yourself, sir.'

'Concerns me—does it? Well, fire away, and let me hear.'

The Philosopher was too much interested in his adventure even to correct his patron's un-literary expression. He began his narrative, and Suffield listened with interest. In effect it was as follows:

On Thursday evening—that was Tuesday—the Philosopher, having his time on his hands while his patron was making holiday in Lancashire, and having read in the newspapers of the success of his young friend Ainsworth's play, resolved that he would spend half-a-crown for a seat in the pit to witness the play and judge if the approval of the public was justified. When he took his place in the throng waiting for the doors to open, he observed a little way in front of him a white turban. When he had pushed his way in and taken possession of a seat, he found himself immediately behind the white turban. While studying his bill of the play and his halfpenny newspaper, and considering the talk and the countenances of his neighbours before the play began, he negligently observed that the owner of the white turban—who he could casually see, had the dark face of an Indian or Hindu—kept taking surreptitious sucks at a bottle which he produced from the pocket of the dark overcoat he wore. The play began, and he was interested in it, and incurious about the owner of the white turban, who had seemed progressing so rapidly on the way to tipsiness. But at the end of the first act, when all around began to discuss the play, the owner of the white turban began also. He addressed himself to his neighbour, a harmless, good-natured-seeming young man, who rather encouraged than resented his conversation.

'This is silliness,' said the white turban. 'I am regret that I give away my half-the-crown to sit here to listen with regard to this. Do you

think the same, sir? I must say the times the halls of music visited I pay one shilling—not half-the-crown!—and I am handy for the pipe and the glass, and I am not squeeze by my respected ones next me. With regard this is not good, not economical. And in the halls of music they make me laugh down to my stomach, with regard here if care should be taken I make a simper of pleasure. This is silliness!

There was no mistaking that guileless voice and that wonderful turn for correct English: a single peep round the dark man's cheek assured the Philosopher that the owner of the white turban was none other than Daniel Trichinopoly.

'Of course—Daniel,' said Suffield. 'Taking his Christmas holiday in London, and enjoying himself in his own way.—But how, my friend, does that concern me? My son told me he was in London.'

'Oh, did he?' said the Philosopher. 'Well, my dear sir, I am not at the end of my story yet. Wait, sir, and listen.'

At the end of the second act—during which Daniel frequently partook of his private refreshment—the same kind of talk was resumed, Daniel adding to such comparative criticism as he had before uttered that he knew the gentleman who had 'made' the play, and that he hoped that he and his friends were well, and that they would continue very well. As for him (Daniel) he did not care for anybody: he could spend his 'half-the-crown' or his 'one shilling' with as much freedom as any 'Ki-lis-tian' gentleman in the Queen's empire, and—with that the play went on again.

'Still I don't see, my friend,' said Suffield, 'what the tipsy twaddle talked by Black Daniel has to do with me.'

'My dear sir,' said the Philosopher, 'you will see in a precious moment.'

It was after the third act that Daniel—being then very tipsy and communicative—drew from his inner pocket a large envelope, from which he took some folded sheets of tissue-paper. He spread them before his neighbour, and boasted of the value of the drawings on them.

'I beg to mention,' said Daniel, 'that these pictures, lines, circles, etcetera, etcetera—in red ink and in black—are with regard to a very clever machine valuable for the manufacture. With attention to these I now take away and make, and I may say I shall have a small or large fortune by the favour of it.'

A strong suspicion made the Philosopher rise to look at these drawings over Daniel's shoulder. He discovered that the lines had clearly been first traced with pencil and then gone over with ink by a somewhat awkward hand, and that they were undoubtedly copies of drawings he had seen before. What drawings?

'Now, what drawings would you guess, sir, in your acutest and directest vein of guessing?'

'What drawings should they be,' asked Suffield, 'that I know ought about? What should be done wi' a sheep's head but make broth o't?'

'Mr Suffield,' said the Philosopher, 'with listening to the havers of fools and rogues in Parliament, I must tell you your wits have become dulled. Your business activity, since it ceased to be active, has lost its sharpness. What drawings should they be that I'd take trouble to tell you this

screed of a story about but the drawings of your own cherished, secret machine?'

'What? The black scoundrel! He has copied the drawings, has he? That's George's carelessness!—But go on wi' thy story. What didst thou do?'

The Philosopher answered, he could do nothing there and then; but he considered that, since Daniel had stolen copies of the drawings for use, he could hardly intend to return to his post in Lancashire. Waiting, therefore, till the play was over, he followed the white turban from the theatre and down the Strand to Chancery Lane, where it mounted to the top of an omnibus going eastward, and he followed. The Philosopher confessed that he had no thought of committing violence—even if he had been able—he was only steadily resolved to see where the black Daniel was going to bestow himself. On the 'bus they sat almost back to back, and the Philosopher could not but imagine that a powerful man might just twist himself round in his seat, put his arm about, and garrotte the head that wore the white turban, and abstract the large envelope from the inner pocket. Thus they rode eastward and still eastward, Daniel murmuring to himself without ceasing all the way. Somewhere in Whitechapel—the Philosopher could not tell where—the white turban descended from the 'bus, and the Philosopher followed. He followed along strange alleys by queer turnings, slippery and noisome, until he began to suspect that the white turban was aware it was followed; how it had become aware the Philosopher could not guess; but the Philosopher had never before tried to be a detective. The white turban twisted this way and that, and now and then drew up in a pause, when the Philosopher drew up, too, and caught the gleam of a bright eye from under the turban. At length the white turban disappeared into a doorway; the Philosopher moved carefully up to observe the number, when the white turban pounced out upon him, the hands of Daniel gripped his arms to his sides, and the voice of Daniel murmured: 'Ah, it is the old Guru! It is the sayer of wise things! It is the wise one himself alone without his disciple! I am regret to say that my entertainment is very little for a Guru. But with regards come to see where I have the dwelling.'

There was that in Daniel's eye and manner which hinted that his invitation was not to be refused; and the Philosopher, who was not a man of great physical courage, yielded to the gentle urgency and pressure of Daniel's muscular black hands, and went along with him, saying: 'Certainly; I will look at your dwelling.'

'Do you know what you should have done?' said Suffield, who was now marching up and down the room. 'You should have called a policeman, and given him in charge for being in possession of property of which he could not give a reasonable account. That would have nailed him.'

'But,' said the Philosopher, 'there was no policeman to be seen: it was a terrible savage region!'

'I mean,' said Suffield, 'you should have done that as soon as you left the theatre, instead of following him all the way to the Docks; that, I suppose, is whereabouts you were?'

'Not quite,' answered the Philosopher. 'But I should have denounced him to a man in blue at once—should I? I did not know,' said he despondently. 'I am not familiar with the methods of dealing with crime and its detection. And the whole business,' he added with a flash of virtuous indignation, 'was as smoke in the eyes and stench in the nostrils!'

'However,' said Suffield, 'go on wi' thy story.'

The Philosopher passed on, while Daniel guided him by the arm into a narrow court or alley. They went on, stumbling in darkness and dirt, until they arrived at a door above which was a small oil-lamp. Daniel lifted the catch and walked in, and the Philosopher to his amazement saw he was in a place like the fore-castle of a ship. The room was filled with a peculiar brown vapour or smoke, such as the Philosopher had never before seen, smelt, or tasted.

'Opium,' said Suffield.

'And that is just what it was, my dear sir,' said the Philosopher.

Daniel entered into converse in an unintelligible tongue with the Chinese master of the place, who came and bowed and grinned before the Philosopher, and said: 'Come; smokee pipee. Velly cheap; not velly dear!' The Philosopher protested that he did not wish to smoke a pipe of the noxious drug; that while thanking his 'friend' for the offer he would much rather not. But the Chinese master of the place insisted with Celestial politeness, and took the Philosopher by the sleeve to lead him along. The Philosopher resisted, and angrily remonstrated, while sundry dark heads with lack-lustre eyes lolled over the edge of certain bunks. At that he received a blow on the head, which made him drop, stunned: he believed the treacherous Daniel had dealt it.

'Humph!' exclaimed Suffield. 'And that accounts, I suppose, for the clout about your head. And you saw the Daniel Nathaniel no more. I thought that was to be the end!'

'But that, my dear sir,' said M'Fie, 'was not quite the end. I came to myself'—

'It was the end so far as Daniel was concerned,' said Suffield, still marching up and down. 'He had got rid of you. And you came to yourself, I'll be bound, with being made to swallow opium smoke or a bit of opium; and they kept you there sick and sleepy, and you did not get out of that for some time.'

'Now,' exclaimed the Philosopher, 'it is very clever of you to guess that; for that is just what occurred. The Celestial person made me smoke one, two pipes of his obnoxious preparation, and I could not leave the place till late in the afternoon of Sunday.'

'Sunday! Of course!' said Suffield. 'That was all arranged! The Daniel creature wanted to get away, and to make sure that you could not come and tell me or any one else that you had seen him until he had time to do something! Where can he have gone? Why didn't you let me know at once, my friend?'

'I thought, my dear sir,' answered the alarmed Philosopher, 'that you were still in Lancashire. I wrote to your son as soon as I got back to my lodgings; and then I came here to-day, thinking that peradventure you might have heard, and come back.'

'You wrote to George! And he knows then!

—if he's at home!—That rascal Daniel must be found, you know! I must go to the police!—You'd better come with me.'

They went out together at once, took a cab, and drove to Scotland Yard. The Detective-Inspector to whom they were introduced saw clearly the importance of the matter.

'The thing's not patented, you see,' said Suffield; 'and if it is made public, or if it gets into another manufacturer's hands, it means thousands of pounds loss to my business. So spend as you think necessary to find the black scoundrel.'

'You do not know yet,' asked the Inspector, 'if he has taken anything else?'

'I can't tell till I've seen my son, who has been managing the business. Where can the creature mean to go to?'

'Back to his own country, probably,' said the Inspector. 'But is it of any use his taking plans of machines there? He may have gone to the States; but Liverpool would have been better for that. Yet—haven't I heard that they are building cotton mills in Bombay now?'

'They are,' answered Suffield; 'and depend on it that's where he's gone!'

'Very likely,' said the Inspector; 'but we must look all round.'

Suffield returned to Rutland Gate to eat his lunch with little appetite—and to tell his wife what had happened—to get a few things packed into a portmanteau and to take the train for Lancashire.

HOW TO JOIN THE ROYAL NAVY.

In these days of keen competition for employment, when men of moderate means scarcely know what to do with their sons, it is surprising to find how comparatively few parents are acquainted with the rules governing the admission of candidates to the public services. Perhaps this is one of the reasons why boys who display no very strong bent for any particular calling so frequently follow in their fathers' footsteps. Sometimes the sons of well-known professional men do succeed in the same line; more commonly they attain but moderate success; but it is indisputable that young Englishmen very often follow the parental lead simply because Paterfamilias has neglected, until too late in the day, to study the rules of entry to other professions. How often one finds, for example, that a military officer puts several sons into the army, that lawyers' sons are trained to be lawyers, and that a clergyman's sons drift into the Church; and how very, very frequently in after-life the unsuccessful man has cause to regret his father's lack of imagination. According to Mr Beerbohm-Tree, this desirable quality is highly developed in actors, yet it is notorious that actors' children usually take to the stage. Now, there is at least one profession open to young English lads which is not, strictly speaking, overcrowded. We allude to the Royal Navy; and although we may fairly claim to be the greatest maritime power the world has ever seen, there can be no doubt that universal ignorance prevails among civilians as to the rules of entry to this attractive service. Our object in the following paper is to give parents

some authentic and definite information on this subject.

When we hear that young hopeful is going to adopt a naval career, we usually assume that his ambition is to become a British admiral—perhaps even a second Nelson. This is indeed a very laudable ambition; but whilst there are only a few admirals—at all events on the active list—there are several other branches of the service open to lads with an inclination for a sea-life. The combatant or executive branch of the navy affords greater opportunities for distinction than the non-combatant; but although there are more prizes in the former, there are also more blanks; and many a soured old lieutenant, with no prospect of further promotion, has wished, ere now, that he had adopted one of the other branches of his profession. These other branches are as follows: The Royal Marines, Engineering branch, Accountant department, Chaplains' department, Naval Instructors' department, and Medical branch.

The Combatant branch.—Every young man who aspires to become a combatant naval officer is required to pass an examination for admission to the Cadets' training-ship at Dartmouth. This system was established in 1859; but it is noteworthy that the system of open competition—introduced into the army on the abolition of purchase by Mr Gladstone—has never been fully extended to the navy. The entry of naval cadets, for example, is regulated by strictly limited competition, and this is effected by issuing nominations. The Admiralty are now entering about one hundred and twenty cadets annually, and this number is likely to be maintained for some years to come, owing to the deficiency of lieutenants. The examinations of nominated candidates are held twice a year, and not more than three candidates are usually permitted to compete for each vacancy. As may be imagined, these nominations are eagerly sought for, but often too late by parents who are unacquainted with the rules. We must not pause here to criticise the system under which the nominations are bestowed, but cannot refrain from stating that it is distinctly open to criticism and unlikely to last many years longer. It is sufficient for our purpose to explain that, with a few exceptions, all the nominations are in the gift of the First Lord of the Admiralty. The individual members of the Admiralty Board have a few at their disposal; whilst every admiral is allowed one nomination on his appointment to a command, and every captain can also claim one nomination within six months of assuming his first command. If one has no connection with the navy, the only chance of securing a nomination for a cadetship is to make early application to the First Lord of the Admiralty, or to enlist the sympathies of some influential friend. It must be admitted, however, that this branch of the navy is still a close preserve.

Candidates for the 'Britannia' are required to pass the examination between the ages of thirteen and fourteen and a half years; and some special preparation—in other words, cramming—is invariably required. The test is not a difficult one; but as there are not fewer than three candidates for each vacancy, it is necessary to obtain more than merely qualifying marks. From six months to a year's cramming is usually needed for an

average youth whose previous education has not been absolutely neglected; but even clever boys should be sent to one of the crammers for a few months. It would be beyond the scope of this article to give any particulars of the subsequent examinations to be passed by a cadet before he is fairly launched on his naval career. We need merely state that although a naval officer has many tests to pass before he attains the rank of Lieutenant, these examinations present few obstacles to young men of average ability, owing to the excellent system of training.

We may now pass on to the rules governing admission to the other branches of the navy.

The Royal Marines.—This is a distinct and also a combatant branch of the naval service, and although the officers are virtually soldiers, they are under the control of the Admiralty, and are paid out of the naval votes. The Royal Marines are divided into two separate corps, the Artillery and the Light Infantry, the officers of the former receiving special training in artillery-work. The Royal Marines affords a very good career, and is much less expensive than the Army, only a small allowance being needed by officers in the junior ranks. But we have no space to draw any comparisons between the advantages of the different branches of the navy, and must assume some knowledge on these points on the part of our readers. Candidates for the Royal Marine Artillery are required to pass the same examination as those for the Royal Artillery, and this is the only branch of the navy, except the Engineers, which is open to general competition. Candidates must compete between the ages of sixteen and eighteen years. The number of vacancies rarely exceeds six in each year; but although this appears to indicate keen competition, the bulk of the successful candidates elect to enter the Royal Artillery in preference to the Marines. Still, the test is a very severe one, for, as we have explained, the standard of knowledge is precisely the same as that required for admission to Woolwich. The successful marine artillery candidates are subsequently trained at the Royal Naval College, and at the naval gunnery and torpedo schools. They do not go through Woolwich at all.

Candidates for the Royal Marine Light Infantry are also entered by open competition, and are required to compete with the Sandhurst candidates. This system ensures the entry of young men of the same mental capacity as the future officers of the infantry of the line. Hitherto, the limits of age have been between seventeen and twenty; but this summer the maximum has been reduced by one year. Candidates for this branch of the navy are required to be not less than five feet five inches in height. The number of vacancies offered half-yearly has varied of late between four and ten, according to the flow of promotion in the corps. The successful candidates are gazetted to the three Marine Divisions at Portsmouth, Chatham, and Plymouth, and are usually attached to the same division throughout, except when serving afloat. The two branches of the Royal Marines make up a force of fourteen thousand officers and men.

The Naval Engineering branch.—The entry to this branch of the navy, which has greatly in-

creased in importance of late years, is regulated by open competition; but the Admiralty reserve the right of nominating candidates for one-third of the vacancies. These nominated candidates are admitted if successful in obtaining qualifying marks, and are not required to compete, in the ordinary sense of the term. The nominations are exclusively bestowed upon the sons of naval or military officers killed or injured in the public service. Three nominations are also offered to the sons of colonial gentlemen, with the object of tightening the bonds between the mother-country and her colonies, and bringing about what Mr Morley might describe as a naval 'union of hearts.' Including these nominated candidates, from thirty to thirty-four engineer students are entered annually, and the competition is about five to one. The age of admission is between fourteen and seventeen, and cramming is considered necessary, although no technical subjects are included in the examination. The students are educated at Keyham College, near Devonport, and here they remain between four and six years, according to their progress. During this course of training, parents are required to pay forty pounds per annum. A student's outfit costs about twenty pounds; and the total fees, including washing, amount to under seventy pounds. In return for this moderate outlay, the students receive a first-rate technical education; so thorough, indeed, that it has been found necessary to guard against the possibility of parents subsequently withdrawing their sons from the navy with a view of making them civil engineers.

There is also another way of becoming a naval engineer, and for this method of entry candidates are eligible up to twenty-three years of age. They are required to pass an examination for direct admission as assistant-engineers, but are not accepted unless they have previously undergone three years' training in an approved engineering establishment. About ten such appointments are offered annually; but very few engineers enter the navy through this channel, very possibly because the regulations on this head are imperfectly understood.

Medical branch.—The rules governing the admission of surgeons to the navy may be briefly dismissed. The candidate must be fully qualified to practise medicine and surgery in the United Kingdom, and must be under twenty-eight years of age. The exigencies of competition have, however, led to the necessity of imposing further tests, the vacancies being awarded in order of merit by the examining Board. The competition varies so much that it would be difficult to estimate accurately the average number of candidates. In 1888, only seven surgeons were entered; but the average number of vacancies has been twenty-two during the past four years. The medical officers of the navy receive higher pay than the combatant and engineer officers of corresponding rank, and the regulations governing retirement are framed on a liberal scale. This is chiefly due to the influence of the medical profession on shore, which, some years ago, successfully resorted to the expedient of boycotting the navy, until the Admiralty were forced to make concessions. After eight years' service, a naval surgeon has the option of retiring on a gratuity of one thousand pounds; and after

twenty years' service, he can claim a pension of £365 per annum. Higher pensions than this can, however, be obtained by additional service, and by officers who rise to the top of their profession.

Naval Chaplains.—There are probably thousands of struggling clergymen in this country who would be glad to join the navy as chaplains, and it is certain that a great number of applications are received by the Admiralty when a vacancy occurs. The superabundant supply of candidates is no doubt partially attributable to the fact that no examination has to be passed, although perhaps this would be the fairest way of deciding the claims of clerical applicants. There are only ninety-six naval chaplains, including the Chaplain of the Fleet; but during the past ten years we find that, on an average, five fresh appointments have been gazetted. These posts are in the gift of the Admiralty, and a good deal of interest is required to obtain a chaplaincy. The pay of a naval chaplain begins at twelve shillings a day, and increases to four hundred pounds per annum; whilst those who are also qualified to act as naval instructors receive considerably higher pay. Like all other officers of the navy, chaplains are entitled to pensions; but no pension is granted for less than ten years' service, except in cases of injury sustained on duty. It may be interesting to mention that naval chaplains formerly ranked with rear-admirals, although the pay was no higher than at present—but that nowadays they do not take rank at all, the regulations merely specifying that they are to be treated with the respect due to their sacred calling.

Naval Instructors.—The duties of a Naval Instructor are to instruct the midshipmen in sea-going vessels in mathematics and navigation; whilst a few are employed on board the cadets' training-ship, and also as lecturers at the Royal Naval College. Of late years, the policy of the Admiralty has been to combine the duties of chaplain and naval instructor in sea-going vessels; and the plan has worked so well, that it will no doubt be continued. More than half the chaplains have qualified as instructors; but a small number of naval instructors not in holy orders will always be required for the 'Britannia' and the Naval College. Several of the original naval instructors have become chaplains, just as the chaplains have qualified as instructors, although it may be considered that this is not a responsibility to be as lightly undertaken as the teaching of middies. Candidates for the position of naval instructor must be under thirty-five years of age, and are required to pass rather a severe examination in mathematics, Latin, and French; and the vacancies are offered for open competition. The successful candidates are subsequently sent to the Naval College to study navigation and a few other technical subjects, and are then subjected to a final examination. The pay of a naval instructor is the same as that of a chaplain, and pensions are granted on the same scale. The duties are light, and the naval instructor enjoys the status of a commissioned officer; but capable young schoolmasters are not greatly attracted, as a rule, by this branch of the navy, which has little beyond a fair pension to recommend it.

The Accountant or Paymaster branch.—The

officers of the Accountant branch are entered as assistant clerks, under the same system of limited competition that governs the admission of naval cadets—that is to say, nominations are required. The number of nominations issued by the Admiralty varies from year to year; but about four candidates are allowed to compete for each vacancy. Candidates are eligible for the examination between sixteen and eighteen years of age, and of late years about eighteen vacancies have been offered annually. The examination is not a difficult one, apart from the competition; but it is essential for candidates to be well grounded in arithmetic, elementary mathematics, and composition, and also in French. This branch of the navy can be entered at smaller expense than any other, and although the pay is not very good in the junior ranks, the Paymasters are well paid, and can retire on six hundred pounds a year after twenty-seven years' service in that rank.

In this paper no attempt has been made to do more than briefly describe the general rules governing the admission of officers to the several branches of the navy; but it is hoped even those few particulars will be of some service to parents with sons on their hands. Fuller particulars can always be obtained by application to the Secretary to the Admiralty; whilst much useful information will also be found in the quarterly issue of the 'Navy List.' It is perhaps scarcely necessary to add that candidates for every branch are required to pass a strict medical examination, and that robust health and normal physical powers are as essential to a future surgeon, paymaster, or engineer as to a midshipman or an admiral. To be sure, many officers lose their health, and sometimes even a limb, during service; but good physique at the outset is a *sine quâ non*. If Lord Nelson had lived half a century later, our greatest naval hero would probably have been disqualified by a medical Board, in which case many important events might have happened which need not here be discussed.

CHARLES GLEIG.

ELSIE.

CHAPTER II.

As time went on, I found myself thinking as much of young St John as of Elsie. He had come into the peace of our village life like a dragon-fly in a garden, giving one a sense of disquiet, which the butterflies and bees never do. I speak for myself, for every one else said how quiet and nice he was. Before a week was over, half the women in the place were in love with him, and I didn't wonder at it, though I got to hate his suave ways and his marvellous blue eyes. I knew which way they were turning, and that Elsie had looked into them, and had caught something from them which was altering her daily. He acted indeed like a sun on her: she seemed to grow taller, more queenly: her eyes took a soft dreaminess to them, and in the curves of her lips there was a richer swell.

For her sake I ought to have been glad that love had come to her with its creative touch, making the world all new again, and hallowing it with sweeter meanings, which before she had

never known. But all the while I had misgivings when I thought of the vicar's pride of birth—he was an Hon. Rev.—and the possibility that the young graduate was only butterflying after all. I misjudged him, as I came to know afterwards; but jealousy had twisted me, and my thoughts worked 'out of the true,' like a wheel on a bent axle.

But as far as Elsie was concerned she seemed happy enough, till the day after their picnic in the park, when something occurred which made my heart ache for her. I thought it was coming when the vicar passed on his way to the mill-house, for there was anger in his face and a hard uncharity quite foreign to it. In the space of twenty minutes, and while I was putting on my coat to leave, he reappeared, and with a lift of his hat came away. As he passed now his look was changed, and there was a beam of satisfaction in it, with a dash of sadness which set me all agog to know what it might mean.

I could only surmise, however, and wonder painfully how much it might concern the weal of Elsie. I was doing so at my fishing that night—for all taste for study had left me—when Henry came by with a spring in his step and a tune in his head, which he hummed gaily as he passed on his way to the mill. Some black-thorns screened me from the path, and I watched him till he disappeared behind the granary. The cherry orchard was beyond, and there Elsie, no doubt, was awaiting him. Here a fish gave a tug at the rod, and I landed a perch. I threw the line out anew, but couldn't keep still, through thinking of the tryst in the orchard; so I put up the tackle and went home.

Next day about two the Nemeton 'bus, instead of passing straight on, turned up the lane to the vicarage. It drove by presently with the two St Johns in it, and on its roof were three trunks marked in big white letters, 'H. ST J.' Jem had been repairing the millwheel since the morning, and crossed the road as the 'bus turned the corner.

'Sunmat wrong wi' young Missie this marnin', guv'nor,' said he. 'Her passed down brook-side just now, wi' t' collie, white as a daisy, an' arl red about the eyes, as if her'd bin cryin'. Th' old ledly's arl right too. Thought perhaps her'd had another fit and frightened the gell. That wheel o' theirs won't turn much longer, I'm thinkin'—it's gone reg'lar rotten, it has. Seems to me there ain't too much money movin' there, Mester Crannock.'

I went on with my planing, whistling a lame tune to myself, till, as thought joined thought, and one thing fitted into another, like mortise and tenon, my bile got the better of me, and I threw the plane down, telling Jem to jump into the sawpit. When we had done, and made lengths of a good-sized tree, Jem climbed out and wiped his face with a slow stare at me, which set me smiling; for quietness had come to me, and after three hours' distilling of it, I had found a soul of good in the evil that had happened. I told Jem to go home, and soon after went myself, and sat up till twelve o'clock that night book-reading.

Then I walked out in the stillness, and yielding to the inward pulling I could feel, went over to the millhouse, and gazed up at the little leaded

window of the room where Elsie had slept from a little one. I mounted the stile of the croft, and, under a tree-shadow which the moon made, sat listening to the weir, and castle-building on the ruins of her lost happiness. A little click came athwart it all, and I could see the casement swing outwards, and there was Elsie among the ivy, her hair all loose, and falling in brown waves on the whiteness of her bed dress. But her face was as white as it, as she looked up at the moon, her eyes glistening in its light like two dewdrops on a jonquil. There was a distraught eerie look in them which gave me an inward aching that she should take it so hard. Then she leaned her chin on her hands and gazed straight before her with a set stare. Presently her thoughts moved her lips, and became sounds in the stillness.

The broken sentences would look nothing on paper; nor is it for me to write down the doings of a maiden's soul when it comes forth in the solitude, thinking no one nigh to hear its soft plaints and its moanings. But as I listened, my head bowed, and my hope died away that I could ever turn such love to me, now that its tendrils had so wound round another's image. As well ask the brook to flow back from the river, or the flowers to look away from the sun in the morning. A cloud came between us and the moon, and when it had passed, Elsie's face was no longer in the ivy.

CHAPTER III.

But time brings its own heart-case to those who will submit to its healing, and not nurse their wound as some mothers do dead babes. It went hard with Elsie for some months, as I could tell by the looks of her; but gradually her sick-visiting—to which she had turned, as sore hearts will—brought peace to her, and some of the roundness of feature which she had lost. The life took her out of herself, and gave play to all that was finest in her nature; so that, as time went on and she ripened to fuller womanhood, the beauty she had become less physical, and more the expression of a fine spirituality. It was not saintliness exactly—though Farmer Waghorn said she was an angel in woman's gear—for it was something her violin and her reading had given her as much as her good-doing. She was in that state when love and renunciation, working together, force the soul into sight of higher issues, towards which it grows because it must, or faint. I didn't think it then, but I do now.

I was one of those who shared in this larger life, though for a long time I felt that I was no more to her, as we walked together from church, or met on the brook-side, than any other son of Adam with whom she exchanged words as neighbourly. But gradually she became more careless of the reserve behind which worked her inner nature, and we grew more visible one to the other, though I strove always to hide my secret for fear of frightening her off, and she said nothing of hers, appearing seldom to think of it but only of what we talked on.

Then hope grew big within me; and I worked on with a will and a good heart, careless of the meaning in her great wistful eyes, or of the weird throbbing melodies which came sometimes

from her violin as she played in the twilight across the soft murmur of the weir.

She was playing so one June evening as I lingered by the granary on my way to the brook-side—which was my favourite walk, because, perhaps, it was hers—when Dobson, the mill foreman, joined me. Something in his face made me look again at him.

'Some strange talk at "Crown" to-night, Garge,' said he, walking on beside me with eyes straight in front of him.

'Do they all look as sour as you on it?' I asked, ill-humouredly, for I wanted to be alone just then.

'Look sour, do I?—Well, I ain't that: I'm downright sorry, lad. One o' Lawyer Sharp's men is there, half-seas over, an' he's let it arl out. There's goin' to be a meetin' o' creditors. It's Higgins's doin'—the corn factor. He put in a writ; an' the others got wind of it, an' they arl swooped down like a lot o' kites on a lame sparrer. If he'd on'y bided his time a bit, there'd a' bin no harm done: there's plenty o' money out, on'y it's a bit tight.'

I stood still in surprise, and he stopped too, and across the momentary silence came the wail of Elsie's fiddle.

'Do you mean that there's money enough out to pay all debts?' said I, stepping on again.

'I'm pretty sure on't,' said Dobson. 'Higgins on'y did it 'cos her refused to give him a bill o' sale on the mill. He's had his wall eyes on th' old place these ten years or more. He's for pushing things to bankruptcy now, so as he may buy it up and run it hisself. Rawlins thinks so, and so do I.'

Rawlins was Mrs Onslow's clerk and manager, and I asked Dobson where he was. He told me, and I sought him out. Half an hour later I was in Mrs Onslow's parlour. She rose, in her quiet lady-like way, with some surprise in her face, which always had in it the half-dazed look of a confirmed epileptic. Saying nothing of what I had heard, I asked her at once whether I might put four hundred pounds in the business—three-fourths payable at once, and the remainder in a month. Higgins's debt was two hundred and sixty pounds. I watched her closely while the offer worked its way well into her mind. She was a proud woman, and unwilling to state how things were. At last she said—and I remember the shake in her voice—that she would accept the offer subject to her and my lawyer's approval, after conferring together on the value of the business.

'That'll be all right, ma'am,' said I heartily. 'I'll go to Nemoton in the morning and see the pair of them. Maybe you'd like to send some written instructions by me.'

She took the hint, and started to write a line or two to Mr Sharp; but seeing her hand was unsteady and something trickle down on to the paper, I took my leave hastily, saying I would call again in an hour's time. I did so; and Elsie and her mother were there together, waiting with glad faces to see me. It was the happiest night of my life; and when sleeping-time came, I hardly got a wink through thinking of Elsie's smiles, and the kiss of her hand she allowed me to take when I held it in mine for the parting.

The upshot was that Higgins was paid, and the other creditors argued into good sense at a private meeting we called. And when the mill-wheel had turned another three months or so things were all safe again, and I—I was engaged to Elsie.

Ay, it is true; and I was the blithest man in Norton Priors or anywhere thereabouts. How it happened would take too long to tell, and, moreover, I have little heart to do it, as I look back now and recall the foolishness of my Paradise. It was nothing else; for all the while it was not me she loved at all, but Henry St John, who had taken orders, and avowed himself a celibate, as some do. But she had given him up, as I well knew; and there was enough affection in her manner to make me believe that I had won my way into her heart, and not only into its vestibule. She was a gentle loving thing to all about her; and I believe now that she took me only out of kindness, seeing me so far gone that she hadn't the courage to say nay to my pleading. Then Mrs Onslow helped it along, having taken a fancy to me, and seeing in the match, perhaps, good likelihood of happiness to Elsie. I was to go and live at the mill-house, and after a time to leave off wheelwrighting and manage the business, Rawlins having grown a bit old and 'dotty,' as we said in our parts. And so it was planned out, and love shone all about it, and I was no more capable of seeing spot or blur in the picture than the sun is of seeing darkness. Yet it was only a vision and a vain thing.

SOME NEW ZEALAND PECULIARITIES.

For so small a country it is remarkable what a variety of climates New Zealand presents, and how gradually the one merges into the other. In the extreme south—say in Stewart Island, or round Invercargill—we have the four seasons, in one of which the enthusiastic Scot may even enjoy 'the Roaring Game.' But as one proceeds northwards the climate becomes gradually milder and milder, until, in the district around the Bay of Islands, we have an almost tropical climate, with only two seasons—dry and rainy—no snow, no frost, but a land for the orange and citron, the banana and the guava. Yet all this variety falls within a very limited range of temperature. There are no extremes; and, in truth, winter is a name rather than a reality for all the North Island and the South Island too. The cause of this tempered climate is due to its configuration and position. It resembles Italy in shape—long and very narrow; stretching north and south a length of eleven hundred miles; whilst its extreme breadth is no more than one hundred and forty miles. To project such a country in the northern hemisphere, it would stretch, say, from the centre of France over Spain and the Mediterranean into the middle of Morocco. On account of its narrowness, no part is distant more than seventy-five miles from the sea; and it lies out far in the bosom of the Pacific Ocean.

The ocean swell that ceaselessly dashes itself against the east coast can travel with an unbroken course more than four thousand miles from the coast of South America; while on the

west side Australia is the nearest mass of land—twelve hundred miles off. It is therefore essentially a maritime country, and it is this surrounding expanse of water that tempers so delightfully its climate and supplies it with such abundant moisture, that it compares favourably with Australia, where often man and beast languish under the sweltering, scorching heat and long droughts that dry up vegetation until it is ready to fall into dust. It is never blighted by land-winds such as blow from Africa upon Italy, or even from the Continent upon Great Britain. It is pre-eminently a land of coolness and greenness, where grass and bush all the year round wear a living vivid green. So mild and equable a climate as this allows the colonials, one might say, to live an outdoor life. Even in the night-time they can scarcely be said to be confined, as open windows and the slight framework of their wooden houses give free access to fresh air.

Nowhere can one obtain more beneficial conditions for maintaining or recovering health. The tables of flourishing life-insurance companies attest this general healthiness, and a story widely reported illustrates it. A judge of a rather testy but withal humorous disposition, who had presided over a large district in Otago for seventeen years, was asked by official authorities to make out certain returns about the mortality of the district. His answer was that there was no death-rate for his district, for during the past seventeen years there had occurred only two deaths, and these were of strangers, one of whom was murdered, and the other hanged for the murder.

This isolated position of New Zealand has, however, this manifest disadvantage, that the colonist has to go far to find a market for his produce. Yet science has to a great extent bridged this difficulty, and enables him to compete profitably in the home-market. Its application to practical purposes has no more remarkable instance than the process of refrigeration applied to preserving meat. All the mail steamers are now fitted up with chambers which can hold from twenty to thirty thousand carcasses. The Gear Freezing Company allowed for a small sum—less than one pound—the privilege of sending a frozen carcass to one's home-friends. It was greatly taken advantage of, particularly at Christmas time, so as to provide the Christmas dinner with the novelty of 'lamb' instead of the ordinary turkey.

Again, this complete isolation of New Zealand affords undoubtedly an explanation of many of its peculiarities in animal and plant life. No animal of the larger type is found in New Zealand. Indeed, the only native quadruped—and even that is doubtful—is a small rat called 'kiori' by the Maoris. This rat and two kinds of bats are the only representatives of land mammals. On the other hand, there are a good many kinds of moths, butterflies, and gnats, but only two insects. It teems with such life on the borders of the bush. The writer well remembers how one hot summer evening, when the windows were thrown open, the moth tribe thronging in, heaped themselves upon the light until it was stifled—a holocaust celebrated by the trumpeting 'ping' of half-a-dozen mosquitoes. The only other active and therefore vicious insect beside

the mosquito is the sandfly; but its activity is confined to the daytime.

Native birds are very interesting, though, like the Maoris themselves, they are becoming rarer and rarer. The moa is already supposed to be extinct, and we know it only from its vast skeleton and egg, to be seen in the colonial museums. There are, however, still existing two birds of the moa kind, though on a diminutive scale: these are the weka and kiwi—both provided with only the most rudimentary form of wings. The weka is an intensely curious bird, with more oddities and greater knowingness than even Barnaby Rudge's raven. But the best loved of all is the 'tui.' Once one has heard its clear liquid bell-tones, on the fall and rise of which one's very soul hangs, it will never be forgotten. Young New Zealand calls it the 'Parson Bird,' by reason of the white spot on its breast, representing, as it were, the cleric choker. Besides these, there are a few varieties of hawk and parrot kind.

Its reptiles are confined to a few varieties of the lizard, and these are quite harmless, although held in great terror by the Maoris. Among all these animals there is no one dangerous to man. Perhaps exception should be made in the case of the katipo, a small dark spider with a red spot, the bite of which is said to be highly venomous. It is very rare, and we never had the satisfaction of falling in with it.

But surely the most curious of all objects is that which the Maoris call 'aweto.' One is uncertain whether to call it an animal or a plant. In the first stage of its existence it is simply a caterpillar about three or four inches in length, and always found in connection with the rata tree, a kind of flowering myrtle. It appears that when it reaches full growth, it buries itself two or three inches underground, where, instead of undergoing the ordinary chrysalis process, it becomes gradually transformed into a plant, which exactly fills the body, and shoots up at the neck to a height of eight or ten inches. This plant resembles in appearance a diminutive bulrush; and the two, animal and plant, are always found inseparable. One is apt to relegate it to the domain of imagination, among dragons and mermaids; but then its existence and nature have been accepted by the late Frank Buckland. How it propagates its species is a mystery. One traveller, after describing its dual nature, calmly states that it is the grub of the night butterfly. If so, then the grub must also become a butterfly, or what becomes of the species? One would be ready to suppose that the grub does really so, and that some fungus finds the cast-off slough congenial quarters for its growth. But as far as present observation, the grub never becomes a butterfly, but is changed in every case into a plant.

This singular deficiency in animal economy furnishes the Maoris with a plausible excuse for their past cannibalistic practices. We must suppose that the absence is due to the isolation of these islands, for there are no natural conditions antagonistic to animal life. On the contrary, nowhere has acclimatisation been so successful as in New Zealand. All kinds of animals from the house-fly up to the horse have been introduced, and have flourished and multiplied in an almost miraculous manner. Early settlers

tell us that the few pigs set loose by Captain Cook at Gisborne had increased to such an extent as to overrun the whole of the North Island, and were eagerly hunted by the Maoris. It is well known how the country's permanent prosperity depends upon its unique adaptability for raising the sheep, cow, and horse. You can now get a good riding hack for three or four pounds.

All home birds are quite common—too common for the farmer's liking. Though most of the rivers have been stocked with trout, there has been a hitch in the introduction of the salmon. The ova are hatched, and the young fry, full of vigour and life, make their way to the sea; but they never return. What becomes of them is uncertain.

The bee has had a wonderful history. The whole country swarms with them; yet, according to Mr Froude's account, they are all the offspring of two hives taken out by Cotton of Christchurch. It is told that he was accustomed to keep them in his sitting-room, and they had become so attached and familiar with his person, that a squad of them used to attend him at lectures and chapel. However this may be, we know from personal experience that the rate at which they multiply is marvellous. In a township of Wellington, a colonist had got a chance swarm about the beginning of the season, and by the end he had several swarms from this single hive. In the following season they simply poured forth until all available boxes and barrels about the steading were exhausted, and then swarm after swarm was allowed to take flight. These would find a habitat in the bush, which is rapidly becoming as rich in stores of honey as the prairies and backwoods of America. Indeed, bee-hunting would be quite profitable, were not honey so plentiful and cheap.

The acclimatisation of animals in New Zealand has not been without some curious changes in the structure and habits. All of them seem to breed oftener and to attain a much larger size. The average weight of the sheep is sixty-eight pounds, double that of the home-sheep, and its fleece is twice as large. Trout are often caught more than thirty pounds, and they seem to take as well to sea-water as to fresh. Many birds that lived on insects in the home-country have become quite destructive to the colonist's crops. The lark here often sings during the night, and has become so indolent that it perches upon the fence whilst it sings. This change of natural instinct has been shown in a curious manner in the case of the kea, a native bird. It is a common parrot, green and brown in colour, and, until some years ago, a strict vegetarian. All at once it developed a strong taste for the fat that surrounds the sheep's kidneys. It attacks the live animal, and tearing open with its strong bill the side of the helpless sheep, it gorges itself, and then leaves the animal to die.

The glory of New Zealand is not its hot springs, with terraces; not the wild and weird scenery of its sounds and highlands. These are certainly grand; but the unique wonder is its 'bush.' And, reader, if you desire to behold this wonder, you must make haste, for fire and axe are making sad havoc, and in a few years naught will be left but unsightly charred stumps. But let us hope at least that ere its disappearance

some poet will arise to sing its grandeur and beauty, and to give articulation to the mysterious sighs and sounds that issue from its depths. Take your stand upon this grassy hillock, that has long ago been cleared; and, lifting your eyes northward, you behold a sea of foliage with no very bright colours, but dark, cool, and vividly green. Starting from the bottom of the hillock, it surges onwards until, some leagues away, it beats against a hill-range; but this forms no barrier to its onward progress, for its heights are sealed; and this forest, I may tell you, unbroken save by a small clearing called Norsewood, a Scandinavian settlement, merges into what is termed 'the Forty Mile Bush'—a piece of bushland well known to stagecoach travellers. This bush is quite unlike that of Australia. It is Australian bush plus a dense jungle impervious to wind and sunshine. Mighty pines of many kinds, the rata, totara, rimu, and others, raise aloft their heads from one to two hundred feet. The space between their trunks is closely packed by festoons of creeping plants, wild vines, supplejacks, and other parasitic vegetation. There, too, you see the graceful fern-trees raising aloft their slender dark stems from twenty to forty feet; you see the long sword-blade leaves of the nikau, the only palm of New Zealand; and most beautiful of all, and certainly the most characteristic feature of New Zealand forest-land, the tuft-topped cabbage-tree. These three plants give a peculiar tropical look to New Zealand scenery, and at once impress the immigrant with the remembrance how he is in a strange and distant land—a fact which otherwise one is apt to forget in New Zealand.

Now turn and look southwards. What a different scene! Naught but a waste of charred stump and blackened trunks, with here and there a tree standing, grimly raising its blasted arms to the heavens, as it were in condemnation of man's desecration and vandalism. A more desolate and disheartening sight one can nowhere see! Yes; that is what the settler accomplishes with his two instruments—axe and fire. But you may be assured that he looks upon the scene from a far different point of view, and not without cause, because it is a herculean toil to attack that impenetrable bush, and requires a stout heart with a vast amount of energy and hopefulness to carry the clearing operation to a successful issue. The bush-feller is full of expedients to lessen his labour. He makes use, for instance, of the larger trees to knock over others in their vicinity half cut through; and then he attacks the tree, not at the root, but as high as he can reach, so that stumps four or five feet in height are left. When the felled timber is thoroughly dry, he sets fire to it; and if he gets a successful 'burn,' when the rain comes on he sows his grass seed, and in a few days the tender grass springs up in a marvellous way out of the fertilising ashes, and by the end of winter his land is ready to be 'stocked.' The bush-land once cleared, compensates him for his toil and hardship. He has secured a present competence and an ample field for the employment of his family, however numerous. Then each year adds to the value of his property.

In the best of communities there is always found more than a sufficiency of black-sheep, and

New Zealand is no exception. But there has recently been a great diminution in the number of criminal offences, so much so, that many are quite sanguine that crime shall die out altogether or become very rare. The most thoughtful ascribe this result to the influence of their thorough educational system. The experiment of a 'First Offenders Act' was first tried in New Zealand, and though laughed and jeered at as a piece of absurdity and sentimentalism, its results, both from an economic and moral point of view, have been highly satisfactory, and now the mother-country is following in the footsteps of her child. Occasionally, indeed, a Cassandra voice is heard denouncing the rowdyism, or, as they style it, the 'larrikinism,' that is becoming more and more prevalent throughout the country. The young colonist, overfed on meat and 'flown with insolence' and high spirits, if not with wine, is apt to become a source of annoyance to his neighbour and to those who come in contact with him; but for the most part these irrepressible high spirits of his find an outlet in the more violent form of recreation, such as football, rowing, horse-racing, and the like.

New Zealand is the workman's paradise, where the four eights, so longed for by radical reformers, are a realised fact. It does not, on the other hand, present many facilities for making a fortune; nor do the colonists desire to have amongst them millionaires or billionaires; but what they want is steady progress without poverty; and let us hope that they may have it. It is true that that crying evil of modern civilisation, centralisation, has already begun to show its evil effects in 'the four colonial cities.' Men will cling to the town, preferring the enjoyments of the bar and cheap theatre to solid independence up the country. Politicians and municipal authorities encourage the evil by finding employment for these 'loafers.' We remember seeing a squad of these so-called unemployed in Dunedin. They were getting four shillings and sixpence a day, and it was currently reported that they were going out on strike for an increase. Yet the country is simply crying out for an able-bodied class, either as occupiers of their own land or as hired labourers; for it is the men who can wield the pick and shovel that have the ball at their feet.

PURVEYANCE.

EVERY year, on the anniversary of the birthday of the Prince of Wales, a gathering of some two hundred of the 'Royal Warrant-holders' takes place at one of the principal London restaurants, in order to loyally celebrate the happy event. Such a gathering together of those who enjoy the privilege of holding the 'Royal Warrant of Purveyance' affords a striking contrast to the condition of things which existed, in regard to the purveyance of the royal household, prior to the period of Charles II., in whose reign the old and pernicious system of purveyance received its death-blow.

Purveyance, or 'pourveyance' as it was termed in the middle ages, signifies the providing of necessaries for the sovereign and his or her family

by buying the commodities at an appraised value in preference to all others, and even without the owners' consent. To trace its origin is no easy task. Suffice it to say that there may be found many biblical references to a system of 'tribute,' an operation which would seem to have a somewhat close connection with purveyance; an organisation introduced, no doubt, by the Romans, and so handed down to their successors. The subject affords but little interest until the reign of Edward III. is reached. An amusing incident, however, occurring as far back as the reign of King Edgar, as told by Chauncey in his *History of Herts*, is retold here in order to show the cunning practices resorted to by royalty in those early days.

It would seem that, except by special charter, the inmates of the monasteries, in common with the rest of the king's subjects, were not exempt from purveyance; thus, they were frequently liable to the visits of royalty and its retinue, such visits being considered as part of the system of purveyance. The Abbey of St Albans had, we are told, a large lake adjoining it, to which the king, with his no small troop of retainers, made frequent visits for the purpose of fishing. After satisfying themselves with sport, the king and his followers invariably made themselves the guests of the Abbey. These frequent visits becoming inconvenient to the inmates of the Abbey, the wily Abbot, in order to rid himself of such troublesome guests, adopted the plan of draining the pool, under the pretence of extending the Abbey, which from that time forth had no attraction for royalty.

To return to the period of Edward III. We find the office of purveyor to have been one exercised with much oppression, so much so, indeed, as to necessitate continual applications to the king for redress, and, as a result, the passing of numerous Acts of Parliament to restrain the abuses complained of. We are told that, as a response to some of the appeals, he changed the title of the much-abused office to that of *Acheteur*, or buyer. The new title does not appear to have lasted very long, nor does it in itself seem to have been a remedy for the evils that existed; but the change was followed by a certain amount of reform—that is to say, regulations were framed by which one of the king's household was appointed to inquire into the conduct of the *acheteurs*; and if they took more than they delivered into the royal larder, and did not pay for what they received—errors not infrequently committed—from the people, they were to forfeit their lives.

Burke, in a speech in Parliament on the proposed reformation of the king's household, seems to have had a pretty clear conception of the character of these officers, whom he described as 'sallying forth under the Gothic portcullis to purchase provisions with power and prerogative, instead of money, inspiring terror, and finding a flying and hiding country.' These officers not only had power to raise food for the royal household, but the carriages and horses of the subject, however inconvenient it might be to the owner, were likewise liable to be impressed into the king's service at a 'fixed price.' Even the ships of merchants arriving in port laden with wine were not exempt from visits of the king's pur-

veyor. We are told also that this officer had the right of choosing two hogsheads of wine—no doubt he chose the best—for a payment of twenty shillings for each, with the option of taking more if he chose at an appraised value. A fishmonger pursuing his trade in this reign was precluded, by royal command, from going out of the City of London to purchase fish until the king's purveyor should have first made his purveyance for the king.

Such was the condition of things in the years of Edward III.'s reign, in which many Acts were passed with the view of relieving the oppressed people from the rapacity and extortion of the 'purveyors' or 'acheteurs,' but to little purpose. Until Elizabeth's reign little or no change took place in the condition of things under which the people suffered. Then it was that the royal authority was exerted by the hanging of one of her purveyors for having forcibly taken provisions without paying for them. Notwithstanding this salutary example, the purveyors still gave trouble to her subjects by withholding the money due to them for goods supplied; causing them at last to petition the Queen that she would accept the value of goods in money, that is to say by means of a composition. This, at first, she would not assent to; but after some hesitation an agreement was arrived at as to what proportion of goods each county should supply. Hence compositions in each county were made by the Justices of the Peace for serving a certain quantity of provisions at rates fixed by them in consultation with the officers of the royal household; the difference between the price fixed by the justices and the market value being raised by an assessment on the whole county and paid to the owners of the goods. As an indication of how far below the market value were the royal or justices' prices, the following table is given of an assessment made in Middlesex:

		Royal Prices.	Market Prices.
		s. d.	£ s. d.
Wheat.....	200 qrs. at	6 8	2 0 0
Veals.....	40 qrs. at	12 0	1 2 0
".....	100 qrs. at	6 8	1 2 0
Greene Geese.....	10 doz. at	3 0	1 8 0
Capons.....	10 doz. at	4 0	0 16 0
Hens.....	20 doz. at	1 6	0 12 0
Pullets.....	20 doz. at	1 6	0 10 0
Chickens.....	40 doz. at	2 0	0 6 0
Hay.....	200 loads at	4 0	1 10 0
Oats.....	211 qrs. at	4 0	0 12 0
Litter.....	180 loads at	4 0	0 10 0
Wood.....	200 loads at	3 0	7 0 0

—the difference on the whole being in favour of royalty to the extent of nearly one thousand pounds. By this method of taxation, though falling somewhat heavily on the county, those serving the royal household received the market price for their goods, less the proportionate difference between the royal and market prices, which they, in common with their neighbours, were called upon to pay by way of assessment; besides which they were relieved of the personal presence of the obnoxious royal purveyors, the duty of raising the provisions required by the royal household, from that time forth, devolving upon the High Constables.

In the following reign, however, as most readers of history are aware, the unhappy system of purveyance, with its attendant evils, was com-

pletely abolished; in consideration of which, Parliament settled upon the 'Merrie Monarch' the hereditary excise of fifteenpence per barrel on beers sold in the kingdom, and a proportionate sum on all other liquors.

No doubt, in the times when the court moved very frequently from one place to another, as it was accustomed to do, when markets were few and provisions not so abundant as now, an honest system of purveyance was a necessity; but in these days of luxury and convenience, so far from the abolition of the old mode of purveyance being a matter for regret, the contrary is the case: the people, instead of, as in days gone by, fleeing at the approach of royalty, now welcome it, and none more so perhaps than the fortunate 'Royal Warrant-holders.'

AN INCIDENT IN THE WILD WEST.

THE story which we are going to relate has nothing to do with cowboys on the sprec, or any of those shooting affairs in drinking saloons of which we hear from time to time, and which are, unfortunately, still common enough in the Wild West, but has to do entirely with the widely prevailing custom of punishing criminals by lynch-law, instead of waiting for the proper authorities to carry out their duties. Possibly many people in this country suppose that lynch-law—that is, the taking of the law into their own hands by the dwellers in Western settlements—is only resorted to when there are no constituted authorities at hand to carry it out. We shall show that it is frequently put in action even after the State itself has already begun to move in the matter; and that, consequently, instead of being practised because there is no other law in existence, lynch-law and the State sometimes come into conflict in such a way as to tend to additional bloodshed.

The scene is the little town of Graham, situated about a hundred miles from the State capital, and not far from the Rio Brazos, which flows through the centre of the enormous State of Texas, the largest of all the United States. Although Graham is but a small place of some six hundred inhabitants, it is the chief town of Young County, and is dignified, according to Western usage, by the name of a city. In the centre of the town stands the jail, a plain square building, whose barred windows look right into the public open space around, so that the prisoners within can, if they choose, hold conversation with their friends outside. We need not speak of the interior of the jail, for the events which we are going to describe happened chiefly without its walls.

In the month of December 1888, four brothers named Marlow were imprisoned in this jail on a charge of horse-stealing. There were five brothers altogether, and their home, a rough shanty, was situated four or five miles outside Graham. They bore an indifferent character, and were commonly known as 'Those Marlow Boys.' The sheriff of the county at the time was one Marion Wallis, a much respected citizen and official. A sheriff in an American county may be described as a combination of jail-keeper and policeman, and occupies something of the position of a superintendent who has charge of a lock-up

and police division in one of our English counties. A few days before Christmas, the Marlows were released from prison on bail. They had hardly left the jail before Sheriff Wallis received a warrant to arrest them on a charge of murder. Wallis was a kind-hearted man, and he determined not to execute the warrant at once. He would let the men have, he said, one day to see their old mother and their wives. The next day he went, accompanied by his under-sheriff, one Collier, to the home of the Marlow Boys. It was about mid-day, and they were seated round the dinner-table.

'How d'ye, Wallis?' said one of them. 'Come and have a snack.'

'Don't mind if I do; believe I will,' replied the sheriff. He turned to the door and beckoned to Collier. No sooner had he turned, than one of the men seized a Winchester rifle which was ready to his hand and shot him through the back. Collier, seeing his chief fall, made for his six-shooter, which was in the saddle pouch on his horse outside the door.

'Hie, Collier!' cried the Marlows, 'put down that six-shooter, and you may come and attend to Wallis; but if you don't drop it at once, you're a dead man.'

Collier had already had a narrow escape, and accordingly he concluded to drop his weapon, and the murderers fled from the hut.

He procured assistance, and carried Wallis back to Graham. The poor man lingered for a few days; on Christmas Day he died. During the whole of the short time that he continued to live, he was wandering and delirious, now calling out, 'Do not hurt the Marlow Boys,' and now imagining that he was tracking his own murderers through the scrub. The men had not gone far from their home, with the exception of one who had jumped on to a horse. Citizens had gone out on the night of the day on which Wallis had been shot, and had brought four of the brothers to Graham, and lodged them in the jail again, amidst the yells of the inhabitants, with whom poor Wallis was very popular. It must be remembered he was not yet dead, or something might have been done that night. When, however, it was known that Wallis was dying, the populace was aroused. On Christmas Eve an attack was made on the jail. It was but a half-hearted one, for, though the gate was burst open, the Marlows armed themselves with iron bars, and threatened to strike down the first man who entered. The under-sheriff managed to secure the jail again, and no further attack was made on the building.

Wallis was buried on New-year's Day, the whole population of the town attending his funeral. By the middle of January it was known that the Marlows were to be moved to the town of Dallas, either for more safe custody, or that they might stand their trial there. Dallas is about fifty miles from Graham, and some of the Grahamites had determined that, if they could prevent it, the prisoners should not reach Dallas alive. At dead of night an official sent from Dallas proceeded to remove the prisoners. He had the four brothers chained two and two by their feet, and they were placed in a sort of van, called a 'hack,' together with two other prisoners. No armed men rode with them, for fear, it was said, that their weapons might be wrested from

them by the desperate Marlows; but some men who had been engaged for the purpose, rode, armed with Winchesters and revolvers, in another hack behind. The road led through a ravine just outside the town. This ravine had been lined on each side by a gang of masked citizens, who fired down indiscriminately on the party below. The wagons stopped. The Marlows jumped out, ironed as they were, and wrenched some of the weapons from their assailants. The night was pitch-dark. The shooting was wild and furious in the midst of the confused crowd. It was never known exactly by whom the many fatal shots were fired in that terrible darkness. Two of the Marlows fell dead, and so did three of the citizens. Many others, both of the prisoners and of the attacking party, were wounded. The guard in the second hack were but of little use. One young man jumped off and ran back to the town in a fright; the others were useless either to keep off the mob or to secure the prisoners. The two surviving Marlow boys jumped on to one of the hacks in company with one of the other prisoners, and drove home through the streets of Graham shouting and singing. The inhabitants who had not taken part in the plot, aroused from their sleep, and warned of what had happened by the young man who had been the first to escape, made their way to the scene of action, and brought in the dead and wounded from the blood-stained road. The bodies were those of the two Marlows and of three citizens. When the masks were removed from the faces of the dead, their fellow-citizens were horrified to see what respectable and prominent inhabitants of the town had taken part in this lawless enterprise.

The Marlow survivors arrived at their shanty blood-stained and wounded. There they remained for some days. The townsfolk seemed to be completely cowed, for they allowed themselves to be kept off by the five women, wives and widows, who kept guard with Winchesters and revolvers over the hut where the wounded men lay. A doctor was admitted to attend to them; no other man dared to pass.

The United States Government now interposed in the matter; and after a few days, the Marlows gave themselves up to the officials, were taken off to Dallas, and then, strange to say, liberated on bail. One brother was still at large, the man who had ridden off on the day when Wallis was shot. He went by the name of Boom Marlow, and a reward was offered for him dead or alive. Some young men went out from Graham, tracked him, shot him, and brought in his body. The young men who did this found themselves, to their astonishment, arrested for murder, but were also, according to the prevailing custom, let out on bail. In the meanwhile, proceedings had been taken against the leaders of the night attack; but they were let out on bail as well. Seven lives had already been lost over this affair.

After a lapse of more than a twelvemonth the two Marlows were at last brought to trial, and, to the surprise of all who knew anything of the case, were acquitted of the murder of Marion Wallis. Of course the original charge of murder on which Wallis went to arrest them has been entirely lost sight of. As to the citizens who made the midnight attack, they are still out on

bail, and whether or not anything further will be done in their case, no one can say.

The inquiry naturally arises: Why do these exhibitions of mob violence take place? Why does not the law proceed in its ordinary course? We have been describing no isolated case. Such a state of things is only too common out West. Only about ten years ago a very similar case took place in Graham itself. Three men were arrested for a most cold-blooded murder. They had killed a man on his farm in the absence of his wife, and when the woman returned, told her that her husband had sold the farm to them, and had moved elsewhere. Well, these men were shot down as they were being conducted through the streets of Graham. They fell on the footway, perfectly riddled with bullets, one Sunday morning as the people were walking to their places of worship. The reason must be the strange uncertainty of the law, the uncalled-for delay, and the too ready granting of bail. So many red-handed murderers have got off in one way or another, that the criminal law has come to be regarded in certain districts with distrust, and the consequence is that Judge Lynch has taken its place. There is a sense of honour, however, amongst these assistants of Judge Lynch. They do not wish to be lawless, they say; they only want to carry out just retribution, which they fear may not come in any other way. For instance, in the second case which we have described a gunmaker's store was broken into, and the weapons and ammunition were seized for the attack on the murderers of the farmer. After all was over, every weapon was returned. The incident reminds one of the guinea left in the rope-maker's booth in Edinburgh in exchange for the rope taken thence for the hanging of 'Porteous,' as described in the 'Heart of Mid-Lothian.' The remedy for the evil is a more efficient police system, and what is far more important, the immediate trial of prisoners charged with murder, to be followed by their immediate, or at least not too tardy execution if found guilty. It is only in this way that any confidence or belief in the law can be implanted in the minds of the dwellers in the Wild West.

THE HISTORY OF NUGGET-FINDING.

THE history of the great Californian and other Nuggets of the precious metal is in many respects interesting and romantic. Thus, the discovery of one of the finest Californian nuggets was made under very singular circumstances. It is known as the Oliver Martin Nugget, and was found near Camp Corona, in Tuolumne County, and weighed 151 pounds 6 ounces. Martin and a companion named Flower were camped in a cañon, when a terrible rain-storm came on in the night, and the water in the stream suddenly rose. The miners attempted to climb the hill, but the flood overtook them, and both were carried down the stream. Flower was drowned; but Martin, though severely injured, escaped.

While trying to bury his companion's body by the roots of an upturned tree, Martin discovered the rich nugget that bears his name. He was too weak to move it. He attempted to reach some neighbouring miners, but fainted from

exhaustion, and was found on the trail by them. When able to walk, some weeks later, Martin took them to the spot, and the nugget was removed. The gold was mixed with quartz, but the nugget was valued at over twenty thousand dollars.

But the largest nugget ever found in California was discovered in November 1854, at Carson Hill, Calaveras County. It weighed 180 pounds. Another, weighing 149 pounds, was soon afterwards found at the same place.

In August 1869, W. A. Farish, A. Wood, J. Winstead, F. Clevers, and Harry Warner, were partners in the Monumental claim, near the Sierra Buttes, in Sierra County. During the last week in that month they discovered a huge nugget, which weighed 1593 ounces troy. It was sold to R. B. Woodward, of San Francisco, who paid 21,637 dollars for it for exhibition purposes. It was afterwards melted, and realised 17,655 dollars. Sierra is justly famed for the nuggets it has produced. It was in this county, at a spot known as French Ravine, that a nugget valued at twenty-three thousand dollars was found in 1850.

The biggest nugget of gold ever found in Shasta County was discovered in 1870. One day three Frenchmen, two of whom were named Oliver Longchamp and Fred Rochon, drove into the old town of Shasta in search of a spot to mine. They happened to have some business with A. Coleman, a dealer in hardware. The three asked him where was a good place to mine. He carelessly pointed in a northerly direction and said: 'Go over to Spring Creek.' They took his advice, located a claim on the creek about eight miles north of Redding, and in a few days one of the little party picked up a nugget worth sixteen thousand dollars.

Plumas County, though one of the richest mining districts in California, has yielded but few valuable nuggets. The largest was found by a Chinaman in 1861, and was sold for 9600 dollars. A miner named Archie Little found one in the same district that brought him 4906 dollars.

In Placer County, in 1859, Edward Gilbert, in a drift-mine near Butcher Ranch, about a dozen miles from Auburn, found a nugget of gold and quartz that weighed twenty pounds, which he disposed of for five thousand dollars. A little later on the same man discovered another valuable nugget. The gold was embedded in a mass of crystallised quartz with clear-cut corners, the sides of whose cubes shone with great brilliancy. He sold it for 6206 dollars.

In El Dorado County, at Spanish Dry Diggings, a nugget weighing 105 ounces was found in 1853, and sold for 1800 dollars. Another was found near Kelsey in the same county, and sold for 4700 dollars. In 1863 a mass of gold weighing 360 ounces was discovered at Columbus, in the same county, and was valued at 5236 dollars; and not far from the same spot, a poor Frenchman found a nugget valued at five thousand dollars. The rich mass of gold rendered the miner insane, and on the following day he had to be sent to the Stockton Asylum. The money was sent to his family in France. Near Knapp Ranch, in the same county, John Strain discovered a nugget that weighed 50 pounds. There was a large percentage of quartz in it, but the gold fetched 9500 dollars.

Near Magalia, in Butte County, on August 14, 1859, Ira A. Willard found a nugget weighing 54 pounds; and on the strength of his find, he and his companions held a grand drinking bout.

The largest nugget ever found in North Carolina weighed 80 pounds. The largest ever found in Siberia weighed 96 pounds 4 ounces; while the heaviest nugget of gold ever found in the world was found in Australia in 1852. It weighed 223 pounds, and was known as the Water Moon Nugget.

A curious fact in connection with gold-finding has just come to light in the United States. George Nay, an old Colorado miner, asserts that he has at last found the Mojave Mine, one of the famous lost gold mines of the desert, whose existence has been unknown for nearly thirty years. This mine was notable among the Mojave and Hualapai Indians for a long time before the arrival of white men. The Mojaves used to bring the gold out and trade with it along the Colorado River. The location could not be found, however, as Arataba, the old chief of the Mojaves, kept it a secret. Many whites have hunted for the mine since the death of Arataba, which took place about twenty years ago, and Nay now claims that he has discovered the location of the mine. He says it is twenty miles over the Colorado River, in Arizona, and on the edge of the Sugar Loaf Mountain. He has discovered distinct traces of the old Mojave workings, and has gone to San Francisco for the purpose of forming a company. If he is not mistaken, the United States may once more become the scene of nugget-finding.

DREAM-LAND.

THOUGH the years be fled, and the pain is dead,
And the grief is over long,
Yet on Dream-land track doth the soul go back,
And lo! the sound of a song,
That rings from a glade where the trees are green,
Where the wind of sorrow never hath been!

And out of the night come back to sight
The forms and faces of yore,
The old love wakes, and the old joy takes
Colour and light once more;
There sounds a voice we can never hear,
A step that has left us for many a year.

The sunbeams creep over eyes that sleep,
And we wake with a start to know
That in fair dream-land we have clasped a hand
Which held ours—long ago!
And we thrill to a touch that is lingering yet
To a passion of love, and of vain regret.

And for many a day we wend our way
The unseen world around us,
For the soul has snapped the chain that wrapped
The earthly links that bound us,
And the workaday world around us seems
Less real by far than the land of dreams.

POMONA.*

BY THE AUTHOR OF 'LADDIE,' 'TIP CAT,' 'LIL,' &c.

THE PROLOGUE.

THERE was an apple-tree in full bloom the day the child was born, and that was why she was called Pomona. Her father, Owen Ludlow, had retired from the agitation prevailing in the bright, little house that still bore the marks of the newly married plainly about it, for his wedding day was barely a year ago, and had betaken himself to the small room that was called his studio, and had nearly spoilt a pretty sketch on his easel by an unaccountable unsteadiness in his hand, and so had given up the attempt, and had stood looking out at the window, imagining that he was taking artistic stock of the pink and white glories of the tree outside, and of the sunshine dappling the green moss on its trunk, and of the cluster of white narcissus underneath. Really, he was quite unconscious of what he was looking at, all his senses being concentrated in the next room with his young wife; but, all the same, that day was inseparably connected in his mind with apple blossom, and apple blossom with that day, as also the long soft note of a nightingale, which was interrupted by a knock at the door and the entrance of the doctor to announce that he was the father of a little girl. Whenever he heard that long note in years to come, he listened also involuntarily for the knock at the door and the old doctor's voice.

A few days later the blossom was falling softly on the mossy path and the box-edging, when Owen Ludlow went out to pick some of those white narcissus to put in his dead wife's hand. It was very sad. There was the greatest sympathy bestowed on the young widower, whose honeymoon was hardly over, whose wedding presents were still almost intact, time and housemaids'

dusters not having yet wrought their usual work of devastation. In the wardrobe, that still opened stiffly from newness, hung the pretty trousseau dresses, some of them hardly worn; and there were yet unexplored corners in the hearts both of husband and wife, feelings unknown to each other, sympathies untasted, antipathies—who can tell?—untouched on; hundreds of circumstances in which one had not seen the other, and could have no idea how he or she would act. For example, she had never seen him in the exasperating circumstances of spring-cleaning, the newly-married house being all spick and span when they came into it last May, and the general upheaval and convulsion, that comes with the spring-time into all well-regulated households, having been postponed till after Pomona's arrival. It is not easy to find an equivalent situation of trial in which Owen Ludlow might have seen his wife; but undoubtedly during the first few years of married life there must be continual surprises, and new lights thrown on character and conduct, which may be pleasing or the reverse.

Well, sad as it was to lose all the sweet possibilities, it must be taken into account that they escaped all the bitter as well; and it was something to part without a single breath to ruffle the course of the stream of true love, over which the honeymoon shone so brightly to the very end. A sorrow that is quite free from remorse is almost a happiness when the first anguish is over.

But it was not to be expected that Owen Ludlow should feel this that first evening, when the room above was empty with that emptiness only a funeral can leave, and the mournful, little

party of guests had departed, and he sat in the dining-room, that was pervaded with the sickly smell of black gloves and funeral flowers, and tried to re-arrange his life's programme. His wife's work-basket was still on the little table in the window, with the needle stuck into the baby's shirt she had been hemming not a fortnight ago. The basket itself had been a wedding present from some school-girl friend, and each little working implement had some pleasant association to the young wife. Owen felt, even in his own great grief, a little extra, pitiful feeling for all these simple associations snapped so abruptly. Who would remember now if Bessie or Rose had given the small thimble, or how little Dolly made that pincushion with her own hands? He put them all almost tenderly away, as if they, too, could feel their bereavement; and he was quite glad of the trifling occupation to distract him for a moment from the distasteful task of making up his mind as regarded the future.

There was the baby to be thought of—Pomona. He had quite made up his mind that she should be called Pomona, though the old nurse had declared it to be an outlandish name, and 'Why shouldn't she be called after her poor dear Ma?' Not that, of all other names; it would have been sacrilege to him to call any one Katharine Ludlow—above all, such an odd, little, red object as the nurse had exhibited with pride; just as it was an insult to pretend to find a likeness between mother and child, as the servants always did in very audible tones when they thought he was within hearing. And besides, the name, Pomona, would always be suggestive to him not only of the child's birthday—when, as I have said, the apple blossom was in full beauty outside the window—but of all that short year of happiness. The little home was called 'the Orchards,' not on the *lucus a non lucendi* principle, as houses in the suburbs are named 'the Cedars,' 'the Chestnuts,' and so on, regardless of the vegetable growth in the little front gardens. But in this case the house was literally surrounded by orchards, and could only be reached by a path under the gnarled branches of apple-trees; and tall men had to look out for their hats as they entered, and blossom fell like snow on the coffin as it was carried out.

It was the blossom season when they first came home after their short wedding tour. It seemed almost unbelievably sweet and idyllic that first evening, as they sat at tea with a great bowl of cowslips in the middle of the table, and Katharine taking her place for the first time as mistress of the house, with a pretty air of importance. The sweet May twilight crept upon them as they sat lingering over their meal, and suddenly, from a bush close outside, a nightingale's liquid note trembled on the fragrant air. Only a year ago!

But it was not only in the spring-time, but all the year round, that the apple-trees seemed connected with their happiness. To one of the twisted boughs he had fastened the hammock where so many of the hot sultry summer afternoons were spent, with the bees drowsily humming round, and only an occasional twitter breaking the summer silence of the birds. Under another tree, the little afternoon tea-table used to be set; and day after day they noticed how the little green apples grew and rounded and yellowed and blushed, till at last the whole

orchard was full of red and russet and golden fruit, a garden of the Hesperides, at which the school-boys cast envious eyes in passing, eyes which Katharine could never resist, generally responding to them with an apronful of apples, which naturally doubled the number of envious eyes on the following day.

And when they were all gathered and stored away, the orchard was yet lovely with the yellow and brown foliage thinning on the trees, and the fragrance of the dead leaves on the grass, and the soft emerald mosses and gray lichens showing on the crooked trunks as they had not done in summer-time. And at Christmas there was mistletoe on the tree in the corner; and he picked some from the frosty boughs, which made a clear sharp-cut trellis-work against the cold, pale blue sky; and he kissed his wife's sweet face, pretending that there was need of mistletoe privileges to excuse such a very ordinary occurrence. And on New-year's Day came the snow, turning the orchard into fairyland, with every twig and tiny branch outlined in purest white. And now, again, came blossoming-time, only the flowers fell on a coffin carried out. And that brought him back to the empty present, and the necessity for arranging for the future.

'Let me have the poor baby,' his mother had sent word, being too much of an invalid to come to her bereaved son; and her husband had scrupulously delivered the message, though even the deep melancholy of the occasion could not prevent the exchange of a half-comical glance between father and son as he did so.

Mrs Ludlow was a person of whom poor people would say—unconsciously conveying, as they often do, a very real fact—that she enjoyed bad health. Her health was her one interest. I do not know what she would have done if some day she had realised the fact that she was quite as well and strong as the majority of other people, that there was no reason why she should not get up at a reasonable time and dress in a reasonable way, discarding dressing-gowns or tea-gowns—which, by the way, to the uninitiated seem only a glorified form of dressing-gown—and eat a reasonable meal, and go out into the air and sunshine, and be of some use to somebody or something in the world.

But she never did realise the fact; and perhaps, after all, it was not a fact, and she really was too frail and sensitive and delicate to take a share, even the smallest, in God's great, active, workaday world. But the idea of her with a baby was comic even to a broken heart, and to her indulgent husband, who believed implicitly in every ache and pain and fainting and palpitation. A baby that cried! Even at this early age it was capable of a cat-like sound of considerable volume and great persistence, and no doubt would develop into much louder performances as it grew older. A baby who might have fits, or fearful difficulties over teething, or whooping-cough, or other distressing infantile complaints, encroaching on Mrs Ludlow's prerogative of being the one invalid in the house. A child, who, after babyhood was passed, would be romping and fidgeting all over the place, tumbling about, injuring itself or other things of more importance; for, after her own health, old china was Mrs Ludlow's special hobby. All this flashed

through Mr Ludlow's mind as he delivered the message with a little twinkle in one corner of his eyes, that were so full of sincere sympathy with his son's misfortune.

'Thank my mother very much,' Owen had answered; 'but I think I can make another arrangement about the child.'

And his father, with eager acquiescence, said: 'Yes, yes! to be sure; yes, yes! of course,' in a nervous way he had; and fortunately did not inquire what the other arrangement might be, seeing that Owen himself had no idea.

Now, as he sat by himself—how much by himself!—that evening cogitating, the baby seemed to him almost the worst part of his misfortunes. The clergyman of the parish, as he bade him good-bye, had pressed his hand and murmured something about his not being left without a little spark of comfort—that the baby would be an interest and happiness to him; and Owen tried to respond fittingly, and not shock the reverend gentleman by expressing a wish that it were allowable to drown babies like superfluous kittens, and by declaring that if he were to look for comfort and happiness in the future to that little red object encased in flannel, the prospect was a poor one indeed.

He had an overwhelming longing to get away, out of all the associations that had been so sweet, and were now so bitter—to go where he and Katharine had never been together—to live a life that she could not have shared—to bury himself entirely in some work that would occupy heart and mind and eyes and brain, leaving no room for the loving and thinking and watching and listening that seemed all his being, and to have been turned by Death's ruthless hand into keen and constant suffering. The gaping desolate void must be filled somehow, if he was to live—no matter what rubbish was shot into it, it must be filled before he could begin building up the edifice of his life again.

But the baby seemed to prevent this entire cutting himself adrift; he could not—thank Heaven!—take it with him, racketing about in bachelor's quarters at home or abroad; and he remembered fearful stories of children placed out to nurse being neglected and ill-treated; and, for Katharine's sake, he would not wish this to be the case, any more than he would have allowed a small kitten that her gentle hand had fuddled, or a robin that she had rescued from the snow and coaxed back into impertinent bright-eyed life, to suffer, now she was gone.

He could not detect in his feelings any of that parental affection which he understood sprang into existence on the birth of a baby; he sought in vain for any of the foolish admiration that makes young parents so ridiculous; he did not consider it at all a wonderful or even interesting production of nature—certainly the most prejudiced beholder could not call it even decently good-looking. He went up more than once to look at it as it lay asleep, and he tried to feel a kindling of warmth at his heart, the very faintest throb of fatherly love or pride; and the nurse sobbed aloud at the touching sight, and told the other servants, 'Twere enough to break one's heart to see him so wroop up in the child as couldn't tear himself away now!'

But Owen Ludlow turned away each time with

a deeper conviction that it was no use trying to fill the great void Katharine had left with that dreadful little object up-stairs. But he had not got any more forward in arranging his future plans; and it was almost a relief to be distracted from the consideration of them by the sound of wheels in the road outside, wheels that stopped at the white gate, by which a path under the apple-trees led up to the house. It was nine o'clock by this time, and on that unfrequented road the sound of wheels at that hour was unusual; but perhaps it might be the carrier from the county town.

If Owen Ludlow had not been only too willing to be distracted, he might not have noticed the interruption; but as it was, he hailed it with pleasure, were it only that just for a minute it silenced the nightingale outside, which seemed to be using all its arts to tear and harrow the husband's heart with exquisitely sad sweet memories. He got up and looked out into the orchard, where the stars gave a dim light; and he saw a tall woman coming up the path, and a shine of carriage-lamps at the gate behind her. It was a lady; even in the semi-darkness he could see by the way she walked that she was not one of the villagers; but there was nothing familiar to him in the figure, though he quickly ran over in his mind all the friends of himself or his wife who this could possibly be.

'A lady, sir, to see you,' the servant announced a minute later. 'I told her as you was very much occupied, and I didn't think as you'd care to see no one; but she said she would not detain you many minutes.'

'Did she give any name?'

'No: she said!'

But the dimensions of the Orchards were so small that, as the servant stood holding the dining-room door in her hand, any one at the front door must be standing almost immediately behind her; and the visitor at this point undertook her own introduction, and, passing the girl, entered the room, saying, 'I must apologise for intruding at such a time; but I have something of importance to speak about, and this may be my only opportunity.'

She was tall, above the general height of women; and the effect of height was increased by the long straight cloak she wore, and the way she carried her head, which made Owen Ludlow feel as if he were shorter, though in fact he was not.

He bowed rather awkwardly, and drew forward a chair for her; while the servant with some reluctance closed the door, being naturally anxious to find out who this strange and late visitor might be.

'And quite the lady, as one could see with half an eye; and never been here before, and come in a carriage and pair. Didn't we ought to ask the coachman if he wouldn't take something, Mary June, as may have come a long way?'

But on reconnoitring, they found there was some one else—another lady in the carriage, which damped their hospitable intentions; and they also discovered that the carriage that looked so imposing in the dark with the lamps was only a fly from the station hotel at Courtlington, five miles off—'as it ain't no good wasting good beer on a flyman.'

But meanwhile in the little dining-room a

strange proposal was being made to Owen Ludlow. The lady had put up her veil, and showed a face that was almost lovely, only it had such an unhappy, dissatisfied look in the gray eyes and drooping lines of the mouth.

'You will hardly know my name,' she said; 'but I was at school with your wife, and she would have remembered Marjory Grant very well.'

'I remember her speaking of you,' he said.

'I am Lady Lester now, and I have been married eight years.'

Memories were coming back to Owen Ludlow's mind of his wife talking of her pretty school-fellow, who had married directly she left school—he fancied she had said a man a good deal older than herself. He remembered stories of school-girl pieces of fun in which this Marjory Grant had been ringleader, full of wild spirits, and up to any amount of innocent mischief and harmless adventure. But perhaps this was some other girl, for this sad-faced Lady Lester did not seem capable of madcap frolic.

'I have never seen Katharine since we parted at school; but when I heard of—your loss, it brought it all back to me so vividly, that as I was staying one night at Courtlington, I thought I must come, even at the risk of intruding on your sorrow, to tell you how much I loved her, and how sorry I am.'

'Thank you,' was all he could answer as he pressed the hand she stretched out to him, for the tears in her eyes made his grow dim and choked his voice.

'But this is not all,' she went on. 'They told me the baby was living. I have none; and I want you to let me have hers.—Wait a bit!' She stopped his reply. 'Is the baby (a girl, isn't it?)—is she very, very dear to you? Is she a great comfort to you? Because, if she is, I won't say a word more. But if not—for something in Owen Ludlow's face reassured her—'if not, I want you to let me have her. I don't mean merely to bring up for you, but altogether—entirely—to be my own little girl.'

'But'—he began hesitatingly.

'Yes; I know,' she went on eagerly. 'No doubt it is impossible; but just let me put my case fairly before you decide against me. You know, or perhaps you don't know, that my husband, Sir Hugh Lester, was a widower when I married him, with two boys; so your little girl won't be a great heiress if you let me have her. She will only have the little I have of my own. My husband is all that is good and kind; I have not a word to say against him' (But perhaps a little sigh that filled up a pause here might have told a little tale, if Owen Ludlow could have interpreted it)—'and the boys are dear fellows, and as fond of me as if I were their own mother, but—I have none of my own.—Well'—she went on, after another pause, eloquent with the unsatisfied longing and yearning that perhaps only a childless woman could sympathise with, which certainly Owen Ludlow could not appreciate, who would have given all the babies in the world for the one life he had lost—'well, my husband is quite willing I should adopt a child; he is most indulgent to all my whims and fancies; he took endless trouble to get a dog he thought would please me; my horses are the envy of all my

friends; he spends fabulous sums on orchids for me; he is quite glad when I express the faintest wish for any costly luxury that he can get for me. He only stipulates about the child that it shall not be picked up anywhere out of the mire, from among waifs and strays, of unknown parentage, who may inherit bad tendencies of mind and body, disease or vice.—He is very sensible and very good, you see,' she went on. 'It is all open and above-board as far as he is concerned; and it can do no one any wrong, as, of course, the boys will inherit all the property, and my (?) little girl will only have what I can give her. It is no case of palming off an heir or altering the inheritance in any way, as one reads of in books, but just to give me a dear little girl to love, and make me happy, with my husband's full consent and approval.'

She was silent now; but her great soft eyes looked so pleadingly at Owen Ludlow that he still seemed to hear her earnest voice entreating for what was of so little value to him, for what he had only that evening been realising was an embarrassment and a burden. And then before his mind came the memory of a letter from an old artist friend of his, received a week or two back, and not thought of during all this time of agitation and anguish, telling of his speedy departure for the Rocky Mountains, where he was going in search of health and scenery. 'Ah, Ludlow,' he finished up, 'if only you were not married and done for, and could strike your tents and come along with me, what high times we might have!'

Lady Lester's eager eyes detected the signs of wavering in his face. 'You shall never regret that you have trusted her to me,' she said. 'I think Katharine would have liked me to have her baby—above all, if she could have known how sorely I want something all my own to love and care for.'

'You will let me consider the matter,' he said; 'it is too important a thing to decide in a hurry.'

'Of course,' she answered—'of course. But—' if it is to be so, is there any object in delay? I mean, if you do not mind—my husband does not—that she shall bear my name, and be supposed to be my own child; and it would be best, I thought, if you would let me take her away with me to-night. My maid is waiting outside in the carriage; she is used to children, and can quite take care of her till we get home, and can find a regular nurse for her. And besides, I am only staying one night at Courtlington, and am on my way to Weymouth, where my husband will join me later on. He is yachting with the boys. He will be at Southampton to-day, and I will telegraph to him at once what I have done.'

But it would take too long to recapitulate all the arguments Lady Lester put forth in support of her plea, while, all the time, another advocate within himself was urging the relief it would be to know that Katharine's baby was happily and safely provided for, and himself free to go clear away from all associations.

Honestly, when he analysed his feeling for the baby, it was scarcely as deep and warm as what he felt for many of his wife's possessions—the dresses she had worn, the rings he had kissed on

her dainty fingers, the lace that had lain soft and warm round her neck; and he would not pretend to more feeling than he could truthfully detect in the heart that seemed buried in his wife's new-made grave. So, at the end of half an hour, the old nurse, nodding in her chair by the side of the bassinette, was startled by the apparition of a tall lady standing there, looking down at the baby with a look of such delight and pride as the old monthly nurse in all her wide experience had never seen but on the face of newly-made mothers.

'My own little girl!' she said as she drew back the flannel from its head with fingers that seemed trembling to snatch the baby up and satisfy with kisses the hungry look on the lips and in the loving eyes.

'A sweet, pretty lady too!' the nurse imparted to the other servants when she was gone, though she did not think it necessary to impart any share of the sovereign that was slipped into her hand at parting; 'and, as far as I could make out, some kin to the poor dear that's gone, and favoured her a bit in features, if I weren't mistook. Anyhow, she were terrible set on having the baby, and would have took it off there and then; only the master, he wouldn't agree to that nohow, and 'twere plain to see he didn't half like to let it go, being that wrop up in it, natural like. So it was settled as it were to be all ready by the day after to-morrow, when her ladyship's own maid would come over and fetch the precious lamb. Yes, 'twere her ladyship, sure enough! though I can't mind the name as the master called her, and never heard tell as the missis come of such high folk, though she were a born lady, poor dear, as ever were. She asked all sorts of questions about the bottles and milk and how much was to be give at a time. She weren't one of them as thinks they knows better than an old woman as has had to do with babies afore they was born or thought of.'

Not all Lady Lester's blandishments would induce Owen Ludlow to agree to her carrying off the baby then and there. Time must be allowed for Sir Hugh to be communicated with, and a letter received from him fully confirming all that Lady Lester had said of his willingness to adopt the child. And on one other point Owen Ludlow was determined, though Lady Lester demurred, and though, after all, when he came to think of it afterwards, what did it really signify to him what name the child should bear, when he was never likely to hear or see anything more of her? and this point was that the child should be named 'Pomona.' It was unreasonable, he felt, to insist upon this; but it was a slight salve to his conscience, though he was hardly conscious that it required salving, or that it gave him the slightest uneasiness; but it made him feel less weakly acquiescent to make some difficulty, even a childishly unreasonable one.

'It is not a very pretty name,' Lady Lester said; 'and I am afraid Sir Hugh may not like it; but it has the advantage of being uncommon; and if you really wish it so much, of course it shall be so. I will telegraph to Sir Hugh the first thing to-morrow, and you will hear from him the following morning.'

So just for one more day, Owen Ludlow heard the baby's cry from the room up-stairs and the

sound of the rocking-chair on the floor, and saw the old nurse pottering up and down under the apple-tree, with the sunlight through the branches falling on the soft white bundle in her arms, and a stray blossom dropping now and then. Perhaps that day he felt something more nearly approaching the paternal sentiment than he had ever done before, such is the contrariness of human nature; and once he found himself hoping that Sir Hugh's reply might not be favourable, and that he might, after all, have to take the baby Pomona into the calculations of his future life. But the next morning brought a hearty, manly letter from Sir Hugh, fully endorsing all that his wife had said, and thanking Owen Ludlow for agreeing to a plan that would so largely contribute to his wife's happiness.

And soon afterwards Lady Lester arrived with a responsible-looking nurse, and carried off the baby, with profuse expressions of gratitude to Owen Ludlow, and liberal tips to the servants; and when the carriage had driven away, and he turned back up the orchard path, it seemed as if he were returning from another funeral, or rather as if the funeral of two days before had been completed, and the baby buried with her mother; and the house seemed emptier than ever.

He gave a little gasp, as if it caught his breath, when, a few days later, he saw in a paper the announcement among the births, 'On May 30th, at Weymouth, the wife of Sir Hugh Lester of a daughter.'

But he was in the Rockies, and beyond the reach of English newspapers, when six months later, there was an account of the terrible railway accident in Scotland in which Sir Hugh Lester's two sons lost their lives; nor did he see the announcement, the following year of the death of the baronet himself.

SOME VILLAINS OF FICTION, AND THEIR FATES.

WHILE a great deal has been written on the subject of the heroes and heroines of fiction, comparatively little notice has been taken of its Villains—a neglect, no doubt, richly merited. And yet one is tempted to think that many a favourite novel with its villain eliminated would prove dull reading enough. There is little room for the old-fashioned conventional villain in the new school of fiction, which substitutes for plot and thrilling story an elaborate analysis of character. In dealing, too, with the lives of everyday people, the melodramatic scoundrel would be out of place. Hence his absence from the pages of Miss Austen's works, in which the quiet country pursuits of our forefathers, while George III. was king, are so vividly described. It is therefore to the narrative authors of the romantic or realistic schools that we must turn to find the villain without alloy.

One might divide the rogues of fiction into certain classes, such as the hypocritical, the gentlemanly, the blood-thirsty, and so forth. Sir Walter Scott has several types of rogues—the learned rogue, like Rashleigh Osbaldistone; the unscrupu-

lous and scheming lawyer, like Glossin in 'Guy Mannering'; the wild and lawless rogue, like Dirk Hatteraick, the Dutch smuggler captain. In some novels we find the villain claiming no small part of our sympathy, and Scott confessed that his rogue always, in spite of him, turned out his hero. Poetic justice, however, is generally meted out to his evil characters, and many of them come to violent ends. Richard Varney, on his capture, after the murder of the Countess of Leicester—disclaiming to drag on the remainder of his life a degraded outcast, and not wishing that his fate should make a holiday to the vulgar herd—swallowed some strong poison he was wont to carry about his person, and was found dead in his cell—the habitual expression of sneering sarcasm still on his face. His accomplice, the ungainly Anthony Foster, perished miserably in the cell whither he had fled to escape arrest, forgetting the key of the spring-lock by which alone his egress could be effected. Dirk Hatteraick, the accomplice of Glossin in kidnapping Henry Bertram, and the murderer of Meg Merillies, hanged himself in the condemned ward of the jail, which had likewise witnessed the death of Glossin at the same hands. The unprincipled Lord Dalgarno, on his way to fight the duel with Nigel Olifaunt at Camlet Moat, was shot by Colepepper, or one of his ruffians, in Enfield Chase; while the Alsatian Captain himself did not survive the fierce attack of Richard Monipples. One of the most interesting of Scott's characters is Rashleigh Osbaldistone, with his learning and his want of moral principle—the clever man of that country where clever men were scarce. Nevertheless, he is a knave, and, as a reward for his treason, perishes at the hand of Rob Roy, with the hatred of his cousin Francis strong within him, even in the moment of death. Jobson, the rascal attorney—a very favourite type with Scott, as with Dickens—had his name struck off the list of attorneys, and was reduced to poverty and contempt.

For a mind such as Thackeray's the study of evil had a certain fascination, and the character of his rogues being always carefully drawn, we see them as they are actually to be found in life—rather weak than wicked, vain and selfish more often than malignant. Any good which may be found in them he never fails to bring out. Barry Lyndon is a type of the adventurous scoundrel—not without certain redeeming features—dear to the heart of Fielding and Smollett. The son of a man of fashion, Barry was possessed of many accomplishments. He had a quick ear and a fine voice; he stepped a minuet gravely and gracefully, and was unrivalled at a hornpipe and a jig. His reading consisted exclusively of novels. After a round of adventures, in which he exhibits almost every vice save that of cowardice, he passes the latter end of his life in the Fleet Prison. Thackeray had a horror of gambling, and its evil effects form the moral of many of his tales. One example is to be found in the history of Mr Deuceace, the son, more sinned against than sinning, of the Earl of Crabs. His miserable fate is not rendered less pathetic by being described in the vernacular of James Yellowplush—seated, shabby and unkempt, with

a poorly-dressed, ill-used woman by his side, on a bench in the Bois de Boulogne as the Earl and his bride drive past him without recognition. Of Thackeray's other more or less unprincipled characters, Lord Steyne is a striking example. A meaner but equally unprincipled character was Sir Pitt Crawley, who died at the good old age of fourscore. Barnes Newcome is the picture of the hypocritical rogue, outwardly irreproachable, of whom Dickens has given us so many examples. Of his fate the novelist says: 'My impression is that he married again, and it is my fervent hope that his present wife bullies him'—a wish the reader must cordially reciprocate.

No writer has a more plentiful supply of villains of all kinds than Dickens. Many of his characters are meant to exemplify different vices—as, for instance, unscrupulous selfishness in Jonas Chuzzlewit; or hypocrisy in Uriah Heep and Pecksniff; or, again, miserliness and its effects in Ralph Nickleby. Some of his figures are undoubtedly melodramatic, as Sir Mulberry Hawk or Carker; the gentleman rogue is one of the least happy of his portraits. Grotesquely horrible figures, such as Quilp, appealed strongly to his imagination, and have never been more powerfully depicted. Most of his rogues meet with the just reward of their deeds, as became the moral purpose of his books. Jonas Chuzzlewit, after attempting to poison his old father Anthony, and after murdering Montagu Tigg, himself takes poison as he is being carried off to jail. The first word he had been taught to spell was 'gain,' and the second 'money.' Gashford, the Secretary to Lord George Gordon—who imposes on the credulity of his master, and prompts the rioters to burn the Warren, where Geoffrey Haredale lived—also commits suicide. The villain Rudge, the father of Barnaby, came to the gallows. Ralph Nickleby took his own life—a moral to all such as are of a hard and grasping nature—'he had torn a rope from one of the old trunks, and hanged himself on an iron hook immediately below the trap-door in the ceiling to which his son had looked so often in childish terror fourteen years ago.'

The description of Fagin in Newgate awaiting execution is among the most thrilling in the pages of fiction; the face of the old Jew, retaining no human expression but rage and terror, haunts us as that of Quilp or Quasimodo. Hardly less terrible is the scene of Bill Sikes's death there in Jacob's Island, 'where the buildings are the dirtiest; and the vessels on the rivers blackest with dust of colliers and the smoke of close-built, low-roofed houses.' From the parapet of such a house it was that he fell in his effort to escape his pursuers, five-and-thirty feet into Folly Ditch, followed even to death by his faithful dog. The railway engine, employed as an instrument of fate, lends a tragic interest to the death of the smiling villain Carker with his white and glistening teeth. He uttered a shriek as he looked upon the engine, and 'saw the red eyes bleared and dim in the daylight close upon him—was beaten down, caught up, and whirled away upon a jagged mill that spun him round and round, and struck him limb from limb, and licked his stream of life up with its fiery heat, and cast his mutilated fragments in the air.' Rogue Riderhood in 'Our Mutual Friend'

perishes in a struggle with Bradley Headstone, near Plashwater Bridge. Both were found lying under the ooze and scum, behind one of the rotting gates of the lock. Quilp, the almost inhuman dwarf of Tower Hill, drowned himself as he was on the point of being arrested for felony—an appropriate ending to a life of moral and physical squalor.

Of Dickens's less malignant characters, Squeers, with his one eye, and forehead villainously low, adds the theft of a title-deed to his ill treatment of schoolboys, and is transported. Uriah Heep and Steerforth's valet Littimer are consistent hypocrites, till we lose sight of them in prison as No. 27 and No. 28—Uriah, the 'unblest person going, suffering the penalties of the law for fraud, forgery, and conspiracy—a deep plot for a large sum; while the valet expiates the robbing of his young master the night before they were going abroad. That arch-hypocrite Pecksniff lingers on shabby and out-at-elbows with drink, his worst enemy.

The fiction of half a century or so ago produced such a plentiful supply of highwaymen, cracksmen, and other heroes of the Newgate Calendar, that Thackeray exclaimed, 'The public will hear of nothing but rogues.' Fielding had described the adventures of Jonathan Wild, and now Jack Sheppard was made the hero of a tale. Dickens produced 'Oliver Twist,' and Bulwer-Lytton a series of stories in which the harshness of the criminal law and various other social grievances were illustrated in the careers of such as Paul Clifford. Some of his rogues come to very melodramatic ends. Gawtreys, the false coiner in 'Night and Morning,' is a vivid picture of a man well educated and full of animal spirits, suffering for another man's crime, and at war with society. He is shot in attempting to escape from the Paris police—falling from the parapet of the house with a groan or rather howl of rage, despair, and agony, which appalled even the hardest on whose ear it came. Lord Lilburne, in many respects more guilty than Gawtreys, escapes the outward retribution which overtakes crime; the novelist's idea being, that if vice is to be punished it must be from within. 'The Lilburnes of this hollow world are not to be pelted with the soft roses of poetical justice.' The brutal ruffian Houseman—whose only redeeming trait is the love of his daughter—is contrasted with the scholarly Eugene Aram, who yet is led to commit murder; showing once again that intellect and morality may in some instances be divorced. Houseman, in spite of his crimes, died in his bed without violence, having maintained himself by dressing flax. His life, however, was several times attempted by the mob; and when he died, his body was buried secretly at dead of night. Arbaces, the wily Egyptian priest, who crushed all who stood in his path in the 'Last Days of Pompeii,' was himself crushed in that supreme convulsion of nature by the shattering of the tall column that supported the bronze statue of Augustus.

Among Wilkie Collins's rogues one of the most interesting is Count Fosco in 'The Woman in White.' He was compounded of two almost distinct individualities. On one side of his character he is vain, fond of music, and of pet animals—white mice, a cockatoo, and a couple of canaries

—on the other, the calm conspirator with the cold glitter in his unfathomable gray eyes. As a definite moral ending was expected by the public, the novelist tells us how his body was discovered in the Morgue at Paris. In 'Arncliffe,' the villainy of Dr Bashwood is cast in the shade by that of the would-be poisoner, Miss Gwilt, who puts an end to her own life, on the failure of her scheme, in Bashwood's sanatorium.

Charles Reade generally employs a principal and a subsidiary rogue of a more or less conventional type to show off the charms of the heroine and the resources of his virile hero to the best advantage. Thus we have Woodlaw and Wylie in 'Foul Play,' Richard Hardie and Skinner, and many others who suffer the just reward of their deeds. John Meadows, with the cool head and iron will in his search for wealth and respectability, nevertheless incurs a charge of theft; but in illustration of the principle of the book—'It is Never too Late to Mend'—shows promise of repentance and a hope of better things in the new land whither he sails with little Hannah and his old mother of threescore years and ten. The more despicable villain Crawley, left to his own resources, practises at the County Courts in his old neighbourhood, and drinks with all his clients, who are of the lowest imaginable order. Sir Charles Pomander belongs to the 'bold, bad Baronet' type of character; and the persecutor of 'Peg Wollington,' rich, handsome, and witty, with a hard head, a tough stomach, and no heart at all, has many points of resemblance with the Sir Marygrave Pollexfen of 'Sir Charles Grandison' or the Lovelace of 'Clarissa Harlowe.' Dickens's similar character, Sir John Chester, is killed in the duel with his enemy, Geoffrey Hamdendale. Less enviable, perhaps, was the fate of Pomander condemned for eight years to drag the chain of a life from which all pleasure had gone out.

THE BURDEN OF ISABEL.*

CHAPTER XXXV.—'HE THAT *will* BE RICH!'

GEORGE SUFFIELD, the elder, arrived in Lancashire early in the evening, and drove home at once to Holdsworth Hall. His son, he found, was away—had been away, Tummas said, since ever 'th' mester' had gone yesterday. He had left no word with Tummas where he had gone ('Nay,' grunted Tummas, 'Mester George doan't trust me wi' nought; he believes sœ much i' th' black fellow!'), so that Mr Suffield had no resource but to wait, with what patience he could muster, for his return, or for the morning.

He slept ill, and rose betimes, while it was yet dark, and went to the works. The air was already filled with the laboured breathing of the engines and the whirr of bobbins and clatter of looms. It did him good to hear these sounds, and it made him proud, more than all the mumble and gossip, the speeches and the 'Hear, hears' of the House of Commons. He said to himself 'Ha, ha,' like the war-horse among the trumpets, and the thunder of the regiments; he shook himself together, and longed to be in

among the crowds of workers, with the monstrosous music of the machinery in his ears.

'I shouldn't ha' listened to Joan!' he said to himself. 'That I shouldn't!'

The old lodge-keeper stared a moment or two, speechless at sight of him: it was the first working day after the Christmas holidays.

'If here bain't th' owd mester himsen! Aw'm right glad to see tha, mon!' exclaimed the lodge-keeper, as if he were himself the master, giving his hand to Suffield. 'Ec! but it'll set th' folk up to see yo'!'

'Thank you, John—thank you,' said Suffield, heartily shaking the hand of his old retainer. 'I'm just come down on a special matter o' business. My son, I suppose, left no word if he would be here to-day?'

'Mester George? Not he! He left no word wi' me.—But how's tha able to leave th' business o' th' country?—th' making o' Laws and Acts o' Parlyment and sech? How's things, mon? For we're as ignorant here as peas in a pod.'

'Well, John,' said Suffield, 'th' Queen has not axed me yet to be her Prime Minister; nor made yo', John, a Justice o' th' Peace.' And so he walked on, while John closed the gate, laughing to himself. 'Th' owd mester!' he murmured. 'He aye likes his joke. Nae much th' matter wi' a mon as can crack his joke.'

The old 'mester,' spite of having heavy stuff on his mind, could not refrain from giving himself the pleasure of a walk through the workrooms of the several buildings. It was agreeable to him—and it would have been instructive to a stranger—to see how all faces lighted up on beholding him, and how cheerily he was greeted by those whom he addressed, managers, foremen, or operatives: the abounding goodness of his nature touched them all.

'Who's in th' new building?' he asked of a manager at his elbow.

The manager answered that So-and-so was—a trustworthy person whom Suffield himself had left in charge.

'I'll go and have a look at it,' said he.

Arrived in the new building, where the special printing machines were at work, of the drawings for which Daniel Trichinopoly had made stolen copies, Suffield questioned the manager in charge: Where were the drawings kept? In the office, the man believed. Was that rule strictly carried out, that no one but those engaged in the building and sworn to secrecy should be admitted? It was. Had the manager ever seen Daniel Trichinopoly there? Never. Where were the keys kept? In the lodge with the other keys.—Suffield made little account of the last two answers; for he remembered that a year ago, when no one was supposed to be in the building or to be able to get into the building, Ainsworth had declared he had seen Daniel there.

Thence he went to the counting-house. The book-keepers and pen-men in general were not come yet; there were but that clerk who took the turn of early work, and an old woman dusting the desks. Suffield marched into the inner office, and up-stairs into the sanctum that used to be his own. He knew where the plans of the new machines had been wont to be kept. He went to the safe, of which he, as well as his son, carried a key, and opened a drawer: there were

the plans. He took them out and unrolled them on the table; he believed they looked dirtier, and they certainly bore marks of pencil-tracing. How could George have been so careless as allow the black Daniel opportunity to handle and use them?

He put the plans away—in the safe again—and then he sat down and thought. If the black Daniel had been able to play his own rig with these plans, what might he not have done with other things? George was palpably careless. There stood an Account Book left out; and there in a drawer was a key. There might be nothing of consequence in the drawer; nevertheless—Mr Suffield's business experience declared that a key neglected, for whatever reason, meant a weak link in security; and that a drawer left open was a temptation to open drawers. He went to the door and asked the clerk in the outer office, 'Does Trichinopoly come much here?'

'He's mostly up at the Hall with Mr George, and sometimes in the City,' answered the clerk.

In the City office, of course, thought Suffield—helping with the export to India and the Straits. He was about to lock the safe up again, with the resolution to go through everything carefully with George when that young gentleman should appear, when he noticed the cheque-book of the firm lying before him—a volume which was to most cheque-books as a folio is to a duodecimo. He took it out and began to look at it. As he read one counterfoil, and another, and another, he occasionally raised his head with an amazed air, and then resumed his scrutiny with contracted brows.

'I don't understand this, my lad,' he said at length. 'There's more here than I bargained for. But I must wait.'

So he resolutely closed the book, locked it up in the safe, and took his way to the Hall for breakfast. Tummas would gossip with 'th' owd mester,' but for all that, breakfast was soon set upon the table. His solitary meal did not encourage cheerful reflection. Why, he asked himself, was he sitting there alone? Had he been weak in humouring his wife, and giving himself up to the pursuit of parliamentary honour, and had he been precipitate in handing the entire control of his business over to his son? He thought it somewhat hard; but he saw that even at fifty a man must buy his experience like the most reckless youngster.

After breakfast he sat a while, and looked at the paper, and looked at the clock. At length he rose, went into the hall, summoned Tummas to brush his hat and coat, and set off to walk to the station, as aforetime, to take the train into town: perhaps, he thought, his son would go to the City first.

In the City office he found the manager and the clerks in their places, but no George. The manager, however, said that 'Mr George,' he believed, was in Liverpool on business, and would probably be back after lunch; so Suffield went forth into the City to see how the world of Lancashire commerce was moving: he had known nothing of that world, except from the newspapers and the gossip of his son, for a good many months. He went to the Athenæum and read the telegrams of news and of prices; and then he went on 'Change. He exchanged salu-

tations and he listened, and the more he listened the more bewildered he became; he overheard whispers about cotton, which—he was certain—were hushed or changed into another venue as he approached. One old acquaintance was frank with him.

'Well, George,' said he, 'what's the game to-day? It's ages since we've seen you here. Is it "futures" or "spot"? There's not much, you know, in the way of futures. They seem to be covered mostly by this rascal that's trying to "corner;" but, between you and me, George, I believe there's more than a Parsee or two in that corner: there's somebody behind them.'

'There is a corner, then, in cotton?' said Suffield.

'Is a corner?' echoed the acquaintance. 'But I forgot: you're only a Parliament man now. Well, there is a corner; and there isn't a corner: for, it remains to be seen if it can stand the January business. No man, not even Morris Ranger, can keep the market in a corner for ever. Speculation is a blessing, but not as some men speculate. This particular corner, I believe, George, is going to become an open square. There'll be another big arrival this week, and then we'll see.' And so the old acquaintance left him.

Suffield returned to the office, where he found his son busily hearing and speaking through the telephone. He nodded to his father, murmuring aside, 'I heard you had been here, dad,' and went on with his occupation. After a little while George hung up the telephone mouthpiece and sat down.

'And what,' he asked, 'has brought you down here, dad?'

'You haven't got M'Fie's letter, then?' said the elder. 'Where, my lad, is your Daniel Trichinopoly?'

'Where?' echoed George; and the father saw the son turn paler than he had ever known him.

'Let me tell you, my lad, so far as I know,' said Suffield; and recounted to his son the story of the Philosopher from the beginning to the end.

'Gone!—is he?' said George, gnawing his thumb, and evidently putting a constraint upon himself. 'With copies of the plans? He certainly ought to have been here to-day, and he is not! The scoundrel!—Wait a moment,' said he suddenly; 'I'll make an inquiry.'

He turned round to his writing-table and scribbled a note. He blew through a tube, and a clerk appeared. He handed the note sealed. 'Wait for an answer,' said he; 'and make as much haste as you can.'

When the clerk was gone he explained his action to his father. 'You know,' said he—'you remember I told you—that Daniel put that hundred Uncle Harry left him into the bank. He has been speculating with it, I believe, and made something more of it. If he is really gone, he'll have taken that with him.'

'Just so,' said his father. 'And it seems to me, George, my lad, that there must ha' been a deal of speculation going on inside the firm, for him to go against th' rule. When I was looking after the business myself I made it a rule—"No betting on horse-races or gambling in stocks

here!" I'd seen too much harm come o' them, and I had made up my mind that no man that betted or speculated was fit to serve wi' me. I did not think, my lad, o' saying ought like that to you when I put you in charge, because I thought you had a proper, straight, clear business head on you.'

'But, my dear dad,' said George, 'everybody speculates in these days: where's the harm in speculation?'

'The great harm in speculation, my lad,' said his father, with something like sternness, 'is that it makes you unfit for proper business. When I was a youngster I betted a sovereign on a horse; that sovereign became five; but what became of those five I never could tell: it was "lightly come, lightly go." And I said to myself, "We'll ha' no more o' this!" But harm or no harm, the thing for you is that it must be either business or speculation: the man isn't born yet that can do both properly. If he tries to do it, he comes a cropper with either the one or the other.—Hast thou been speculating?' he asked plainly.

'Well—yes, father,' answered George, much disquieted by the elder's direct question and uncompromising tone; 'I have.'

'Humph!' exclaimed his father; 'I'm disappointed in tha, lad.—Cotton, I suppose?'

'Yes, father; cotton.'

'Much?'

'Well—that depends upon what you might think much.'

'We'll go into that presently. I keep hearing about a corner in cotton: dost tha know ought o' that?'

'Yes; I know something of it.'

At that critical point the clerk returned and handed George a note.

'It is from the bank manager,' said he, when he had opened it. "'Mr Trichinopoly himself withdrew his account on December 22d." That's more than a week ago! It's the day he went for his holiday!'

'Drew the money and went off to London at once, I suppose,' said his father. 'Now, we'd better see that he hasn't drawn anything of ours.'

EILEAN DHU AND ITS FREQUENTERS.

As the advance of our so-called civilisation drives many of our rarer and more interesting 'uncivilised' friends farther and farther from ordinary ken, we seek to keep their images before us as they have recently appeared. So we drop down by boat towards the quaint and perverse island that is an epitome of a kingdom. A counterpart of a lion couchant in appearance, too, so it may be taken to represent the Scottish lion. It has at least a certain Scottish persistence in its character, and declines to be readily moulded under modern conditions. The Black-backed Gull is calling hoarsely as we approach, and circles around overhead with its many comrades; for this has long been a favourite haunt in the breeding season, and they know but too well, from increasing experience, that a boat bears only ene-

mies of their race. The nests are scattered about amongst the rocks and heath with the crudest of efforts after construction, and very embryonic attempts at concealment. The general colour of the eggs, and the very simplicity of the grass 'wisp' in a slight hollow, are indeed their greatest security. And this holds good with all its fellows about, whether Lesser Black-backed or Herring Gull. The piping Oyster-catcher, with its restless excitability and constant vociferations, dashes hither and thither, from shore to heathery knoll and back again, racing energetically along the beach after it drops upon it, and living in a mingled fool's paradise of having misled the intruder from its nest, and a purgatory of fear lest it should not have done so. If it only kept quiet, it would do better, as the eggs among the gravel of the beach are generally safe enough from an ordinary eye. What a row to be sure, as if all the world were after you! Your manners have not that repose that mark the proper aristocrat. You are only a wild-duck, startled out of your equanimity and your nest. There goes another with equal trepidation. They lie close, and conceal themselves and their nests dexterously, but beyond that they haven't an idea. In place of slipping through the heather and rising some distance off, they lose their heads, make all the row they can in their terror and surprise, and practically give up the game.

The rarer ducks we do not come upon in their accustomed haunts. Yet in these shallow holes under the fallen rocks the red-breasted Merganser, or Sawbill Duck, and even the Orange-bosomed Goosander, used to deposit their eggs, and trust to escaping the eyes of the enemy. But a greater and more ruthless enemy than man has too often found them out, and lived in too close proximity; for the Gray or Hooded Crow is too partial to eggs, and finds this mode of living so easy and agreeable, that it long made its nest in that aged elder-tree up amongst that debris of fallen rocks. Since our last raid upon it, as an enemy of rarity and beauty, it has shifted its nursery, but cannot be very far away. In its near vicinity were the nests of the brilliant Sheldrake, far under the larger stones, so as to be practically in burrows; yet they have not escaped the ravages of these gray rascals, and for once we do not startle a single Sheldrake to-day. Have these two ducks practically decided that it is of no use attempting to rear successors under the trying conditions, and left us thus so much the poorer? It looks very like it. Ha! here is one returning prodigal, we remark, as the Raven skulks along close to the top of the hill, and crosses the water in deadly fear and with indecent haste. It will not leave us long, however; and although it has not returned to the barrow-load of sticks on the rocky ledge, where it so long pre-empted the location, it has, like its gray congener, chosen a corner close by, but better hidden. The bold cragsman that invaded the sacred precincts behind that rocky ledge, when last it was so occupied, will never again disturb

your repose, and this year's progeny at any rate are practically safe to follow in your 'black but comely' footsteps. For a beautiful bird you are, although your ways are as dark as your sable plumes. The shepherd and the keeper are alike your deadly enemies. You have indeed, Mr Raven, no friend in feathers or in broadcloth, and to one and all appear as a type of the 'gentleman in black.'

But beautiful as you are in your glossy blues and blacks, how can you expect full consideration for your claims when you choose such very distinguished company? Just 'round the corner' on the higher part of the cliff, dwells, as it long has dwelt, the bold and beautiful Peregrine Falcon. I am grieved to think how many of the daring birds I have seen drop, never again to wing the empyrean from that rocky hold; yet, in despite of heavy losses and constant danger, there is a fascination in this bird-haunted island that enables the gay wooer of either sex soon to secure a new mate and continue the occupation. Like an old-time robber Highland chief in his eyrie, he or she, with such a point of vantage, will never fail of a mate; and is the world not made for the bold? How they flash out from the front of the cliff; and how we sympathise with the bold birds that have 'columbaria' in the cliff caves around a limited range, and seabirds at hand for a change, and duck for Sundays—with-out the green peas—and an occasional grouse for high-days and holidays. No wonder their wild 'keep' is always tenanted, despite periodic executions; for is not the female falcon the bolder and bigger and stronger of the two, and why should she hesitate to replace the slaughtered bride, at the prompt call of the bereaved widower, although in this the nesting season her risks are greater, and the demands of the young perforce draw her ever within the sphere of danger? With what pride she must look down over her domain, as she views her mate sweep back from the further shore across the intervening sea, his wings cleaving the air with a swift snap, and screeching gull or hoarse-voiced raven taking care to give it abundant sea-room.

The Kestrel, that used to nest on the other cliff, near the inquisitive rowan-tree, peering far over the ledge to watch the rare picnic parties that bivouacked beneath, has given up nesting apparently in this once happy isle, and has probably 'moved West.' Like the Yankee settler on the frontier, the place has got too civilised. Even the gay sea-swallows, that keep such good time in their advent, and are so wonderfully loyal to the place of their first choice, and in all probability the place of their birth, are beginning to thin off—or be thinned off! Is there no haven of rest to be left for those creatures that look askance at civilisation? Cannot we do something for our more bohemian brethren who love not the leash, the tether, or the hencoop? Do they not give us much in return for any little protection we can give them? What delight to view their displays of confident speed and power! What an insight into older conditions, that may yet one day be renewed conditions, when the cunning and the weak must give way to the bold and the strong, and the race again be to the swift. If we could but eliminate the hand of man from this natural gathering of rare creatures, what an

interesting study the island would provide us. In a ring-fence of greater security than Waterton's, with green to the very summit all the year, we have only to remove a few sheep or cattle to see the islet spring up into a forest of varied seedlings. Would the falcons increase then till they drove off their scared prey? Would the ducks increase and find shelter until the falcon dared not interfere? Would an internecine war take the place of the war with man, or would all settle down into a sort of recognised system of balance, in which too many of the 'stock' of the falcon would not be 'killed down,' and too many comrades would not be permitted to join in the foray? An over-accumulation of kinglets would not be likely, and each pair would keep its own rocky domain.

But the duck would revel in the deep undergrowth and heath; the gulls would hunt for the hidden nests and devour the eggs; the Grey Crow would consider that all these things were made by Heaven for its use! The Sheldrake, too, would return to the natural burrows; and the Sawbill utilise every suitable hollow. We should not have removed, perhaps we should have hardly lessened, the severity of the struggle for existence; but yet it would be less violent and artificial. Are we to be able to preserve the inhabitants of these spots where the rarer creatures gather; or will another ten years see as great a diminution of, and indeed, in some cases, disappearance of them, as the last decade has done? Will the otter still be able to green the turf near his lair; or would he decline to accept life under easy-going conditions, and seek some sterner scene of labour, should any protection be vouchsafed? There is so much that such an isle, under a kindly but observant eye, could tell us about; so much that we particularly wish to know about, that it seems a pity these little rendezvous for birds 'not generally known' should not be protected, in the interests of lovers of nature and of human nature!

ELSIE.

CHAPTER IV.—CONCLUSION.

WE were sorry when the vicar died, as he did in the following May, rather suddenly. I had reckoned on his joining our hands at midsummer, having a liking for his quiet impressiveness, so different from the sleepy automatism we had been accustomed to at Norton Priors. His reading of a burial would make all eyes wet; but, like April rain, there was a touch of sun in it, and the mourners went away easier at heart from the comfort he had given them. He had a way of joining happy couples which made the homeliest faces beautiful, for the sense that heaven itself had blessed them, and that there was no 'for worse' about it. And when the christenings came, he would turn every heart towards the little ones by his tenderness of way and the love for them beaming from his eyes.

Elsie was reminding me of these things, and telling how she came to admire and to work for him, as we walked in the lane the night of the funeral day. It was late, for she had been at a bedside at Nemoton till the 'bus had set out to meet the last up-train. I had been to the

funeral, and had seen Henry St John there, but was afraid to tell her so, and she avoided asking, though her thoughts must have turned to him many times, as she walked to and fro beside me talking gently of his father.

The moon rose big over Arbury Wood, yellowing to brighter gold as it mounted higher on its way; and I could see by its light the soft velvet of Elsie's eyes, and that something deep down in them which I could never fathom. I lost it as we turned for the last time and neared the mill; but as we stood beneath the privet arch leading to the garden, I saw it again, as she looked across to the moon dreamily.

'And yet there was a time,' said she, without turning her head, 'when I disliked the vicar almost to hatred. I thought him hard, and capable even of cruelty to any one who might stand in the way of any cherished wish or plan. He was'—

She shrank suddenly into the shadow of the arch, pulling me with her, and staring with wide eyes across at the stile of the croft. I looked too, and saw a tall dark figure approach it from the other side and lean on the top rail. And in the sheen of the moon I saw that it was Henry St John. Elsie trembled, and I could hear the quick thud, thud of her heart. A great ache grew to mine, and I was ready to groan when I looked across at the pale beauty of Henry's face as he gazed up at the house, thinking of Elsie. She was in my arms, and there was the man she loved.—Ah! the pain of it! For a moment my sight seemed to go; then a hot rage sent the blood round me, and I could have raised her up and hurled her across to him; but that, too, went off, and gave way to a mad sense of possession, which tightened my hold on her as she leaned heavily upon me. But she knew nothing of it, for, as I peered close at the pale oval of her face, I saw that her eyes were shut, and that her parted lips had lost their redness. I glanced back at the stile; but Henry was gone; then I laughed, and kissed Elsie's forehead passionately. Her lids quivered, and her eyes opened, staring absently up into mine, till memory came, and then she looked out again, trying gently to force herself from me.

'Let me go—how dare you!' she cried with sudden anger.

I loosed my hold, and stood still, the words ringing in my head strangely.

'Forgive me, George—I was hasty. I don't think I am quite well. Shall we say good-night?'

I said the word, and no more, and watched her glide away. But she turned again and ran back, and held her lips up for the kiss she had denied me. Could any man stand it? I caught her up and asked God to bless her always. And bless her He did in his own good way, though it was hard to see at the time that He had the handling of it.

For from that night Elsie was never the same to me. As our marriage day neared she appeared to lose all heart in things, all desire to say or do; and seemed no better than a parched lily that hangs its head in hopelessness. Her fresh comeliness left her; her face thinned down; and sometimes her eyes had in them a look like a spent deer when it falls and awaits the hounds at its

heels. I could bear it no longer, and saying nothing to any one, set out for London to where Henry St John had gone the day after the funeral. It was Saturday night when I arrived; but I traced him on the following morning to a big church in the suburbs, where I saw him in his vestments, assisting in the service. I sat till it was over, and then sought him at the Clergy House, as they called it, adjoining the church.

As simply as I could, I told him how things were—that he must marry Elsie, and not I. He listened quietly, his face a shade paler, and his blue eyes softening and hardening by turns. When I had done, he got on his feet, and paced up and down in a troubled way. I sat still, feeling very rough and coarse in such a fine room and beside such a man. He sat down again, and now I saw that his eyes had hardened and remained so. In a slow, deliberate way, he began to explain how he was placed; that out of love of his father, and a strong predilection for the work of his Church, he had resolved to devote himself to it, and to make no other ties. He had doubted the sincerity of Elsie's refusal, but had accepted it, from pride partly that he should be refused, and out of fear that he might for ever estrange himself from his parent by persisting in his suit. He had now reason to suspect that his father had seen Elsie, and prevailed upon her, by forcible arguments, to refuse him. I might have made this clear to him, but held my tongue, and let him go on, which he did eloquently, and with much good sense from his point of view.

But I thought of Elsie, and struck in impatiently. 'Sir,' said I, 'you can no more love mankind without first loving some one about you, than you can make a wheel without a hub. God made you two for each other, as He made the laws which show that every man can work better under the chastening influence of a good woman and of the home she hallows, than without such aid. But whether celibacy be right or not for one in your calling doesn't affect the duty before you. You have made Elsie love you, and you will mar, if not ruin her own life unless you take her to you and give her the loving support of yours. Man! man!—can you hesitate? Why, she's worth a thousand of you!'

'So she is, Crannock,' said he quietly and without offence at my outburst; 'and you don't know how your words try my fealty to the mission I have taken up.—Leave me; let me think it over; but don't hope. I may not lightly forswear principles such as mine. Go; and in a few days you or she shall hear from me, according as my decision shapes.'

And so I left him, and made my way to Norton Priors, which I reached after three days' absence. It surprised me to find the shop shut and nothing going on; but Dobson, across at the mill, seeing me staring about, walked over and made it clear. Jem and two of his children were down with typhoid fever; and Mrs Onslow had just sent for the doctor to see to Elsie, who had been sitting up with the little ones all night and had gone home feeling queer herself.

It was true enough; and in twenty-four hours Elsie was tossing about in her bed, delirious. I hung about the house, unable to do a thing, as

day followed day and she got lower and lower in the grip of the fever. It went to my heart to see her wasted face and her great eyes flaming so from their sockets, while her poor mad talk about Henry St John and the love she bore him nearly sent me mad too. But she got so weak at last that she could do no more than whisper, and that but seldom; and one night her mother and the doctor and I were all in the room together, expecting her to go every minute.

I had sent a telegram to Henry, telling him the news, and leaving it to himself to come or not as he liked. It was now past midnight, and the last 'bus had glided over the tan an hour ago, as I had seen from the open window. But while the minutes went on, and we sat saying nothing, a sound was borne in to my ears which set my pulse at the double. It was the faintest of sounds, hardly discernible above the hushed voice of the weir; but it drew nearer and nearer, till we could all hear the horse as it galloped its hardest towards us. It was muffled a minute as it came through Arbury Wood; but again the hoofs rang out, and in another three minutes were echoing like thunder in the quiet of the village. I looked from the window, and saw the horse on its haunches as the rider pulled up and leaped from the saddle. He saw my face at the casement, and I remember his breathless cry as he looked wildly up:

'Is she alive?—Elsie!—I've come to see her. Let me in, for God's sake!—She must not die!'

His voice rang into the room with odd effect on us all. Elsie heard it, and made a slight movement, murmuring his name. Then she breathed a faint little sigh; and the doctor bent his head anxiously, as if he feared her heart had stopped. But no—it was beating steadily; and he looked up with a light in his eyes, saying in a whisper that Elsie was saved.

I met Henry on the stairs, and told him what he had done. His head sank on my shoulder, and he wept like any girl. And I couldn't blame him, for my own eyes were wet, and my heart ready to split with its gladness. In such moments we do strange things, and what did I do then but kiss Henry on the temple, feeling drawn to him irresistibly. He had saved Elsie; and she loved him, and had every right to love him, comely as he was, and so tender-hearted.

I carried on the mill for a year or two after that, and was always glad to hear news of their happiness away in Hampshire, where they had settled. But I sold the old place, to Higgins at last, and the carpentering to a brother of Dobson's; for poor Jem was in the churchyard along with his young ones—and then I went Winchester way to say good-bye. It was then I had my last sight of Elsie as she sat in the Rectory garden, making some tiny clothes, with soft hope in her eyes and gladness. And because she was happy, so was I; and they all thought, as they should, that I was not much the worse for my loss. So I came out to Melbourne, and let time and hard work soften it down to one of those might-have-beens which we solitaires muse of when the pipe is alight and old faces shape in the curl of the smoke.

Sweet Elsie! She has gone her way long syne, as tender things will; but she remembered me

at the last, and sent me a braid of her hair, with a sisterly word or two and a blessing, to which Henry added, 'God's will be done!' And so it all came back at the sound of the fiddle; and when I asked the lady what she'd been playing, she said it was Schubert's 'Adieu de Béranger.'

THE 'REDEMPTIONERS.'

'THE cruelty of our laws against debtors, without distinction of honest or dishonest, is the shame of our nation. I am persuaded the honestest man in England, when by necessity he is compelled to break, will early fly out of the kingdom rather than submit. To stay here—this is the consequence: as soon as he breaks, he is proscribed as a criminal, and has thirty to sixty days to surrender both himself and all that he has to his creditors. If he fails to do it, he has nothing before him but the gallows, without benefit of clergy. If he surrenders, he is not sure but he shall be thrown into jail for life by the Commissioners only on pretence that they doubt his oath. What must the man do? If he carries away his effects, he is a knave, and cheats his creditors. If he stays here, he is starved in a jail, and must end his days by a lingering death.'

Thus wrote Daniel Defoe. In his time, debtors were frequently compelled, in seeking means to extricate themselves from their embarrassments, to consent to anything, if they thereby could avoid the horrors of the debtors' prison. In many cases they took advantage of a custom that, in one form or another, had the sanction of antiquity, and being generally able-bodied men, they placed themselves in the hands of some merchant or agent, who, having effected an arrangement with the creditors, took possession of the unfortunate debtors, and hurrying them to the nearest seaport, shipped them abroad, generally to Virginia or Maryland, as so much merchandise. Sometimes the dealer accompanied his cargo, in order, if possible, to obtain a better price at the end of the voyage.

Arrived at their destination, the captives—to give them their real name—were sold to any planter whose offer would recoup the agent for the sum he had expended in purchase and transit and also allow him a handsome profit. By the terms of this sale the captive was bound to serve his new master for several years, his liberty being nominally secured at the end of that period; and from the hope of redemption and deliverance thus held out to him, the term 'Redemptioner' came to be applied to these unfortunates. But any hopes that the Redemptioner might cherish of his ultimate liberation soon proved fallacious, and he found himself plunged into fresh embarrassments long before his period of servitude had expired. Charges were made upon him for clothing, for tobacco, even for the necessaries of life—charges which he had no means of meeting, however good his inclination; and too late he found that he had, in fact, become a slave, without money, without rights, and without hope. Such friends as he had were in England, and probably had forgotten him altogether; perhaps, if even they remembered him, they were without the means of assisting him.

And the chance of money reaching the individual for whom it was intended was in those days very small. Pacific railways and 'ocean greyhounds' were unknown in the 'good old times,' and communication was slow and insecure.

Some of these Redemptioners were of course more fortunate than others, and had friends and connections more powerful and more kindly disposed, and such often ultimately obtained their freedom. But these were the exception, and not the rule, and, generally speaking, the unhappy victim laboured on from year to year, his 'redemption' receding farther and farther into the distance, till at last death put an end to his sufferings.

The dealers and merchants who carried on this shameful traffic combined the functions of the modern debt collector and the emigration agent, and traded chiefly from Belfast and Londonderry to Maryland and Virginia, though there also was a brisk trade done from Holland and Germany to the above-named colonies. These dealers were usually known as 'White Guinea Men.' They had often heavy losses, arising from the crowded state of the vessels in which the captives were conveyed; but the gains were very large, and the traffic consequently continued to flourish. On one occasion, in 1793, the yellow fever broke out in Baltimore, and no domestic servants or 'helps' could be obtained, owing to the very natural and prevalent dread of the disease. But a 'White Guinea Man' arriving from Germany, and hearing of the 'plague,' and also that no nurses were to be had in the city, conceived the idea of doing a good stroke of business, and at the same time getting rid of his cargo of Redemptioners and other deluded and trepanned emigrants. Sailing up to the city, he made known that he had 'at a good price, a few healthy servants, generally between seventeen and twenty-one years of age. Their time will be disposed of by applying on board this brig.' No doubt he reaped an excellent harvest, but one might be pardoned for hoping that he himself did not escape without a touch of 'Yellow Jack.'

The Redemptioners proper were, of course, not the only unfortunates who wore out hope and life upon the plantations of Virginia and Maryland. There were also the victims of the nefarious 'kidnappers,' men who amassed money through the credulity of intending emigrants, especially of those of the poorer class, to whom the country to which they were bound was veritably 'an unknown land.'

We have not quite rid ourselves of this species of kidnappers in these days, if we may judge by occasional revelations in police courts with regard to some emigration agents; and it will be readily understood that if such deceptions and frauds are possible now, they could be practised much more readily then.

These kidnappers had their regularly-appointed agents and offices, and a contemporary writer refers to these as follows: 'That house which they there are entering is an office where servants for the plantations bind themselves to be miserable as long as they live, without a special Providence prevents it. These fine fellows, who look like footmen upon a holiday, crept into cast suits of their masters', that want quality with deportment answerable to their apparel, are

kidnappers who walk the 'Change and other parts of the town in order to seduce people who want services, and young folks crost in love, and under an unsuccessful mind to go beyond the seas, getting so much a head of masters of ships and merchants who go over for every wretch they trepan into this misery.'

Others, too, there were among these 'white slaves' sharing their hard fate and fare, their desperate and hopeless condition, men who had been in their time in a good social position in England, but who, by some strange and unexpected reverse of fortune, an unsuccessful conspiracy, a lost battle, had been placed at the mercy of the ruling powers. Nor these alone; many others, upon whom sentence had been passed, found themselves doomed to the life-long misery of the plantations; and the gallant soldier, the desperate adventurer, the deluded emigrant, the hardened criminal, all met a common fate.

There was also a regular trade in ordinary household servants, whose condition was superior to that of the Redemptioner, in that it was to some extent regulated by special enactments. Conditional servitude, indeed, under indentures or covenants, had long existed in Virginia. Men were transported there at an expense of eight pounds or so, and were sometimes sold for forty, or fifty, or even sixty pounds. The supplying of 'white servants' became a regular business; and a class of dealers arose in England, nicknamed 'Spirits,' who sought to persuade young people to embark for America as for a land of plenty. In fact, they were sold in England, to be resold in Virginia.

In the colonies, the average price, about the year 1672, for white servants bound for five years was ten pounds or so; but for negroes, twenty to twenty-five pounds. According to the Virginia State Laws, these servants, after their term had expired, could not legally leave their employment without their masters' certificate. If, however, they did so, any one harbouring them or giving them shelter was fined thirty pounds' weight of tobacco for every day and night they were so harboured.

Any pursuit after runaway servants was made at the public expense. If the master would not pay the charges, the local authorities sold or hired out the servant, when captured, to recoup themselves.

Another regulation was that no minister should marry any servants unless he had a certificate from both masters that they fully consented. If he disregarded this prohibition, and performed the ceremony, he was liable to a penalty of ten thousand pounds' weight of tobacco.

Time went by, and at last, though very gradually, public opinion in America took a healthier and a higher tone. The condition of the Redemptioner and his fellow-sufferers began to be inquired into, and in some respects ameliorated. It was enacted in Maryland, in 1817, that there should be in future an official in every port to register the apprenticeship of servants, or the engagement of Redemptioners and other emigrants. Unless drawn up and secured by this official, no agreement was considered binding. Minors were not allowed to be sold, excepting by their parents or next of kin, an exception that seems odd, to say the least of it. Certainly,

the 'incorrigible' lads and lasses of those days must have been much more readily dealt with than they are at present. There is, in fact, a *cause célèbre* upon record in the year 1743, in which one James Annesley claimed the earldom of Anglesey from his uncle, who, he alleged, had caused him to be kidnapped and sold at thirteen years of age. He gained the case and the estates, but did not press for the title, a barren honour, which the uncle continued to hold until he died.

The new regulations were in the main beneficial, though they were, of course, often evaded in various ways, chiefly by bribing the Government official. Failing this, they were now and again openly broken through.

As with the later trade in negroes, the profits were too large for the traffic to be lightly relinquished, and it was not till the beginning of the present century that it eventually died out through the spread of free emigration.

Black slavery has always had its defenders, and no doubt white servitude was not less fortunate. Yet it seems amazing that such a state of things could ever have been permitted in a civilised country, and that custom and law, both in England and America, could ever have promoted and sanctioned the institution of the Redemptioners.

CURIOUS SHOWERS.

In August last year the inhabitants of Bjelina, in Bosnia, were treated to a rather unusual meteorological phenomenon in the shape of a shower of fish which accompanied a severe thunder-storm from the north-west. The strangest part of the occurrence was that the fish were alive and resembled whittings, and that they were caught in the gutters by the children, and brought in by wondering peasants from the fields, meadows, and high-roads. Possibly, had there been scarcity in the neighbourhood, this curious shower would have been hailed as a direct intervention of Providence on behalf of the inhabitants; but, as there seems to have been no distress, there is no knowing what they thought of it, though it goes without saying that they attributed it to any cause but a natural one. As a matter of fact, the visitation, though comparatively rare, is explicable on perfectly natural grounds. The fish were undoubtedly taken up into the air by a water-spout, carried along by atmospheric currents, and dropped, as it happened, over the village of Bjelina. They had not been held 'in suspension,' so to speak, for long, because the fish were alive when they fell to the ground.

But mere distance from a large expanse of water does not count, for these fish-showers are known to have occurred many hundreds of miles away from the nearest coast. In South America, some years ago, a tract of country forty-three miles square was found thick with fish; and—to omit a host of other such instances abroad—in England on at least one occasion some pasture-land a considerable distance from the sea was found strewn with bushels of small fishes. We know ourselves of a shower of fish-bones which

fell only last year in the heart of Wales. Such showers are frequent enough at sea, and every sailor can tell of their occurrence. Mariners can also tell of showers of dust, of small animals, or of plants falling upon their vessels thousands of miles out on the ocean. These are explained on much the same principle as the fish-showers on land, with the substitution of a sandspout for a waterspout.

Mud-showers and frog-showers, of which we hear rather frequently, are caused in the same way. M. Peltier has put a frog-shower on record as having happened within his own experience. He speaks of seeing the frogs fall on the roofs of the houses, and rebound from thence on to the pavement below. A mud-shower occurred along the Union Pacific Railway at Onaga on the 4th of April 1892. The rain, we are assured, commenced early in the day, and soon the south and east sides of all the houses were covered with yellow clay. A Union Pacific train which ran through the storm had its windows covered; and the headlight was so completely plastered that the light was shut in, and the train ran in darkness into Rossville, where the mud had to be scraped off. As far east as Topeka the windows showed that the edge of the mud-storm had extended this far. It is said to have been even more severe fifty miles north-west.

Blood rain and black rain are only varieties of this phenomenon. Of the latter, we hear nothing worth speaking of nowadays; but an almost historic shower of this sort fell at Montreal in the earlier part of this century, and enveloped the then youthful city in a black pall, which must have been worse than a prime London fog, seeing that it gave the inhabitants the idea that the last day had come, or was at least on the point of coming. 'Blood' rain is caused by the presence of infinitely little plants, animalcules, or minerals in the globules. In one instance of a shower that fell at Bristol and in the Bristol Channel, the analytical examination showed that the red colour was due to ivy-berry seeds. In medieval times, blood rain was a prodigy; in the East it was connected with the belief that man was produced from blood that fell from heaven.

It was a portent as remarkable as the 'bloody host,' which, while it flourished, probably caused the death of more Jews in this country than any other individual superstition directed against that people. It is described as 'an appearance of blood flowing from bread when bitten;' but it manifested itself in other articles of food besides bread, and sometimes seemed to drop from the air. It will be remembered by historical readers that while Alexander was besieging Tyre, this prodigy and the other one of 'blood rain' occurred in one day, much to the consternation of the soldiers.

More curious than blood rain in regard to the mere colour was the red, violet, and grass-green shower which fell in the south of France many years ago, and made a patchwork of the big lake, whereon its manifestation was the more noticeable. This shower, again, was caused by untold myriads of differently-coloured animalcules.

Spider-showers are another curiosity worthy of mention in this connection. The spiders are gossamers; and all those who have read White's

Natural History of Selborne will call to mind his description of the showers he observed. One of these, he tells us, continued for nearly a whole day, and the gossamers descended from a surprising height; for when one gentleman ascended a hill near at hand, some three hundred feet high, he found that the spiders were dropping from a region in the atmosphere that was still beyond the reach of his gaze. Dr Martin Lister named this aerial spider 'the bird,' from the facility with which it can traverse the air; and upon one occasion, when he observed a shower of them at York, he ascended to the top of the Minster, and found that even at that altitude he was still below their level—that they were descending from some region above that standpoint. Darwin, another observer of spider-showers, describes one which he saw in 1832, when on board the *Beagle*, at the mouth of the La Plata River, when the vessel was some sixty miles from land; and he seems to have been the first to notice that each parachute of gossamer carried a spider *aëronaut*, for he not only observed them arrive on board the ship, but he also saw them reproduce a new parachute, and on this frail bark launch forth again 'on the bosom of the palpitating air.'

These gossamer showers are great mysteries, and once seen, cannot very readily be forgotten; for the air on these occasions becomes literally crowded with the tiny parachutes mentioned, which are composed of a few threads of almost invisible gossamer, with a small but lively spider attached. This may be regarded as the most beautiful thing in strange showers.

The most marvellous, perhaps, is manifested in the way of hail-showers—that is, if we are to take for truth all we hear of this head. There is no reason in the world to doubt the assertion that hailstones, like rain, have been known to fall from a perfectly cloudless sky. But those of little faith may very well doubt the stories that have been told about the size of the stones themselves. Bluish hailstones weighing one hundred pounds each are said, by Count de Mezeray, to have fallen in Italy in the year 1510. Hailstones 'as big as a man's fist' are almost as common as potatoes. A storm that occurred in 1809 is said to have broken over two hundred thousand panes of glass in London alone; and in Hertfordshire, another storm is reported to have caused the death of several people. Blocks of ice weighing four and a half pounds fell at Cazoria, in Spain, on June 5, 1829; and in the south of France, in October 1844, other blocks fell which turned the scale at eleven pounds.

THE CHINESE BARBER.

THE services of the *tito-yen*, or Barber, are in constant request in China, and a much more extended and complicated process is gone through than is the case at our English hair-dresser's, whose operations are generally limited to hair-cutting and clean-shaving. Having settled his customer comfortably in his chair, the Chinese barber commences by scraping, not only the cheeks and chin of his victim, but also the whole of his head, with the exception of one spot

on the top of his cranium, from which sprouts the inevitable queue; this is called by the Chinese *pient-tsi*, and by us commonly pigtail, a name much resented by the Chinaman as a vulgar and insulting designation of the 'sacred lock.' Having succeeded in shaving carefully round the pigtail, leaving the head in a bright and shining condition, resembling a well-polished billiard ball, the barber begins to perform upon his customer in a manner which can only be adequately described as 'punching his head.' This is done by clenching his fist and dealing to the long-suffering patient several sharp taps or punches with the tips of his knuckles, varied by a process of kneading or pounding, the barber digging his knuckles into the ill-fated headpiece of his customer in a most merciless fashion, suggesting that the operator is some philanthropic but fanatical phrenologist who is seeking to improve the character of his subject by altering the undulations of his skull and changing the relative positions of his 'bumps.'

The reason for these eccentric actions on the part of the Celestial barber is that his customer finds—or imagines that he finds—his brain cleared and his mind relieved; worry, care, depression, and dullness dispersed, and a feeling of lightness, brightness, and vivacity induced. As he is probably just recovering from the depressing and enervating effects of an opium stupor, with its strange and dreamful delirium, this result is not undesirable if business has to be transacted, in which, by the way, the Chinaman usually displays quite as much shrewdness and ability as our own merchant or tradesman.

After the punching and pounding process is concluded, the barber at once proceeds to unfasten and unplait the long tail of hair, which reaches to the ankles of the wearer, and having combed, brushed, and begreased it—much after the fashion of the long-tressed maiden of to-day—he, with slow and assiduous carefulness, replaits it, and ties it with a piece of black braid which hangs in two short tails at the end.

By this time one would think that sheer exhaustion would prevent the pitiless and persecuting barber from committing further atrocities upon the person of his mild and lamb-like subject; but no; renewed activity possesses the ruthless, unrelenting hair-dresser, and with frantic energy he seizes the hands of his victim, pulls his arms behind, and commences to twist and turn them until every joint cracks, and one would think that his shoulders must be dislocated. The muscles of the arms are next the objects of attack, and the kneading and pounding process is again gone through, then the fingers are bent backwards, the finger-bones crack again, and all the tortures of the rack appear to be endured.

Thus the operations of the tonsorial artist are concluded, he is duly remunerated, and the Chinaman walks lightly out of the shop, feeling

himself refreshed and invigorated; the Englishman staring with undisguised astonishment at the discovery that life still lingers in the body of his Celestial brother.

THE RETURN OF TANĒ.

[These lines are based on the customs and superstitions of the Maoris, or aboriginal race of New Zealand. They placed great faith in their native priests, who professed to divine the future, and at times to communicate with the dead. The last verse refers to the Maori custom of leaving their dead upon some mountain which was so sacred as to render any intrusion fatal. Mt. Tarawera, the scene of the dreadful eruption of 1886, was one of those holy mountains of burial, the Maoris having carried their dead there for fifteen generations.]

At the set of the sun from the pa* of Maroa

Strode TanĒ the chief.

On the red-wrathful brow of him, TanĒ the Toa,†

Like a wind-shaken leaf

Shook the huia‡ feather.

'Ye have offered me shame. Like the puia's§ fountain,

My soul surges o'er.

The pa of Maroa, the lake and the mountain

Shall know me no more

Till the earth meets the heavens!'

Loud murmured the people: 'Be eyes to our blindness,

Tuhotu the priest!

Shall TanĒ the loved one revisit in kindness,

When his anger has ceased,

The land of his fathers?'

Tuhotu the aged, who speaks the dark meaning

Of shade-dwelling dead,

Looking over his staff as he totters in leaning,

Saith, bowing the head,

'He shall, and he shall not!'

Many a moon on the pa of Maroa

Has flitted away;

And the multitude gathers, for TanĒ the Toa

Comes hither to-day,

And the breach is healed over.

But how cometh TanĒ? Slow rowers are rowing.

O'er brown neck and breast

The red blood of mourning on sharp shell is flowing:

The dark word is guessed

Of the Seer Tuhotu.

He comes to Maroa. The tempest shall whiten

His bones on the hill—

The Mountain of Dread where the forked fires lighten

Profaners to kill—

But his soul is in Reinga.||

JESSIE MACKAY.

* Pa, a fortified Maori village.

† Toa, great chief.

‡ Huia, a New Zealand pigeon, whose feathers were worn by chiefs only.

§ Puia, New Zealand geyser.

|| Reinga, the Maori heaven.

THREE FAMOUS ITALIAN BRIGANDS.

A SHORT time ago the news went abroad in Rome that in the district of Viterbo the brigand Ansuini had been captured. Surprised by a patrol of carabinieri, after a lively exchange of shots, Ansuini, dangerously wounded, had fallen into the hands of justice. Unfortunately, this news was not true. But outside of Rome many people may have asked: 'What! do brigands still exist in Italy? Are strangers right, then, when even nowadays they insert the classic episode of brigandage in the programme of a projected trip to Italy?' This romantic institution has really disappeared from Italian soil, with the exception that there still exists, and at a short distance from Rome, a species of brigandage; and perhaps it will not be unacceptable to some of your readers to hear a few particulars of the history of the three remaining Italian brigands.

Ansuini, Tiburzi, and Fioravanti are the names of the brigands actually in the exercise of their calling. The last remains of a famous race, their names enjoy in Latium and on the confines of Tuscany a certain renown and an undeniable popularity. A few years back, they had a numerous band of associates. Death and the galley have by degrees reduced their number. Domenico Tiburzi, the most formidable of the three, was a cowherd at Cellere. In 1872, at twenty-five years of age, he had his first differences with the law—a highway robbery, an extortion, and a murder. Taken and condemned to penal servitude for life, in January 1874 he escaped from the salt mines of Corneto Tarquina. From then until now he has remained at large, eluding all efforts to capture him. The forest was and is now his refuge, his kingdom; there, between Civita Vecchia and Grosseto, in the wide solitudes of the *macchia*, he has lived for twenty years, defying the spies and the rewards offered by the public authorities. To any one familiar with the nature of the *macchia* this is easily understood. The word *macchia* (scrub or bush)

is here applied to regions that are really so inaccessible as to be unexplored and utterly inexplorable, abounding in glens, ravines, and treacherous precipices, the ground covered by a dense scrubby growth, surrounded by extensive deserts, where the wild horses gallop in freedom, and the malaria reigns supreme. The brigand who knows every corner of the *macchia* lives as securely as in an unknown island surrounded by the ocean. How many times has he seen from afar the glitter of the bayonets! How many times have the carabinieri passed, grazing the hedge where he was lying curled up! How many times, disguised and unrecognisable, has he descended into the village, and even into Rome itself, perhaps to enjoy a little variety and buy some powder and balls!

Tiburzi, strong in his refuge and in his terrible fame, which he takes good care every now and then to renew, lives—permit the expression—as a man of honour. He does not rob; he does not steal; he does not harm any one. He levies taxes after his own fashion. The wealthy of the neighbouring districts pay him every month a fixed contribution: money, wine, bread, weapons, and tobacco. In recompense he guarantees the safety both of their lives and of their property: in short, he acts as a kind of public guardian for them in the *macchia*. The relations between the brigand and the people are of a most friendly description. The poor when destitute of food come to Tiburzi; he also gives them coin, with which he is always well provided. Do not imagine that such amicable relations exist only with the poor and uneducated country-people. It is the rich landowners who pay most willingly the tax which brings them an entire security for their rural property. But woe to the spy! Sooner or later, be it from afar or near, the terrible hand of the brigand strikes him; and an atrocious vengeance rouses the authorities, and convinces the unbelievers of the existence of the legendary brigand. In this way Tiburzi lives. Seventeen different warrants hang over him; but, excepting the first crimes, the others are all for

acts of vengeance against supposed or dreaded spies.

In these eighteen years of hiding from justice, Tiburzi had several companions; but, less skilful or less fortunate than he, they have all perished. The last were Domenico Biagini and Luciano Fioravanti. In 1889, on the 6th of August, the three together were surprised by the carabinieri; a sharp fight ensued: Biagini fell dead. The other two succeeded in escaping into the unknown parts of the *macchia*, where they disappeared like spectres. They disappeared, but vowing vengeance. They believed the spy was a certain Raphael Gabrielli, land-steward to the Marquis Guglielmo, although the carabinieri have since declared it was not true. A year after, in June 1890, Gabrielli was overlooking the working of fifty reapers on the Guglielmo estate at Pozzatelli, about three miles from the Montalbo Orbetello. At eight o'clock in the morning the reapers stopped for a few minutes to take rest and food. Two armed men suddenly issued forth from the side of the morass which bordered on the estate. One of them advanced to Gabrielli, and said to him: 'Get up and come with us.' The latter refused. The speaker seized him, and dragged him a few steps to where his companion stood ready with the pointed gun. Before that entire company of fifty persons, powerless and terrified, was the horrible deed perpetrated. 'Remember the 6th of August,' cried the avenger, as he fired two shots into the unfortunate man's brain. Tiburzi and Fioravanti reloaded their weapons, and crying, 'In this way spies are treated,' disappeared again into the morass.

Ansuini, the chief of another band of brigands, was born at Norcia, and is about forty-seven years of age. He worked first as a mason, and then as a chairmaker. He served in the 28th infantry regiment; and at the assizes of Spoleto, in 1875, he was condemned to ten years' imprisonment for theft. He underwent his term at Lecco and at Pianosa. Returning to his native district in 1885, he was, the following year, again before the assizes of Spoleto, charged with murder and highway robbery. He was condemned to death, the capital sentence was commuted to penal servitude for life, and he was transported to the penal settlement of Monte Filippa. On the night of the 9th or 10th of April 1890 he escaped in company with three other felons. At first they scoured the adjacent country, depredating, robbing, and committing numerous highway aggressions. Then, having lost in various conflicts two of his comrades, he succeeded—along with Giovanni Menichetti—in gaining his native territory, a district somewhere between Viterbo and Norcia. These two men became the terror of the country.

Ansuini is a man of medium stature, of a slight build, with chestnut hair and mild blue eyes. He can both read and write. When in prison, he was apathetic, but always exemplary in his conduct. He is not a ferocious man, such as brigands are popularly pictured; but he is instead as cunning as a fox. The escape from the settlement was due to his astuteness; the turnkeys say it was a real masterpiece of cunning. His was the head that planned; Menichetti's, the arm that executed. Menichetti, whom report paints as having been a man of a violent and

sanguinary disposition, was killed in June 1891, in the morass of San Magno, during an encounter in which also a brave brigadier of carabinieri lost his life. From that time Ansuini has lived alone. He also, like Tiburzi, organised a system of taxation, only that in his case the tax is voluntary; in other words, Ansuini, being a native of the place, always finds some one ready to supply him with food; and in case of danger, to give him a secure hiding-place. He, too, is implacable against spies.

Ansuini and Menichetti one time had plotted against a priest named Onesti of Viterbo. The plot failed, because Onesti, warned in time, was able to save himself. The bandits imagined that a certain Pasquale Signorelli had betrayed them. Shortly after, Signorelli disappeared, and his poor wife received a letter, signed by Ansuini, demanding two thousand francs for the ransom of her husband. The woman obeyed; but no one came to claim the desired sum, and Signorelli did not reappear. Three months after, on the margin of the morass, his unburied body was found. Ansuini had left a written statement to the effect that, having punished the traitor as he merited, he had no need of his money!

Besides these three principal brigands, in the last few years there have been others of minor importance, but fortunately they have been destroyed. The greatest contingent is always furnished by the escapes from prison; and it is easy to understand the reason why. But it is difficult to understand why these escapes are repeated so often, and above all, why prisoners are kept in the prisons of their own districts, instead of sending them to fulfil their sentences in others far distant, where it would be more difficult to escape; and even if they escaped, it would be impossible to evade pursuit. A short time since, five men succeeded in escaping almost miraculously from the works of the fort of Monte Mario. They all, except one, fell into the hands of justice, miserable, ragged, and dying with hunger, precisely because they were natives of other districts, and could not obtain any assistance from the people of the neighbourhood.

Heavy rewards are offered for the capture of the three principal brigands: ten thousand francs for whoever will deliver up Tiburzi; four thousand for Fioravanti; seven thousand for Ansuini. However, owing to the nature of the place and the peculiar system of brigandage practised up to the present time, all the efforts of the authorities have been in vain.

Many strange tales are told in connection with the adventures of these outlawed men. One day, it is narrated, a gentleman, one of the so-called tax-payers to Tiburzi, met him in the country. After the usual greetings, Tiburzi said to him: 'Oh! by the way, do you know that Spadini [the well-known Roman gunsmith] has a magnificent English repeating rifle: be kind enough to buy it for me.' The gentleman instantly promised to do so, but never thought more of the rifle or of Tiburzi, until, some considerable time after, he again encountered the latter. The thought of his forgotten promise suddenly flashed across his mind. In some trepidation, he was beginning to excuse his shortcoming, when the brigand affably anticipated him. 'Don't trouble yourself; I have already got

the gun,' he said, pointing to the weapon on his shoulder.

Another time, a company of hunters halted in a retired part of Viterbo. Whilst the supper was being prepared, a handsome man of distinguished mien came forward, and greeting the landlord, seated himself at the common table: he ate, drank, and took part in the general conversation, relating himself many spirited stories of the chase. He accompanied the hunters for a considerable distance on their way, and finally politely took leave of them. 'Who is that fine fellow?' one of the party asked the landlord. 'That is the famous Tiburzi the brigand!' he replied.

Thousands of anecdotes of this nature could be told. Contrary to the belief held by the majority of English people, the authorities, and especially the carabinieri, spare neither trouble nor risks to catch the offenders; but perhaps the proper men and the right means are not always adopted. Once, a dozen carabinieri were sent into a certain part of the country, all provided with new clothes and hats precisely similar, which ingenious disguise of course betrayed them a hundred yards off. Half an hour after their arrival, everybody in the country knew that the strangers were police in disguise. Another time, a well-known officer sent to take one of these brigands was furnished with the magnificent sum of four pounds to spend in lavish liberality!

Notwithstanding these facts, it is satisfactory to note that the conditions of public security are in a much better state than they were some years ago.

POMONA.*

CHAPTER I.

But human bodies are sic fools,
For a' their colleges and schools,
That when nae real ills perplex them,
They make enow themselves to vex them.

BURNS.

'I DON'T really see,' Dr Merridew said, scratching his head thoughtfully—'I don't really see how it is to be done this year, Sage. To be sure, there's been a lot of illness, and every one says the doctors ought to be making their fortunes; but, in my experience, it's always the poor people who are ill and require my services, while the rich go to a specialist. And then lodgings are so very expensive at this time of year, and the boys eat such quantities, bless them! at the seaside.—It is a remarkable thing,' went on the doctor, 'that just in the one point in which I could supply my family gratis—that is, medical advice—they never avail themselves of the opportunity; nor do they ever require drugs, which I could get at reasonable prices. I wouldn't mind betting, now, that bakers' children don't consume a quarter the amount of bread mine do; and butchers' families, on the same principle, are vegetarians. Such is the perversity of human nature! I think this year that, instead of going away from London, I will make up a few bottles of tonic, and they can have Tidman's Sea Salt.

Sage, who was used to her father's tirades when

holiday-time drew near, only sighed sympathetically, and went on 'larning a pair of serge knickerbockers that would be quite good enough to wear on the beach. There was so much of that sort of thing to be thought of before the annual exodus from London.' If she had not been such a contented, happy, little soul, she might have wondered sometimes if the enjoyment was worth the bother. Even Dr Merridew himself did not fully appreciate how much was demanded at these times of Sage's wise, young head and busy, little hands. He thought, after the manner of men-folk, that when he had provided the sinews of war, which, joking apart, was not by any means an easy matter, there was nothing more to be done except just to pack up their traps and be off; and he did not recognise what a difficult operation that was with four happy, healthy creatures between six and twelve, who seemed to have a special talent for wearing out knees of stockings, seats of knickerbockers, and elbows of jackets.

It was not so very long ago that Sage herself had been one of these irresponsible beings, and sometimes, I am afraid, she had thought mother unnecessarily fussy, and too much absorbed in the mending up of sea-side clothing and the packing of boxes. Sage had small arrangements of her own then that seemed to her of infinitely greater importance than sand-shoes and jerseys. Her colour-box had to be reviewed, which in moments of reckless generosity she would sometimes lend to the boys to beguile a wet afternoon or tedious recovery from a cold—a generosity which she bitterly rued when the box was returned to her in a chaotic condition. Amidst all the manifold preparations, mother always found time to remember that colour-box, and toward the girl, for somewhat unwilling help over the mending-basket, with a hardly-spared coin from her purse, and with half an hour to run off to the big artist's colour-shop, which at that time contained everything that Sage thought worth living for at that period.

Sage often tried to persuade mother to save the money expended on the serge frock and neat, little sailor hat, which were always provided for Sage herself, and let her spend it on those brushes or sketch-book or paints, that were so much better worth having; and perhaps if Sage had been Mrs Merridew's own little daughter, she might have been persuaded to let the school frock or anything do; but fond of her as she was—and no mother could have been fonder—there was still that lurking feeling that people might think she let her step-daughter go shabbier than her own, which prevented her yielding to the girl's wishes.

Among all the stock characters of fiction, I think the bad step-mother is the one least often found in real life; and certainly Sage's experience was not exceptional, and it was only by extra fondness and preference shown to her that any difference was to be seen. Perhaps it was that kindness which it has been so truly said we do not show to those we really love. There is no feeling of kindness to those we love very much; when the love is less, the need of kindness comes in: a mother is never *kind* to her child, a step-mother is.

And so Mrs Merridew was very kind to Sage—

so kind, that the motherless girl never felt for a moment the want of a mother; she never remembered or wished for anything better than the kindness that was so near akin to a mother's love. But when Sage was only fifteen, Mrs. Merridew died, and then the time of kindness and tender consideration came to an end, and Sage herself stepped into the mother's place, and had to think and care for others, and put herself and her poor little paint-box quite out of sight. She had had dreams before that of an artistic life, having certainly a facility with pencil and brush that might have been called considerable talent in more appreciative circumstances. But father was too busy, and too much disposed to depreciate himself and all his belongings in a half-joking way; and mother, dear and kind as she was, and considerate, as we have said, in regard to filling the paint-box, knew nothing at all of such things, and was inclined to look as admiringly on Kitty's rudimentary ideas of a pig, a square object with a ringlet at one end and a nob at the other; or on Will's never-ending trains with much smeared smoke, applied with the end of the finger, as on Sage's more ambitious performances.

But when mother died, darning and cutting bread and butter seemed somehow to fill the place of drawing, and small household cares to blot out day-dreams.

If Sage had been ten years older, she would have been overwhelmed with the responsibility of her position; but at fifteen there is a blessed elasticity and power of recovery that every year lessens; and though she might shed a few hot tears over account-books that would not add up right, or lie awake for a few minutes, hot and indignant, over some piece of impertinence from the servants, or imagine dreadful possibilities when the boys were late in coming home from school, the intensity of such feelings did not last long and rankle, as it would have done in later years; the tears could be dried, and the account-books laid aside and forgotten; the indignation was slept away, and did not seem half so bad next morning; and nothing ever really happened to the boys.

Then, too, father was a very reassuring court of final appeal, though she sometimes wished he would take things more seriously.

'Won't come right, eh?' he would say; 'nor do my accounts ever. I never could make two and two come to four. Why should they? I daresay they don't in the planet Mars.—How much have you got left? That's the most important thing to find out. It's a mercy I have not to send in bills with all the items, or I should not have a patient left when they discovered the weakness of my addition.—One-and-fourpence-halfpenny wrong? Phew!—a long whistle!—that's serious. I think putting it down as 'sundries' is demoralising; suppose we put it down as lost, in rather large letters. There is a virtuous feeling when one has confessed one's misdoings, and they are writ large.'

Then, again, about Mary Jane's misdemeanours; he was more amused than offended at her declaring as she weren't a 'eathen slave to clean two pair of master's boots in a day, as were that wore out as no gent didn't ought to wear them; and the last place as she was at the master wore

patent leathers and new constant—he *were* a gentleman. 'They *are* old,' he said, holding up one foot reflectively. 'Mary Jane is quite right. But they are desperately comfortable. I am not sure that I ever had a pair of patent leathers; only don't tell Mary Jane, or I might sink still lower in her estimation.'

Then, as regards anxiety over the boys, he used to laugh at Sage's grave little face, and tell her that when she had been married twice and had known what real trouble was, she would not be so inclined to forestall it by imagining what might never come to pass.

'You were the only one I was ever really anxious about, little wisdom. I had a fearful attack of indigestion when you were cutting your teeth. Nothing affects the digestion as badly as anxiety, and I developed distinct symptoms of heart disease when you had the measles, from pure agitation. It is mostly people who have no cause for anxiety who are the most anxious. The most easy-going, happy-go-lucky people are those who live on a volcano that may overwhelm them at any moment. If you come to think of it, what a silly thing anxiety is! There is no end to it, if you once begin. Only think of all the perils that surround us every time we go out, leave alone those we keep at home—infection from any one you rub shoulders with in the street, from every cab or 'bus or railway carriage—a falling chimney-pot, a runaway horse, a mad dog, even a bit of orange peel on the pavement, besides all the murderers and lunatics at large. Dear heart! one might live in a room of horrors all the time if one had the mind, without paying the extra sixpence at Madame Tussaud's.'

But at the time this story begins, Sage had had five years of housekeeping, and had attained the advanced age of twenty, and regarded herself as a very experienced person, and was so regarded also by the boys. Dr Merridew from the very first had deferred entirely to Sage, and had insisted on the boys doing the same; whatever she decided on was to be done, though sometimes his eyes would twinkle a little as he elaborately carried out a programme that was manifestly not the wisest. But this system had a very beneficial effect both as regards Sage and the boys, making her less positive and dictatorial, and them less disposed to set up their will against hers.

During these five years Sage had grown used to Dr Merridew's declaring every year the impossibility of affording a summer-holiday change, which nevertheless came to pass as regularly as the boys' holidays began; so this year she was not surprised to find, at the end of a tirade on the subject, that he had heard of a fishing village on the Dorsetshire coast which a friend of his had visited while on a walking tour, and that he had already written to ask if lodgings were to be had there.

CHAPTER II.

So, by Atlantic breezes fanned,
You roam the limits of the land,
And I in London's world abide,
Poor flotsam on the human tide.

W. WATSON.

'It's ripping!' Dennis announced authoritatively from the box as the overlaid fly laboured up

the hill and came in sight of Scar, just a cluster of thatched cottages, with yellow-washed walls, and overhanging eaves, and little wooden porches, and deep-set lattice windows, standing irregularly on either side of a steep, little village street, running down to a cleft in the cliffs, whence a steep path leads to the beach below. There were red-sailed fishing-boats drawn up on the beach; and, beyond, a wide stretch of beautiful blue dancing sea.

Dennis had had dark misgivings that Scar would prove to be one of those stuck-up fashionable places where people dressed up and walked up and down to a band; but these fears were dissipated by the first sight of the rough, little street, and the group of fishermen at the top of the path to the beach, spreading out a net to dry on the wall, while two boys were bringing up a basket heaped with beautiful shining blue and green and silver mackerel.

That first sight of Scar reassured Sage, too, of her doubts of its being worth the trouble, which this year had seemed greater than ever, the boxes being more decrepit, the family clothes less calculated for hard sea-side wear, the servants more tiresome and untrustworthy, and Dr Merri-dew himself not very well, but making light of his ailments, as he always did, and calling his headache the result of over-eating, and his weariness laziness.

'If I could only stop with you!' Sage had said regretfully that last evening. 'I shan't enjoy it a bit while you are slaving away in London; and I know you don't really think you can get away to come down even for a Sunday. I do think people might not be ill on Sundays always, or Christmas Day, or just when you most want a holiday!'

'It would be a bad job,' said Dr Merri-dew wearily, 'if people were never ill when I feel inclined for a holiday!—a bad job for our bread and butter, I mean, whatever it might be for the public at large. But when my ship comes in, and we are not obliged to think of such vulgar things as bread and butter, but have turtle soup and champagne without even ringing the bell, then you and I, Sage, will go off together for a long holiday. Where shall we go? Somewhere sunny and bright and quiet.'

'Italy,' said Sage, with great eyes fixed on this wonderful, impossible future.

'Too far,' said Dr Merri-dew. 'What do you say to Hampstead?—There,' he added, 'that is just how your mother looked when I said something provoking, and pulled up our day-dreams short.'

It was only when Dr Merri-dew was tired or out of sorts that he talked to Sage of her mother and the short romance of his life, which twenty years of hard practical work, and a happy but very unromantic second marriage, had by no means blotted from his heart and tender memory.

'She was younger than you are now, Sage, and I was little more than a boy. When I see the wise and prudent young people of the present day who can't afford to marry, and who put what they call their love—save the mark!—to cool on a shelf while they are waiting for means to provide a fitting establishment for the poor delicate thing, I sometimes wonder if it can be the same sort of feeling that carried me and Olive

right through and over all obstacles straight into Elysium. Not that I advocate imprudent marriages; don't so misunderstand me, Sage; I should be the last to advocate such, who see so much of the misery that usually ensues; but I am bound to confess that my case was an exception; and neither Olive nor I ever regretted what we had done for a moment, though it cost us all our friends, and her all that women as a rule care for—position and fashion and a society life. But it was very short, little Sage—only a year. But if life went on for a hundred years, all pain and grief and work and weariness, which, thank Heaven! it's not or anything like it, I would gladly live it out for the sake of that one year.'

And then, when Sage was worked up to romantic enthusiasm, with bright eyes and flushed cheeks, he would say something painfully matter of fact—propose tripe for supper, or declare he had a flea hopping about him, and perform all sorts of grotesque wriggings and gymnastics, which made her laugh in spite of herself. But she was very loth to leave him this year; and she went away convinced that she should not enjoy herself a bit, and—the weather being hot and sultry, and the train crowded, and the children fidgety—she actually arrived at Shingle, the nearest station to Scar, with a headache, an almost unheard-of complaint, happily, in that noisy household at Dalston, and with such a white little face, that a gentleman offered to help her to carry some of the multitudinous parcels that had been added one by one to supplement the luggage, as various forgotten and in-lispensible articles turned up at the last moment.

'We'll carry it, Sage. Do let us take it—it will be so jolly useful on the beach.—Look here—Nigel hasn't anything to carry except his boat and the cricket things; he'll manage it.'

And so he did for the first ten minutes; but after that it was: 'Here, Sage, just lay hold of this for a minute while I get my knife out.'

And of course, when Shingle was reached, the whole party forgot everything but the fact of arrival, and pelted out of the train, leaving Sage to struggle with the various impedimenta.

'Oh, thank you,' Sage said to the gentleman who offered his help; 'don't trouble. The boys will carry the things.—Here, Dennis, Nigel, Will—come back directly!'

And the gentleman raised his hat and passed on with a smile at the unruly crew under the command of such a small, white, and yet determined little captain. He was a middle-aged man, with a kind, attentive face, that seemed to notice and be interested in everything, and with that particular cut, or want of cut, in his gray hair that betrays the artist; and when the fly passed him on the road between Shingle and Scar, the flyman touched his hat to him, and told Dennis that it was a painting gentleman, 'as lived up to Scar 'lil Farm and made pitchers.'

That first sight of Scar that removed Dennis's misgivings as to its being a fashionable place, also took away Sage's headache, and any doubts of its being worth the trouble, and the feeling of its being quite impossible to really enjoy anything without father.

'Don't worry your little head about me,' he

had said. 'Go away and enjoy yourself; and come back burnt as red as a lobster, if you want to be a comfort to your afflicted parent.'

She had shaken her head dolefully, feeling that loyalty demanded constant anxiety and harrowing thought; but that first sight of Scar, or perhaps it was that first breath of sea-air blowing up from that great stretch of sun-bright sea, with the refreshing smell of seaweed from the rocks left bare by the low tide, that swept away headache and anxiety; and she felt quite ashamed when she went to bed at night to remember how little she had thought of father all the evening. 'But I think he would rather I was happy.'

Scar is almost entirely inhabited by fishermen and lace-makers, many houses combining the industries, as might be known by a lobster pot at the door and a lace pillow with its bobbins in the window. Down one side of the village street ran a brisk little stream, bridged here and there by big slabs of slate; and a day or two of rain swelled it to quite a little torrent, which went rushing and tumbling down its stony bed, sweeping away the refuse of fish and cabbage stalks, which had a tendency to accumulate there in dry weather, until some public-spirited person turned to with a broom to clear the channel.

The lodgings engaged for the Merridews were about half-way down the street, and belonged to a widow, Mrs Rockett, the proprietor of the 'Black Dog,' the one little public-house of the place, opposite which modest hostelry the house was situated. The delight of the children knew no bounds when they found they were to have a regular fisherman's cottage all to themselves, with a kitchen with blue walls and a flagged floor, into which the door opened straight from the street; and with an open fireplace with a hook on which to hang the kettle; and a patchwork curtain to keep the smoke from blowing out into the room; and a black wooden settle; and a dresser, with plates and dishes of varying pattern and design displayed on it.

Behind this there was a little washhouse, out of which a very steep staircase led into the two bedrooms, whose principal furniture was two large four-post bedsteads without curtains. Washing was evidently intended to be done entirely down-stairs in the washhouse, as there was no provision made for it in the bedrooms; but Mrs Rockett prided herself on having provided elegant toilet arrangements for the young lady by having placed a very small looking-glass in the deep window of the front bedroom, with a crochet anti-macassar tastefully festooned over it.

'Mrs Rockett she know what the quality like, she do!' the admiring neighbours declared.

Mrs Rockett was a tall, stout woman, requiring a very long tape to fasten her apron where her waist was supposed to be, and with an unexpectedly soft and high voice, and a tendency to shed tears. In spite, however, of her mild manner and sentimental way of talking, she had managed to make her way as 'a widder woman left with six little steps sudden like, through her poor, dear, 'usban' missing his way on the cliff after Shingle Fair, having maybe took a drop, though temperate in his 'abits most times.'

She had kept the 'Black Dog' respectable, though it bore a bad name in old days, and Scar men were reckoned quarrelsome in their cups.

She kept a couple of cows now, and owned some of the rough cliff pasturage, and made a good deal by selling out milk—which was a luxury unknown at Scar in old times—and sending butter and cream to the Shingle market in the season. She owned, too, as I have said, the cottage opposite; and as it was empty through the death of old Joe Gash, and as his son 'as were mate on a merchantman trading with the Injies, and weren't like to be home afore Michaelmas,' Mrs Rockett placed it at the disposal of the Merridew family, supplementing old Joe's furniture with additions from her own stores, and buying one or two things from a sale at Shingle; altogether producing what to her and the neighbours appeared a very elegant effect, though she modestly apologised to Sage on her arrival for the roughness of everything, 'as ain't what you're used to, Missy, and knows myself what gentlefolks 'abits is, through having lived general, before I married my poor dear 'usban', at Mr Thompkins the draper up to Coriton; and a good master he were, though hot-tempered; and a wife as never knew what a day's 'ealth was.'

Mrs Rockett was so very discursive in her conversation, that it is difficult to record any of her utterances without being led away from the subject in hand; and that first evening, the boys thought she was never going to leave them to the enjoyment of the plentiful meal spread out on old Joe's little round table, that tipped if you rested your elbows on the edge, and led to plentiful up-settings of tea, till the peculiarity was recognised and humoured. Another table was required to accommodate the party; so another, standing considerably higher, was pulled up alongside, and both covered with the same cloth, and covered with plates of various sizes and patterns and black-handled knives and steel forks and tea-things, and a mighty tin teapot, and such a dish of lobsters as no one had ever seen, even in the big fishmonger's in the City; and a great crusty loaf; and a roll of butter that made Sage's housekeeping hair stand on end at the notion of the boys helping themselves from such an unlimited supply.

'It is just perfect here,' she wrote to Dr Merridew that evening to announce their safe arrival; 'and butter is only tenpence a pound.'

(To be continued.)

NATURE'S SANITARY AGENTS.

It is Keats who speaks of the river performing its

Priest-like task

Of pure ablution round earth's human shores.

The authors of 'The Moon'—Nasmyth and Carpenter—claim that luminary also as a scavenger for the earth. Were it not for its aid, they point out, the estuaries of our rivers would become stagnant centres of corruption. Nature's scavengers, indeed, are many, and their work interesting. Not only are physical agents, such as the foregoing and others, enlisted in the work, but organic beings, plants and animals, likewise take their share in the work of preserving the purity and health of the world. The three

agents, wind, water, and fire, are constantly at work purifying the world we live in. A hurricane, bringing destruction in its train, may yet bestow the blessing of an atmosphere purified from disease germs. Wind lifts the stagnating effluvia from the swamp, and by attenuation and oxidation deprives it of its destructive powers; the ozone-laden breeze from the ocean brings health on its wings. It is the wind, again, which gives to the ocean a part of that motion which helps to preserve its own purity and make it a purifying agency. Without motion, water is powerless; the stagnant pool is a centre of corruption. The greater motion of the ocean is due to the influence of the moon, and thus the Queen of Night becomes a cleanser of the earth as well as a lamp to lighten it in the absence of the sun.

And as the purifying effect of the tides can be traced to the moon, so that of rains and rivers may be traced to the sun. It is the sun which gives the energy to the falling raindrop and the flowing stream. By its influence, water—in the form of invisible vapour—is drawn up everywhere from land and ocean. Thus elevated, it is in a position to do work, like the raised weight of the pile-driver or a wound-up watch—it is said to have potential energy. It falls down to the earth, and collecting from the higher parts, flows down to the lowest—the ocean—in obedience to that mysterious law by which every particle in the universe attracts every other particle. Thus the dust is washed out of the atmosphere, and the refuse swept up from the surface of the earth. And the water thus poured down from the clouds to wash the earth is water in its purest form. When the chemist wishes to obtain pure water for scientific purposes, he distils it. The sun and the cold upper regions of the atmosphere form together a great apparatus for distilling the water to be used in washing the earth. Water thus set in circulation by the sun, kept in motion by wind, gravity, and lunar attraction, is our great purifier: water has become the symbol of purification.

And there is no more effective sanitary agent than fire. The ancient who made his napkin of asbestos had but to throw it into the fire when soiled, and it could not be made cleaner. And could we but build our houses of incombustible materials, the spring cleaning might be efficiently accomplished by incendiarism. London, indeed, was purified from a plague by a general conflagration. And almost the one thing which that nearly indestructible disease germ, the bacillus, cannot stand is heat.

But if heat is a great purifier, cold is no less a preserver from decay. Amid the eternal snows of the Arctic regions, the unburied carcase may lie fresh and uncorrupt for months; the flesh of the mammoth, buried in the frozen soil of Siberia, has resisted decay for untold centuries. And here, perhaps, we have one of 'nature's hints to inventors;' for meat is now largely preserved by freezing.

Electricity is also a sanitary agent. When Professor Tyndall was experimenting with atmospheric dust in his classical researches on the origin of the lowest forms of life, he found that

an electric discharge passed through a dusty atmosphere purified it, by causing the minute particles to settle. And long before these researches, it was commonly said, and believed, that a thunder-storm purified the air. Thus a scientific foundation is found for the popular belief, and the lightning flash takes its place as an accredited sanitary agent.

It was, moreover, established by the above experiments that the germs of decay, of mould, and of fermentation, are in the atmospheric dust, and that if these are kept out by a filter of cotton-wool, an organic infusion may be kept intact. Such a filter, then, to sift out the germs becomes an important agent in preserving from decay. And the above discovery, that decay depends on pre-existing germs, opens out wide fields of research in preventive methods in general science and surgery which cannot be touched upon here.

When we come to organic life, we find that almost every great division of the animal kingdom allots to some of its members the task of purification. The jackal follows the lion, and clears away the offal left by the lordly and disdainful appetite of the king of beasts ere the relics of his meal can become offensive. A taste for 'high' game is not confined to man: the wolf will disinter the buried corpse. And the partiality of rats for sewers is well known. The lofty-soaring vulture spies from afar the carcase in the desert, and ere there is time for decay, it is devoured. The carrion-crow gets its name from its carcase-eating propensities.

Fish, again, are voracious feeders, and not fastidious. In the river, the eel devours the rotting carcase; the dace seems to live by choice where the sewer enters the stream, doubtless for the sake of the diet. Among the mollusca, the carrion-eating stromb and the whelk prey on the dead bodies of fish. The garden slug is not averse to a semi-decayed leaf, and may even be seen at times to feed on a dead earthworm.

Among insects, flies and beetles may be specially mentioned. The fly lays its eggs in meat, and the young devour the rotten mass; others feed on dung. Beetles lay their eggs on the dunghill, or laboriously roll up balls of dung in which to place them; in both cases the young feed on the dung.

As an example of sanitary precautions taken for their own sake, may be mentioned the case of the bees, which cover up with wax an offensive body which cannot be removed from the hive. The great sub-kingdom to which insects belong—the Annulosa—supplies other scavengers. The earthworm feeds on decaying leaves; many crabs feed on carrion.

Thus it appears that the function of a considerable portion of the animal kingdom is, like a party of scavengers, to scour the streets and lanes of the organic world in search of the refuse and offal of the great living community; and to find, moreover, their pleasure and their reward in the work.

The great function of plants in this part of the economy of nature is to absorb the poison, in the shape of carbonic acid gas, breathed forth by animal life. Decomposing this within their tissues, they return to the atmosphere the oxygen so necessary to animal life. Decaying animal

and vegetable matter in the soil is likewise removed by them.

Thus, while one aspect of nature is that of universal change and decay, the other is that of universal restoration and purification. Wind, water, fire, electricity, and organic nature, combine to sweep, cleanse, and make pure and sweet the house we live in. But while nature thus provides for the continual purifying of his abode, the task of keeping himself clean is left to man. Hence the necessity of the frequent reiteration of that time-honoured proverb, 'Cleanliness is next to godliness,' which, perhaps, ought rather to be written, 'Cleanliness is a part of godliness.' And yet, if nature does not compel cleanliness by forcibly washing her refractory children, as she does the house they live in, she both warns and invites. It is written in plain letters which all may read that cleanliness is health and life, and that dirt is disease and death; while the flowing river and the sparkling sea both invite us to enjoy 'the purest exercise of health.' And this natural law shines forth in letters of fire as one of the fundamental truths in the spiritual world.

THE BURDEN OF ISABEL.*

CHAPTER XXXV.—'HE THAT *will* BE RICH!'
(continued).

BUT there were reasons why George did not wish cheque-books and accounts and such-like trifles to be gone into then; he therefore proposed to his father that the serious business of lunch should be entertained first, since nothing of any consequence could be done before the luncheon hour must strike. His father looked at his watch, considered that he was hungry, and not at all aware that the fate of his house might be involved in his decision, he said: 'Very well. Let it be lunch first.'

George knew his father's good-nature and his affection for himself, and he set himself to interest and amuse him with other matters than those upon which they had trenched. His father had told him that he wished to get back to town that night, so that his mother might not be unduly anxious; and he was resolved that his father should go without seeing any books. He kept him as long as he could over lunch, and entertained him as richly as the elder would permit, and when he could keep him no longer, he made a bold proposal.

'You'll only tire yourself out, dad, before your journey, if you go into these things. Why not let me go through everything by myself? One person can do a thing like that better than two.'

'The second can check the first, my lad,' said his father.

'But the first can check himself,' said George, 'by going over it a second time.'

'Well, well, my lad,' said Suffield. 'Be it as thou wilt. But check thyself carefully, and let me know th' result by to-night's post. And these speculations o' thine—let me ha' a statement o' them as soon as th' conveniently can this week.'

Mr Suffield was not so foolish as to be deceived by his son's concern for his comfort: he saw there was something the young man would rather keep from him at present, and being a soft-hearted father, he was sorry for his son, and said to himself: 'I won't be hard on th' lad. He's my only son, and if he has made a mistake he shall have the chance of putting it right before he explains.' He had intended to return to London by the 'dining' train, but finding he could catch a train immediately, he went straight-way to the station, while George returned to the office.

George set to work with energy to go through his accounts and to examine his private cheque-book—the only one to which, he thought, Daniel could have access—and tick off every cheque by the banker's passbook. He wrote to his father that night that he could not discover that Daniel had stolen anything but the plans.

Still George was uneasy, and he went about with his brows wrapped in anxiety; for he knew that his speculations in cotton, though only of a kind which he himself would call 'daring,' would probably be characterised by his father as 'reckless,' unless they were justified by their event; and their event was not yet; moreover, Gorgonio—with whom he had been the day before—was in low spirits, for prices were hanging at a very uninspiring level. But the first thing that seriously disturbed and shook him was the discovery that Tanderjee—to whom he had sent round an inquiry concerning Daniel—was 'gone away on business': his partner and compatriot could not say where! Where was the Parsee gone?—and why? He could not help thinking that his absence and Daniel's disappearance were more than a coincidence. The second disturbing thing was a piece of news that shook him like the blast of doom: it came from Gorgonio, and Gorgonio had thought it of sufficient importance to send it by a special messenger.—The steamer *Rohilla* had arrived in dock from Bombay with half that consignment of cotton on which Mr Suffield had last given Tanderjee a substantial advance; and Gorgonio and this messenger of his had gone and examined the cotton together—bale after bale—and Gorgonio regretted much to say that the cotton was rubbish!—and would not fetch two-pence a pound!—Would Mr Suffield come and see it?

'Have you seen the cotton?' asked George of the messenger.

'Yes, sir,' answered the clerk.

'And you agree with Mr Gorgonio?'

'Quite, sir.'

'And of course you have been in the habit of sampling cotton?'

'For years, sir.'

'Then,' said George, 'I don't see why I should waste precious time at present in going to the Liverpool docks to look at it. Mr Gorgonio can look after it: perhaps it will prove not to be all so bad when it is fully examined.—Has Mr Gorgonio,' he asked suddenly, 'seen anything of Mr Tanderjee lately?'

'I don't know, sir,' answered the clerk.

'You don't know, then, that he has gone away nobody knows where?'

'Has he indeed, sir? That looks bad.'

'Why does that look bad?' demanded George.

'Because this is the cotton just arrived that you favoured him with an advance for, sir; and I heard Mr Gorgonio say to-day that Mr Tanderjee would make a good thing out of it.'

'Then,' said George, 'your master suspects that, Tanderjee may have gone away?'

'Very likely he does, sir.'

The native activity and pugnacity of George's character were becoming thoroughly roused. To suspect was to be resolved. He blew through the tube by his writing-table, and a clerk appeared from the outer office. 'Are the December cheques here or at Holdsworth?'

'Here, I think, sir,' said the clerk.

He went to one of a set of drawers behind George and produced a bundle of used cheques, which he handed to George. George undid the bundle, and found that cheque for £7500 which he had given to Tanderjee—it was endorsed 'for Jamsetjee and Mookerjee, Tanderjee.' Then he took from a drawer near him his bank pass-book, and compared the date of the cheque with the date when it had been paid: the latter date was but one day later than the former. Then he turned to his clerk, who was waiting his orders. 'Take this cheque,' said he, 'round to the bank and ask the cashier to be so good as to let me know how it was paid.'

While the clerk was gone on this errand, he wrote a letter to Gorgonio, saying that he was convinced Tanderjee had wilfully committed a fraud upon him, and was evidently gone off with the proceeds; but that he was determined to find him wherever he was; and that the cotton had better be sold for what it would fetch: if it was so bad, it would not count in the market, and therefore might serve them by inducing a rise of prices; but omitting all mention of Daniel's absence and offence. The letter finished, he gave it to Gorgonio's messenger and sent him off.

His own clerk returned from the bank with the cashier's answer to his demand: The cheque for £7500 had been paid to Mr Tanderjee in fourteen Bank of England notes for £500, and £500 in gold. That was doubly suspicious. Why had he taken so large a sum in gold?—and why had he not taken the usual means of transmitting part of the amount to Bombay?—unless he had from the first intended to levant. The next thing to do was to discover whether these fourteen notes for £500 each had been changed, and—if possible—to trace them, and so—by good luck, perhaps!—come at the whereabouts of the fraudulent Tanderjee. George looked at his watch: it was too late to ask the help of the bank that day.

But he turned to and went through his papers, and set his work all in order, as if in preparation for a long absence. Then he went home in a consuming fever of impatience and resentment, with plenty of time for reflection before him. Daniel, Tanderjee, and Gorgonio!—could it be that they had all been in league to deceive and defraud him? But no! He could not believe it of Gorgonio!—his fortune was too much bound up with his own. But Daniel certainly had been hand in glove with Tanderjee, and it was probable they had gone off together. But how had Daniel managed to get at the plans to copy them? He went down to the counting-house when he had reached home and made what examination

he could. He saw—as his father had seen—clear evidence of tracing over the plans; but nothing more could he discover.

Next day he was astir betimes. Leaving orders for certain portmanteaus to be packed and to be brought into town to meet a certain train, he entered the works while the early morning bell still rang. He went round carefully and saw that all occupations were making orderly progress, and then he took the chief manager aside and said a few words to him.

'I am going to leave you in absolute charge at present, Mr Johnson. I daresay my father will come down to-morrow or the next day. That black scoundrel Trichinopoly and Tanderjee, the Parsee merchant, have played the fool with me and bolted; and I am going to find them, if I have to follow them to the other side of the world!'

'Hadrn't you better leave that to the police, Mr George?' said Mr Johnson.

'I can't leave it all to the police: besides, the police are too slow. This is between ourselves.—Good-bye, Johnson.'

When he had eaten a scrap of breakfast, he hurried into town and went directly to a telegraph office, where he wrote a message to Isabel, his affianced wife, requesting her to be at home as much as possible that day, because he *must* see her, though he could not say when. Thence he went to the bank, related his suspicion of Tanderjee, and begged them to make what inquiries they could concerning the cashing of the notes, and telegraph to him at his father's house in Rutland Gate, where he expected to be about three o'clock. He drew a hundred pounds in notes and gold, and then—after a flying visit to the office—he went to the railway station. In a minute or two he was embarked on his journey in a white heat of rage and resentment—rage and resentment against himself, as well as against others—which was scarcely to be distinguished from an intense calm.

(To be continued.)

OLD SERVIAN CUSTOMS.

A YEAR OF SUPERSTITIONS.

By GRANT MAXWELL.

WITH the smoke of the steamboats and whistle of the locomotives, many of the ancient practices and superstitions of the Slavonic races are passing away. The Servians are probably amongst the least superstitious of the peoples of South-eastern Europe; but in their villages farthest removed from the influences of Western life one may yet find much that is new to us; new because so very old. Elsewhere, I have described their chief household fêtes of Christmas, and 'Slava,' the fête-day of the family patron saint; and I now propose to follow through 'a year of superstitions' as practised in rural districts where neither the 'steam demon,' nor even the less modern 'school-house,' is yet an innovation on the 'ancient ways.'

New-year's Day is called by the Serbs the 'Little Christmas;' and the head of the roasted pig or sheep, which was the chief dish of the Christmas feast, is eaten on New-year's Day. A particular kind of cake is made for this day,

called in the cities and towns, 'St Basil's Cake'; but in the villages it is called 'the cake for the she-bear.' The evening is spent by the young people in various modes of divination, especially in forecasting their marriage future. Later on, I will describe several of these usages, which may be taken as typical of them all.

St George's Day, April 24th, is the favourite time for 'charming.' Old and young are alike addicted in some mode or other to this practice; and even the few individuals who are strong-minded, or sceptical enough not to actively employ 'charms' themselves, take great pains to prevent other persons obtaining occult influences over their persons or possessions on this day. On the eve of St George, the men make small crosses with branches of special trees, and the next day throw these crosses on all fields and vineyards as a protection against hail-storms. The maidens on the same evening gather field-flowers, some of which are dried and pulverised into snuff, as a cure for colds. Other flowers are steeped all night with branches of certain trees in water caught from the foam of a water-mill, preparatory for use in bathing next morning. Yet other flowers are formed into bouquets and used to divine which of their lovers are most sincere. Each maiden makes as many bouquets as she claims admirers, giving to each bouquet the name of an admirer. At midnight, she places these bouquets in the garden, or on the roof of her residence. Before sunrise, she hurries to see on which bouquet most dew glistens; for that bouquet will bear the name of her truest swain. Early on St George's morning all young people bathe: the young men in running water, as a safeguard against leprosy. The young women bathe in their own gardens, amidst bushes of roses, and of another shrub whose Servian name means 'lovely breath.' The girls who wish a 'white face' place their field-flowers mixture of the previous evening all night under a white rose-tree; while those who prefer rosy cheeks place theirs under a red rose for the night; and in the morning throw the mixture thus 'charmed' into their morning baths.

Maidens desiring to 'charm' otherwise lukewarm beaux select St George's Eve as the most propitious for their purpose. Making a bouquet of certain flowers, before placing it on the roof of their home, they adjure the bouquet thus: 'Oh flowers, my dear brothers, make — mad after me!'

Those who would ascertain, by the 'charm of the supper-table,' their destined husbands, put aside the first and the last crumbs of bread, bind these together with a piece of wood, and lay the whole under their pillows. The future spouse will appear in their midnight dreams; and as he may be away across the seas, the piece of wood is included in the 'charm' to serve him for a boat!

There are some less innocent 'charms' invoked on this wonderful St George's Eve. The dairy-women believe that on this night it is possible to cause, for the ensuing twelve months, the just product of their neighbour's flocks to flow into their own milk-pans; thereby not only doubling their own supply, but by the same act disabling a competitor. To effect this, the women must go before dawn, and entirely uncovered, to milk

the herds and flocks of the neighbour they hope to defraud. The farmers greatly dread this 'un-Christian charm,' and as a guard against it, smear their fences with animal manure.

In Servian towns, lamb is the usual roast for Easter Sunday; but in the country, most of the peasants do not taste lamb's meat until St George's Day.

In some Servian districts, every master of a household drives a lamb to church on this day, the lambs lying closely around the edifice while the men attend the service. A wax taper is lighted and fastened to the forehead of each lamb. At the conclusion of the service the officiating priest comes into the midst of the flock and recites a prayer for the prosperity of the pastoral pursuits of his parishioners. The lambs are then led home, killed, and roasted, their skins going as a perquisite to the priest.

The Serbs are addicted to sleep in the afternoons; but on St George's Day the most inveterate post-matutinal sleepers will manage to keep awake until nightfall, lest otherwise they should suffer from headaches all the year!

The Saturday preceding Pentecost is the chief day for remembering the dead. On this day the churchyards are filled with congregations. The priest hurries through the death registers. Mothers who have lost young children will not taste any fruit until they have distributed some amongst any children or poor people they may now meet; believing, if they do otherwise, that their own children in the other world will get no fruit there, and complain against the selfish parent who has forgotten them.

Pentecost is yet kept as a festival fully three days, although the authorities, and of late years even the Church officials, are endeavouring to lessen the period. Up to a few years ago, groups of fifteen to twenty young women in their best garments and covered with flowers, one carrying a white and red flag, another armed with a sword, passed from house to house dancing and singing mythological ballads. They were called 'The Queens' (Kraljize). But this custom can now seldom be seen, even in the most secluded hamlets.

From Easter Day to the following Sunday is the season called 'Zavetina.' Every Servian village, as a community, selects one of the days of this week to keep a peculiar festivity, going in procession with crosses and holy pictures through their cornfields and meadows, and resting before certain trees to hear prayers. These trees, growing in different portions of the village lands, are through a series of years visited on the same day in the same way. While the priests intone the prayers, all kneel, a posture the Servian peasant does not assume even in church more than twice or thrice in a year. After prayers, the parish priest and the mayor of the community renew with knives the cross which has been cut in the bark of each tree thus annually for many years. The procession moves from tree to tree, occasionally shouting loudly, 'Oh Lord, have mercy on us!' Sick persons, and especially sick children, are frequently laid on the ground, that the cross-bearers may pass over them; the peasant-women believing that such act, if it does not cure, will certainly improve the condition of the patients. Having made the round of the village lands, the

procession leaves the sacred pictures and crosses in the parish church. The household chiefs then dine together, under the presidency of the parish priest: the 'Kollivo' (baked and boiled and honeyed wheat) is served, and the Slava-cakes cut and broken in the orthodox 'Slava' methods, as this day is considered the village 'Slava.'

It is usual for Servian peasants, whenever they dine together, to forecast the future by the shoulder-bone of the roasted sheep or pig. The flat part of the bone is held to predict peace or war: if clear and white, peace; if rather dark, war. Near the upper end of the bone are some small holes, which are respectively called 'cradles' and 'graves'; and these, in various ways, are held to foreshow joy to some households and grief to others.

On the 15th of June, in some districts, all dresses and clothes are spread abroad, 'that the sun may see them.' On the eve of this day, the people generally gather a small red flower, steep it all night in holy-water, and use the water next morning as an eyewash 'to strengthen the sight.'

'St John's Day' (June 24th) is a grand anniversary for the Servian peasants; so august, that they say the sun arrests himself this day three times, out of fear and respect for the great saint. St John is peculiarly the patron of the shepherds, who, on Midsummer Eve, carry burning objects, made from the twigs and bark of a certain tree, thrice around their cattle-sheds and sheepfolds; then build large bonfires, and spend most of the night singing, springing now and again across the fires, and throwing aloft lighted branches.

The women make wreaths of a yellow field-flower called the flower of St John, and hang them on their houses. Even in Belgrade, the metropolis, can be seen on this day these wreaths adorning the fronts of many residences. In each wreath is intermixed a head of garlic, to be afterwards used in many methods of 'charming' away throat-swellings and other troublesome ailments. The maidens at this time peer in various ways into the future; such as throwing the white of freshly-laid eggs, or melted lead or wax, into shallow dishes of water, and by old, traditional rules, interpreting the forms the eggs, lead, or wax assume.

St Peter's Day (29th of June) is also a shepherds' festival. On the eve of this day, peculiar small cheeses are made, one for every member of the family, one for the parish priest, and two for the horns of the oldest sheep or cow.

St Elias's Day (July 21st) is held in great veneration, the peasants considering that lightning and thunder are under the control of this saint. They also say that St Elias and Mary Magdalene are brother and sister; and that Elias every day, for months previously, addresses Mary thus: 'Tell me, my sister, when my day comes, that I may also rejoice.' Mary always answers him: 'There are yet very many days to come and go before thy day arrives!' She deceives Elias thus until his day has passed over; because, if he knew his real day, he would keep it with such rejoicing that his lightnings and thunderings would smash the firmament and destroy the world!

From the 1st to the 15th of August the village women, and most of the men, strictly fast for 'the honour of the Madonna,' whose day is kept on the 15th with great solemnity, large crowds

congregating in and around the cloisters and churches.

Every church and cloister has a fixed, annual day—usually the day of the saint to whom the building is dedicated—on which is held what they call the Sabor, or 'the gathering.' Hundreds, in some places thousands, gather from far and near, many coming very long distances, on the evening before this festival, and sleep in fields and gardens near the church or monastery. After matins, dancing, singing, speaking, and cannon-firing continue until nightfall. Much business is transacted; flocks and herds change owners, new enterprises are inaugurated, and particularly new acquaintances formed to frequently issue in marriages. The 'Sabor' is also considered a good political school. Public affairs are freely discussed, and aspiring politicians utilise these 'gatherings' to the utmost.

Frequently, near young and joyous dancing groups, may be seen a smaller silent group of men with dimmed eyes and women weeping bitterly, because they have heard for the first time that since their last yearly meeting some valued relative or cherished friend has passed away.

Autumnal evenings are dear in the memory of every village matron. On these beautiful evenings, women of all ages, but still with the younger in the majority, meet at what they style 'Sela,' or 'sittings,' where they work together, knitting or spinning, with much singing and merriment. On these occasions the ancient crones entrust to new generations the household traditions relative to human life, and even more to the unseen life. Stories about fairies, witches, ghosts, vampires, miracles, find eager listeners; a weird or blood-curdling tale being quickly followed by some sweet sylvan song. These 'sittings' are held as long as the weather permits. When the cold winds and frosts terminate these open-air circles, the women of each household look eagerly forward to their chief winter festival, when the Baduyak logs shall blaze and scintillate on the Christmas hearth.

The Saturday prior to the 'Metrovdan' (October 26th, old style) is another of the 'Souls-days.' The churchyards are again filled with reverent villagers, the priests read the death registers and intone prayers for the dead, as on other days set apart for these solemn commemorations.

On St Barbara's Day (4th of December) a unique usage is observed. On the eve of this anniversary, a small portion of every species of grain is boiled all night in a pot over a wood-fire. Early in the morning the surface of the boiled grain is critically examined. Should the surface be uneven, it is thought a good omen; but if the surface be even, with occasional fissures, evil is prognosticated. After this investigation, a youth of the family is despatched with the pot and its contents to the river, spring, or well whence water is obtained for domestic use. He greets the water, throws into it three spoonfuls of the corn, and cries aloud: 'Oh God, give us honey and wax from flowers, dew from the heavens, grain and fruit from the earth; and of Thy mercy grant us health and joy!'

On his return home, the children and 'helpers' of the family sit down around the pot and partake of the remaining corn. This custom is called 'varize.'

The life of the Servian peasant may be crowded with superstitions, and often clouded with shadowy fears; but on the whole it is a joyous one, and much less irksome and wearisome than the existence of our Anglo-Saxon poor, so often uncertain of their to-morrow's bread.

THE MONTH:

SCIENCE AND ARTS.

IN his lecture before the Royal Geographical Society, Dr Nansen, in referring to the necessity of keeping his crew employed and amused during their long sojourn in the Polar regions, described a great many ingenious devices by which that want could be met. Many of these depended upon the electric current, and as the current cannot be obtained practically without a dynamo and steam-engine to drive it, the question of extra-fuel provision comes under consideration. Dr Nansen met the difficulty by proposing that there should be a windmill on deck, which should furnish energy to accumulators, and when wind failed, the men could operate a 'walk-mill,' which, while storing electricity, would serve a further useful purpose in giving exercise to the crew.

Messrs Blake and Franklin, of the Kansas University, have lately examined a number of Indians belonging to various tribes, with a view to find out whether colour-blindness was as prevalent among savage races as it is among more civilised peoples. The Indians examined consisted of nearly three hundred males, and about half as many females, both full and half bloods, belonging to the Pawnee, Cheyenne, and Pottawatomie tribes. The test used was Holmgren's with Berlin wool. Only three cases of colour-blindness were detected; but it was suspected, from the hesitation shown in the choice of the coloured skeins by some of the half-breeds, that in their case the sense of colour may be limited.

The progress made in alloying aluminium with other substances has (says a contemporary) brought this metal rapidly to the foreground. There seems little doubt that its future rôle will be both important and significant. It is only quite lately that the alloy of aluminium with antimony has been known. We owe this to the work of Roche, who obtained it by melting the latter metal in a Perrot's oven, stirring the melted metal with an aluminium rod. In this way the temperature being gradually increased, it was found that an alloy was formed consisting of 18.37 per cent. of aluminium and 81.63 of antimony. Unfortunately, the properties of this product showed at once that for industrial purposes it was practically of no value; so that further research was required to investigate whether, by combining it with still a third metal, more satisfactory qualities could be produced. The results seem to have been rewarded with great success.

There seems a likelihood that 'villainous salt-petre' will speedily become a thing of the past, and it is possible that many now living may see gunpowder exhibited as a curiosity in our museums. The explosive which will probably take its place in warfare is known as Cordite,

which is a compound of nitroglycerine, gun-cotton, and mineral jelly. Experiments lately carried out at the Government proof-butts at Woolwich show that in many respects cordite is superior to gunpowder. In one case, a six-inch quick-firing gun loaded with fourteen pounds of cordite was found to give a higher velocity with hardly any increase of pressure on the gun than when it was loaded with double that weight of black gunpowder. A more important point is that the new explosive causes no erosion in the gun-tube. Cordite has the appearance of long pieces of thin black or gray cord, and it is being manufactured at the Government Powder-mills at Waltham Abbey. It is not yet known whether it will keep so well as gunpowder.

Soapstone, or Steatite, which is manufactured by the Chinese into miniature pagodas and other ornaments, is found in the neighbourhood of Wen-chow, and our consul there has recently given an interesting account of the mines and the people by whom they are worked. The hills containing the mineral are owned by twenty or thirty families, who lead a hard life, living in straw huts on the hill-sides. The steatite is principally valued according to its colour, after which size and shape come next in importance. Purple, mottled-red, black, blue, and gray are all valued; but the greatest store is set upon the steatite which is perfectly white. The industry finds employment for about two thousand persons, including both miners and carvers, and a great impetus has been given to it since Wen-chow was opened up to foreign trade. Steatite is much used in the manufacture of gas-burners, for although a soft stone, it will withstand heat to a wonderful extent.

In a paper read before the Franklin Institute (Philadelphia) on the Causes of Fires, the author, Mr C. J. Hexamer, devoted some attention to the dangers arising from employing inferior petroleum for lamps, and he remarked that in order to be safe it should have a flash-test of at least one hundred and thirty degrees. By non-technical listeners this caution would not have been readily understood unless the lecturer had given directions for testing the oil by flash. As the information may be valued by others, we reproduce it. The oil can be readily tested by pouring it upon some sand in a vessel which will stand heat. A thermometer is placed in the oil, and heat is applied to the outer receptacle. At the same time an ignited taper, with the smallest possible flame, is held above the oil, but is not allowed to touch it. The temperature of the oil is accurately observed, and if the vapour from it flashes before the mercury rises to one hundred and thirty degrees, it is unfit for household use.

The 'Pioneer Mail' of India lately recorded a case which seems to indicate that there is some foundation for the common belief that if a cobra be killed and its remains are left in a bungalow, snakes of the same species will be attracted to the place. The story goes that about a year ago the occupant of a bungalow at Dinapore killed a large cobra, which was duly stuffed and set up as a trophy. Since this event no fewer than eight large cobras have been killed there, one of them being found sitting up, with hood extended, looking at the house, and the others making towards

the premises. It is a curious fact that no cobras have been seen in other parts of the station.

At the Marine Biological Laboratory at Plymouth some experiments have for the last two or three years been in progress, the object of which has been to determine whether or not the dark coloration on the upper side of flat fishes is due to the action of light. In order to settle this question, several plaice, turbot, &c., were put into tanks covered at the top, but with light reflected from below by means of mirrors. Under this treatment it was found that the white under-sides of the fish gradually became spotted, and that these spots amalgamated until the entire under-skin became dark. Photographic records have been made of these gradual changes, and the pictures are full of interest.

The 'Chemical Trades Journal' gives an interesting account of the various industrial uses of the comparatively new substance known as Silicate of Soda, or Water-glass. It is largely used in the manufacture of cheap soaps, and can be usefully employed in cleansing all kinds of articles when the action of caustic soda is too energetic, and when ordinary washing soda is not strong enough. As a case in point, the greasy cotton waste used by Continental railway companies is recovered by its aid a dozen times; while formerly, when caustic soda was employed, it could only be renewed two or three times. Silicate is also a substitute for caustic soda in the bleaching of jute and hemp waste for paper-making, and is used for waterproofing paper. It is a fixing agent for alumina and other mordants in cotton; it will render textile fabrics incombustible; it enters largely into the manufacture of artificial stones, of enamels, and paints; it is employed for rendering timber fireproof, and walls waterproof, and has many other applications in various arts and manufactures.

Lieutenant H. R. Sayce recently crossed the English Channel in a boat only eight and a half feet long, with a beam of thirty-two inches, and with a total weight of only thirty-five pounds. The little vessel was covered with canvas, which fitted tightly round the body of its adventurous occupant, but left his arms at liberty to work his paddles, his progress being further helped by a couple of small sails. The boat is apparently on the Berthon principle—that is to say, it is inflated with air, is collapsible when not in actual use, and is regarded as being unsinkable. The boat in question made its journey from Dover to Boulogne in fourteen hours.

All machinery in which cog-wheels are employed must necessarily be rather noisy, and great ingenuity has been expended in reducing the noise as much as possible. A new departure has been made by an Austrian firm by the introduction of toothed wheels made of pressed raw hides, which are designed to work in conjunction with wheels of cast-iron, steel, or other metals. The new wheels are said to be strong enough for the purpose, to require no lubricating, and to reduce vibration materially.

At the Conference recently convened by the Museums' Association at the Zoological Society's rooms, London, several papers of interest were read and discussed. Among these was one by Mr R. Newstead of Chester, 'On the Use of Boracic Acid as a Preservative for Bird-skins.'

With great confidence he commended this agent to taxidermists, and said that during the past three years he had preserved no fewer than three hundred skins with it, and had found that it was efficacious even on such large skins as those of swans and geese. He also spoke of its value as a fish-preserver.

The recent terrible collision of two war-ships, by which so many valuable lives were lost, has naturally called attention to appliances by which life may be saved under similar circumstances. Mr Adey, of the Peninsular and Oriental Company, has invented what he calls a 'Combined Ship's Buoy.' This apparatus consists of a hollow copper shell constructed with water-tight compartments, which is practically unsinkable. It is designed to be carried on a steamer's bridge, and is connected by a scout wire-cable to a revolving drum beneath the ship's deck. In case of the vessel foundering, the buoy would immediately become detached from its supports, and would when it touched the water automatically discharge rockets and blue-lights, while at the same time it would sound a bell and throw out cork-supported life-lines. Even if all these measures failed to save life the buoy would indicate the exact position of the wreck, and would therefore make salvage operations possible. The inventor will supply all particulars if he be addressed at 12 Clare Street, Bristol.

The art of refrigeration and carriage of dead-meat has now arrived at such perfection that the best brands of New Zealand mutton can hardly be distinguished even by experts from the finest Southdown. It is therefore not uncommon for the foreign meat to be sold as British, to the great profit of the trader and to the prejudice of the buyer. A Committee of the House of Lords was recently appointed to consider the question whether it would not be to the interest of honest traders and their customers that foreign meat should be marked, and it was quickly found that the chief obstacle to the proposal was an effective method of making the mark without spoiling the meat. The problem seems to have been solved by branding the meat by means of a platinum wire brought to a white-heat by electricity.

According to Professor Uffelmann of Rostock, cholera bacilli can be easily conveyed from place to place by the postman. After infecting an ordinary letter with the bacilli, he put it into a postbag, and found, after twenty-four hours, that the organisms were still living. On post-cards they remained in an active state twenty hours after infection; but they died rapidly on coins. Flies also he found were most effective carriers of cholera bacilli, an infected insect causing a piece of beef upon which it alighted to swarm with living organisms. The lesson to be learned from these experiments is that of scrupulous cleanliness. At the same time it stands to reason that unless there was some natural antidote to this wholesale dissemination of deadly organisms, human life on this earth must have long ago ceased to be.

It has been suggested that, instead of taking so much pains to stamp out cholera by quarantine restrictions, the evil should be dealt with at its point of origin. This is believed to cover a region of about eight thousand square miles at the mouth of the river Ganges, and to

be caused by the amount of animal and vegetable putrid matter which is allowed to collect in the water there. The sacred Ganges has for years untold been used as a cemetery, and the custom would possibly be difficult to eradicate; but the natives might be compelled to cremate their dead before consigning the remains to the river. It is doubtful, however, whether a disease which has travelled so far from its country of origin can be thus eradicated. The idea savours somewhat of the still prevalent notion that the best remedy against risk from dog-bite is to kill the animal which caused the injury.

Japan, says the 'Revue Géographique,' is especially rich in mineral springs of a therapeutic value, and the people are fully alive to the benefits of taking advantage of these natural remedies for various ailments. These mineral waters may be divided into four classes—sulphur, saline, alkaline, and ferruginous. In many cases the Japanese employ the water in the form of a douche, and will place themselves under cascades for the purpose. One spring which is highly valued emerges from the ground perfectly clear and limpid, almost tasteless; yet it is strongly impregnated with sulphuretted hydrogen, and soon becomes clouded and deposits sulphur. These waters are beneficial in cases of muscular and chronic rheumatism, and for certain skin diseases. Hot springs also abound in Japan, as might be expected in a country in which volcanic energy is so constantly active.

One of the most interesting relics of Old London is St John's Gate, Clerkenwell, which, because it does not happen to lie in one of the main arteries of the big city, is not so well known, even to Londoners, as it should be. It is the only remaining portion of the important Priory of St John, which dates from the fourteenth century. The old gateway has a literary interest attached to it, for in the room above the archway Dr Johnson worked for Cave the printer for a small weekly stipend; and the 'Gentleman's Magazine,' which to this day bears a picture of the archway on its cover, was first printed here. The archway had latterly become much defaced and weather-worn, but it has recently been restored as a memorial to the late Duke of Clarence, who was first Sub-prior of the Order of St John. The Order as now revived embraces the St John Ambulance Association, and is busy in other good works.

A demonstration was lately given of a new electro-cyanide process for separating gold from difficult ores—that is, ores associated with sulphur, iron oxide, antimony, &c. Hitherto, the presence of these undesirable substances has caused the mercury used for amalgamation to become dirty, or sluggish, and incapable of seizing the particles of gold brought into contact with it. In the present process, an apparatus is employed by which all difficulties seem to be surmounted by combined chemical and electrical action. It is the invention of Mr J. B. Hannay, who has devoted many years to its elaboration. By this appliance the precious metal is extracted from the ore without any preliminary treatment other than crushing. The chemicals employed are used over and over again, and the gold and silver are obtained from the amalgam at once in the

metallic state. Any workable quantity of ore may, it is said, be treated in one vessel and at one operation, and the gold obtained from it the same day. The demonstration was given by the Universal Gold Extraction Syndicate of 73 Basinghall Street, London.

Any one who has watched the operation of coaling a vessel—say a Channel steamer—with its files of men, each black as the burden which he carries, must have been struck with the waste of labour and the unnecessary dirt that the work seems to entail. In an age when so many much more difficult processes are carried out by machinery, the method seems ridiculous and clumsy. Mr M. J. Paul has invented a system of coaling by which time is saved, dirt is prevented, and a great economy of labour secured. The coal is conveyed from vessel to vessel on the dredger principle, the conveyer of the material consisting of an endless steel chain, to which is attached a number of bucket-shaped steel plates. This conveyer can be altered so as to suit the height of the ship which is being coaled, and it dips into a barge of special design by which the coal is brought within constant reach of the travelling buckets. A demonstration of the working of this new system was recently given at Rotherhithe before an assembly which included representatives of the Admiralty and of several steamship companies. On this occasion, one hundred and twenty tons of coal were embarked in seventy-five minutes, the ordinary rate of bunkering coal by manual labour being about eighty tons per day.

The results of scientific observations made during the Antarctic expedition which recently returned to Dundee are said to be of an important character, but there is much as yet to be done in collating and arranging the notes made. We are informed by the 'Dundee Advertiser,' which has published singularly comprehensive articles concerning the expedition, that Dr Donald, who acted as surgeon on board the 'Active,' had collected a large number of birds, mosses, and eggs indigenous to the Antarctic regions. Seven distinct varieties of penguins were observed, and specimens of four of these have been brought home. The other birds are very interesting to the naturalist, and are said to include at least one entirely new species. Skeletons of the different classes of seals have been preserved, and will probably be sent to the principal museums.

A CHAT ABOUT WHALES.

STEAM and the screw-propeller have lessened the whaler's dangers; but 'the fish' are apparently more shy than in the good old days, and certainly more scarce. Whales were frequently killed before they had reached maturity, and this indiscriminate destruction of old and young left unstocked grounds. Hence some of our whalers have again attempted to woo fickle fortune in the lone Southern Ocean. This is not a new departure, for many years ago Messrs Enderby established a whaling colony at the Auckland Islands, about one hundred and eighty miles south of New Zealand. Her Majesty's ship 'Havannah,' with a dozen other vessels, took live-stock and

supplies thither from England and elsewhere; and several schooners from Australia put in an appearance with various kinds of goods for sale to the workmen congregated at this out-of-the-way place. Everything was taken into consideration save the weather, which proved most inclement; and the venture failed utterly. In December 1842, Ross saw many huge whales near Darwin Islet, six hundred miles from the Falklands. They were so tame that the ship almost touched them before they would move.

Excessive estimates of a whale's bulk are met with occasionally; one measuring a hundred and fifty feet in length probably belonged to prehistoric times. Milton's words are apposite in this connection:

There leviathan,
Hugest of living creatures, on the deep,
Stretched like a promontory, sleeps or swims.

Captain David Gray of Peterhead, a mighty hunter of whales, seems to favour the more moderate view, that the average size of a full-grown Greenland whale does not exceed sixty feet. Whales, if unmolested, attain to a ripe old age; and may, for aught that is known to the contrary, become crabbed centenarians. In 1890 the crew of an American whaler, the 'Beluga,' are said to have killed a large whale in Behring Sea, in which was discovered a harpoon bearing the name of another whaleship, the 'Moctezuma,' of sixty years previously; thus proving that the whale had carried the iron with it during the threescore years. Captain David Gray once killed a very large female whale having a harpoon embedded in her blubber, which had been in position for thirty years, as evidenced by the date it bore.

A detailed description of these curious cetaceans would occupy more space than is at our disposal; but a few eventful experiences with scattered members of the family at various times will not be without interest. Sindbad the Sailor is responsible for a whale-story which, if not true, has at least the merit of being well told. Reclining motionless upon the sea-surface, this denizen of the deep was mistaken for an islet. Its grass-covered back resembled a verdant meadow, and the hardy toilers landed thereon to stretch their weary limbs after the manner of pious Æneas and his followers. Suddenly the slumbering cetacean sank beneath their feet, and great was the amazement thereat.

More reliable instances of whales confounded with rocks are not far to seek. Admiral Sir F. Beaufort ran his smart frigate into the River Plate in 1807 with studding-sails set below and aloft. An uncharted rock was reported right ahead; but sure of his position, no alteration was made in the course steered. Barnacles, breakers, and long weeds, were soon plainly observable; yet, when the ship's sails flapped with a loud noise, this supposititious rock disappeared. It was but a whale having his post-prandial forty winks. Weddell in his voyage towards the South Pole in 1822 mistook the swollen carcase of a dead whale for a half-tide rock.

It is said that the crew of an American schooner, the 'C. H. White,' had an exciting adventure not

long since on the Oregon coast. All hands save cook and captain were away in small boats halibut-fishing, when a large school of whales passed their ocean home. One of these unwelcome visitors collided with and broke the cable that held the schooner to her anchor. Becoming entangled therewith, he towed the helpless vessel in divers directions for six hours. Eventually, he succeeded in effecting his escape, and dived deeply out of sight. Something similar happened still more recently to a whale of an inquiring turn of mind. A Brazilian submarine telegraph cable was found to work badly about seventy miles from the land; and upon being hauled to the surface for repairs, the dead body of a large whale was discovered caught by the cable, which was twisted into most complicated knots.

The immense jawbones of a whale have not only served to stop a clink after decay, but also to form the gateway of a rustic garden when in good condition. The Emperor William of Germany has ordained that the bones of whales killed during his whaling expedition last summer shall be made into furniture for his boat-house at Potsdam. A German lady is to paint a description of the incidents of the chase upon the shoulder-bones of the slaughtered cetaceans, so that they may ornament the interior of the boat-house together with the numerous photographs taken during the expedition.

In January 1856 the sailing-ship 'Fusilier' was in 25 degrees north, 48 degrees west, about ten o'clock one morning, when her commander, Captain Carmichael, was surprised by a rumbling noise like that of an earthquake. The ship trembled throughout her whole length, causing the alarmed watch below to seek safety on deck without delay. This shock was repeated no fewer than a dozen times, at intervals of two minutes' duration. Soon two enormous whales appeared from beneath the ship, swam lazily about, blew several times, then went back to their retreat, and repeated the performance. It is probable that they found unalloyed satisfaction in rubbing themselves on the shells which adhered in clusters to the iron bottom of the 'Fusilier.'

In February 1875, the sailing-vessel 'Albertine,' Captain Owen, struck something considerably harder than water one foggy night while travelling five knots an hour in 42 degrees south, 75 degrees east. The officer in charge of the watch, somewhat scared, observed a line of foam on the port bow, and was about to alter her course, imagining that she had touched on an unknown shoal. Thereupon, a whale thrashed the water with his flail-like tail, snorted loudly, and sped swiftly to windward. He had doubtless been sleeping peacefully until aroused with scant ceremony by the vessel's advancing stem, and then stood not on the order of his going.

The iron barque 'Elissa,' in 1887, while crossing the South Indian Ocean, ran right into a whale. She escaped injury; but the whale fared badly, as it was afterwards seen floundering about astern in a dazed condition. An infuriated cetacean attacked the whaleship 'Essex' with fell intent, smashing in her bows, and causing her to founder. The crew took to their boats; but only a few enfeebled survivors reached the nearest land, after an awful experience of many leaden-footed hours. Strange to relate, another 'Essex' was seri-

ously damaged by a vicious whale near Zanzibar in 1887.

The steamship 'Petersburg,' of the Russian volunteer fleet, had a unique experience near Minicoy, in the South Indian Ocean. A sharp shock was felt by all on board, and she stopped, as though gripped in a vice. The sea was found to be coloured with the lifeblood of two huge whales, which lay floating in their last agony. One was cut through by the steamer's sharp stem, and the other killed by repeated blows of the screw-propeller.

The German steamship 'Waesland,' bound from Antwerp to New York, ran into and killed a sleeping whale. A smaller steamer, the 'Kelloc,' collided with a whale near Seaham Harbour, and wounded it badly. The celebrated yacht 'Genesta' narrowly avoided collision with a dead cetacean during the Jubilee race round our islands. In 1889 a Shields steamship, the 'James Turpie,' nearly cut a whale in two one starlight night. The schooner 'O. M. Marrett' was almost wrecked by passing whales in the North Atlantic. Many of the school struck her repeatedly with such violence that her whole hull shook, and articles in the officers' rooms were thrown to the floor.

In 1890 a small sailing-vessel, the 'Ocean Spray,' bound from Galveston to England, struck a sleeping whale, and received damage. On the morning of the 17th July, a whale fifty feet long made his appearance close alongside the steamship 'Port Adelaide,' Captain C. M. Hepworth, R.N.R., in 42 degrees south, 75 degrees east. He followed the vessel for four days, never more than seventy yards away, and generally close astern, much to the edification of numerous passengers. He threw up the sponge in 41 degrees south, 97 degrees east, after travelling nine hundred and eighty statute miles, certainly without resting, and apparently fasting. In November the ship 'Earnock,' Captain Parson, was under sail in 29 degrees south, 21 degrees west, when a large whale lashed the sea into foam with his tail, so near the ship that the chief officer, who happened to be below forward, came quickly on deck to see what had happened. He actually felt the impact of the water against her bows.

In June 1891, while Her Majesty's ship 'Immortalité' was steaming from Arosa Bay to Gibraltar at the rate of twelve knots an hour, she stopped short, as though a submerged danger had been located. It was presently found that she had cut deeply into a whale, and it became necessary to go astern in order to get rid of the encumbrance. Four months later, the Anchor line steamship 'Ethiopia' collided with a whale when about eight hundred miles from New York. One hour before noon, Captain Wilson and Second-officer Fife were on the bridge, and noticed this whale rise to the surface only a few feet ahead of the swiftly-moving steamship directly in her path. The 'Ethiopia,' steaming sixteen knots an hour, crushed into the cetacean, and the suddenness of the shock almost caused a panic among her passengers. She seemed to cut him completely in two, and a crimson wake was left as far as the eye could distinguish astern. In December the barque 'Rokeby Hall,' near Valparaiso, 33 degrees south, 73 degrees west, was gliding gaily along towards her port before a fair

wind, with smooth water beneath and a bright sun overhead. A whale about sixty feet long, moving in a direction at right angles to the barque's track, struck her just amidships. The 'Rokeby Hall' escaped unhurt, although the blow was dealt directly on the water-line with an awful momentum; but the whale was last seen apparently lifeless, and the water in the vicinity was red with blood. This collision may have been purely accidental, and perchance due to the unfortunate whale's defective vision.

In June 1892 the Cunard liner 'Aurania,' Captain H. Walker, passed so close to a large whale in 48 degrees north, 31 degrees west, that her stem only cleared it by a very short distance. In September the White Star liner 'Germanic,' Captain Cameron, when in 47 degrees north, 46 degrees west, cut a whale down as it lay in a deep sleep upon the sea-surface.

Man has been the relentless foe of these harmless but marketable creatures from very early days. The fearless Biscayan put forth against them in nutshell navies; larger vessels followed them still farther into the icy fastnesses adjacent to the North Pole; and steam-whalers have penetrated where not many years since Arctic discovery-ships found it difficult to reach. Propagation of the whale species was ruthlessly deemed unworthy of consideration by competing whalers, and unless the whale's shyness had increased, causing him to retreat into less accessible waters, it is not improbable that he would have become as extinct as the dodo. A close-time for whales might have some effect in counteracting the fierce greed for gold regardless of the future.

A SUMMER NIGHT IN MANIKA.

LIKE one of that all tender Sisterhood,
Who seem as angels in the fainting sight
Of wounded warriors, who have bravely stood
The charge of foemen, in the day-gone fight;
So with her star-lit cross, refreshing Night
In mantle gray steals forth, as if she would
Exhausted Nature recreate, with dreams
Of cloudy skies, cool winds, and running streams;
While spreads attendant Moon her silver light
Soft o'er the weary camp, that still and white
Now sleeps, secure, behind a guard of trees,
Kept ever wakeful by the whispering breeze,
Lest aught should find them in unwatchful mood,
Pass through their lines, and break the solitude.

THE ORANGE RIVER.

By H. A. BRYDEN.

It is a striking fact that although the Orange River has been known to the Cape Colonists for a longer period than almost any other river in South Africa, at the present time almost as little information can be gathered about it as in the early years of this century. There are, naturally, some reasons to be adduced for this strange neglect; but, considering the wonderful advances of discovery in all parts of South Africa in recent years, the impulse of the diamond-mining industry lying almost adjacent to the great stream, and the undoubted metalliferous wealth of the mountains along its course, the continued isolation of the Orange River is remarkable.

Here is a principal South African river, rising in the rugged peaks of the Quathlamba, Basutoland, flowing for twelve hundred miles before it reaches the South Atlantic, and receiving upon its passage the waters of the Vaal, the Caledon, the Nosop, Great Fish, Sea-cow, and other systems. And yet—except to cross it by railway or pontoon on his feverish rush to Kimberley, Johannesburg, or the far interior—no colonist or traveller now ever sets eyes on, or troubles his mind about this the most important stream of the Cape. At this day all that we know about this great system—the ancient Gariep of the Hottentots, the Vigita Magna of Old World cartographers, the Groote (great) Rivier of the frontier Boers—is to be gleaned from some scant pages in the Travels of Campbell (1813), Thompson (1824), Alexander (1836), and Moffat the missionary, whose interesting Travels were published in the forties. Thompson and Moffat are the only two travellers who have made their way for any considerable distance along the river-banks below the Great Falls. A few years back, Mr Farini, in his book 'Through the Kalahari Desert,' added considerably to our knowledge of these wonderful yet little-known Falls themselves. Le Vaillant, the French naturalist, in his journeys (*circa* 1784)

asserts that he crossed the Orange about that period for the purpose of hunting giraffes in Namaqualand; but an old Boer lady, who survived far into the present century, always stoutly affirmed that the 'klein Franchsman' never did pass the river; and the accounts of this volatile and amusing traveller have in other respects always to be taken with a considerable pinch of salt.

Throughout the last century, the Dutch, moving from their base round about Cape Town, slowly, as is their wont, and slowly, too, for the reason that they had to conquer savage animals, parched deserts, difficult mountain ranges, and occasionally hostile tribes, spread themselves over the present Cape Colony, and settled sparsely in remote districts. The more restless and adventurous among them, the elephant-hunters, unconsciously pioneered the way. And at last, somewhere between 1760 and 1770, one or two of these rude hunters of the wilderness, penetrating with incredible toil beyond their fellows, came suddenly upon a mighty river flowing rapidly over a broad bed towards the ocean. This 'Groote Rivier,' as they incontinently dubbed it, seemed to the wanderers to lie in a terrestrial paradise. Dense groves of giraffe-acacia, the thorny mimosa, willows, and the bastard ebony, adorned the banks; game was plentiful, and upon every hand water-fowl, guinea-fowl, and francolins were to be seen in inconceivable plenty. Upon the northern banks wandered, free and unconcerned, a stupendous quadruped utterly new to the wanderers—the tall giraffe, a creature then unknown to modern Europe—concerning which the amazed hunters took down-country with them the most marvellous accounts. Fired by this news, Colonel Gordon, an energetic Scotch officer in the service of the Batavian Government at the Cape, hurried to the north; and in 1770 himself at length setting eyes upon the Great River, named it the Orange, in honour of the hereditary Stadtholder of the Dutch Republic.

One can well imagine the keen pleasure and excitement with which these early Dutch hunters

—big, hardy men, clad in the skins of game, and armed with the immensely long flint-lock guns ('roers,' they called them) of those days—after struggling for weeks and months through a country riverless and almost waterless for the most part, first hailed the vision of this noble stream. And with what delight they must have noticed the troops of elephants, rhinoceroses, giraffes, and other great game wandering as they had wandered for ages amid the thickets, the schools of hippopotami—sea-cows, the Boers mis-call them—wallowing in the flood, the wealth of water and of grasses for their overwrought oxen and horses, and the prodigal display of flowers and flowering shrubs springing everywhere about them!

The Orange River drains an area of four hundred thousand square miles, some portions of it highly mountainous, as in its earlier course; others, as the deserts of the Kalahari to the north, and Great Bushmanland to the south, flat, or only slightly undulating. It is of course best known in the region near the junction of the Vaal River, where the busy diamond-seekers have for miles exploited its bed and banks. Perhaps it may be seen at its fairest in the neighbourhood of Aliwal North, in the more settled regions of Cape Colony, far though that village is from the river-mouth. In time of drought, the river in many places is shallow, and shows an inconsiderable volume of water; this may be especially noticed as one crosses the railway bridge on one's way to Kimberley. And although here and there, even in the dry season, fine deep reaches are to be met with, it must be confessed that as a whole the river is not, nor ever can be, a navigable one. In time of flood, when its volume is enhanced by the storm-waters of the Quathlamba, Stormbergen, Nieuwveld, and Roggeveld ranges, and the immense floods of the Vaal, Caledon, and other systems, the river rushes downwards to the sea in one mighty, roaring, yellow torrent, sometimes half a mile in width, and, crashing with inconceivable fury over the great falls of Angrabies, seeks an outlet towards ocean. And yet, strange to say, with all this effort, all this fury, its mouth will be found to be hopelessly barred by a miserable sandbank, which effectually forbids all attempts to clear an exit, except for a few days at a time, when the angry torrent raves its way through the sand and issues sheer out to sea.

From this sandbank upwards there is a stretch of water some thirty miles in extent, which is navigable for small boats. Between the Great Falls and this point run for an immense distance the so-called Gariepine Walls, enormous masses of rugged and almost inaccessible mountains, which frown above the river-course, and in many places completely hem it in, so that no man shall find his way down to the water. All around lies an inhospitable and waterless desert, so that the traveller braving the dangers of this region,

although he knows that water in plenty lies near at hand, is in danger of dying of thirst from sheer inability to make a way to the stream beneath him. This wild and precipitous region of the Gariepine Walls is practically as unexplored and unknown as it was at the beginning of the century, or indeed a thousand years ago. Except the little mission station of Pella on the southern bank, and the village of Upington, in the new district of Gordonia—part of British Bechuanaland—a little above the Great Falls, upon the northern bank, there are absolutely no settlements or villages upon the lower course of the Orange. The district of Gordonia has much improved of late years; and, thanks to an excellent system of irrigation, a fine cattle 'veldt,' and an energetic little community, shows symptoms of considerable advance. The only other inhabitants of the lower Orange are a few Korannas—a branch of the Hottentot family—Hottentots, and Bushmen, who wander hither and thither and pick up a precarious subsistence.

The larger game has now mostly disappeared from the Orange River. A few hippopotami are still found here and there below the falls; a few koodoos and hartebeests yet linger; small antelopes are plentiful; leopards and baboons abound in the mountains. Everywhere, save for the smaller mammals, reptiles, and an abundance of feathered life, is silence and desert solitude. And yet it is difficult to say why this should be so. It has been proved that much of the mountain region about the lower Orange is highly metalliferous. Iron ores, hematite, copper, crocidolite, an asbestiform mineral of considerable commercial value, argentiferous lead, and even gold, have all been found here. Copper is particularly abundant. Only thirty or forty miles south, the well-known Cape copper mines have for years turned out prodigious quantities of high-grade ore. Very beautiful garnets—red and green—agates, quartz crystals, bloodstone, amethysts, jaspers, and chalcedony, are found in the Orange or along its course. Pseudocrocidolite, a very handsome fibrous quartz, largely used for jewellery, is often abundant. Diamonds have been found at least as far down the river as Prieska, probably much below. And it seems highly probable that the beautiful gravels of the Orange must contain quantities of diamonds washed from the diamondiferous portions of the Vaal, if indeed the Orange be not itself a diamond-bearing river.

Why the Cape Colonists have not better explored their greatest river no one quite knows; probably a sparse population and the attractions of Kimberley and Johannesburg may account for the isolation and neglect of this singularly interesting region. The country is difficult of access, and toilsome in its exploration, but not insurmountably so. British folk have never yet been deterred by such obstacles. And if a small and well-equipped expedition, including in its numbers good native guides and an experienced

mining engineer, were to essay the exploitation of the lower Orange, it is pretty certain that its labours would be rewarded by some very remarkable mineral discoveries.

POMONA.*

By the Author of 'Liddle,' 'Tip Cat,' 'Lil,' &c.

CHAPTER III.

O well for the fisherman's boy
That he shouts with his sister at play;
O well for the sailor lad
That he sings in his boat on the bay.

TENNYSON.

I CANNOT help wishing, as I begin this chapter, that it were the adventures of Nigel, Dennis, and Will that I had to chronicle, and of Kitty, too, for she had her adventures as well as the boys, and went shrimping, pot-hauling, trawling, cliff-climbing, bathing, swimming, mushroom-gathering, and all the rest of it, with the best of them. She learned to pull an oar with her little brown hands; she could help to haul in a net or furl a sail; she was the pride and pet of all the fishermen. I have seen a sketch of her sitting on the end of a boat pulled up on the beach, with the peaked, red fisherman's cap she wore perched on her rough, curly, brown hair; and her short serge petticoat showing her little, bare, brown feet and ankles dangling; while below sat a group of the men mending their nets and baiting their lobster pots, and, no doubt, telling long yarns to amuse little Miss, with as much of the rough language as they could smother or swallow left out on her account. She would go lobster-catching with Lot Leach, rowing round from one large cork to another of the twenty set out dancing on the green water; and draw up the round net attached to each, with sometimes a shining lobster in his black coat of mail a captive therein.

There was a sort of fascination to Kitty in old Lot's company, and, as long as she was with him, Sage felt no anxiety as to her safety, which was not the case at first, when the children were out with some of the other men. On one occasion they were out with Ben Caster in his boat, and the wind changed so that the trawler could not get in till midnight, and Sage watched and watched on the beach, straining her eyes through the darkness, and feeling almost a hatred of the sea, that came up so gently to her feet, and then ran back, drawing the little pebbles with a coaxing deprecating sound, as if it were only a harmless, playful creature, incapable of swallowing up great ships and drowning strong men.

She was anxious, too, when the four had gone out under Cottam the coastguardman to see a smugglers' cave half-way down the cliff, which was to be reached by a somewhat break-neck scrambling path.

'Never you fear, Missy; I'll look arter 'em right enough. 'Taint nothing to be onaisy over, as long as folks keeps steady and minds what they're after.'

But Sage came across Mrs Rockett directly they were gone, who, without the least intending to frighten her, gave her such a succession of blood-curdling accounts of accidents 'on them

'orrid cliffs as lef me a widder, and my poor little ones orphings, and him with the silver watch his father give him in his pocket, and stopped at twenty minutes to eleven, as must have been the very time as he walked right over the edge; though it might have been ten minutes or so earlier, as it always were a watch as gained, and does now, as you can see it hung up over my shelf with a dint in its case where it got a knock when he fell; and Tom, my eldest boy, should 'a had it in memory like of his poor father; only his master give him one with his name and a inscription on it, after that fire at the works as I've told you of, ain't I?'

'I suppose Mr Cottam is very careful, isn't he?' Sage asked.

Mrs Rockett shook her head dubiously. 'He's the first of his family, then; for of all the keerness, feather-brained lot, them Cottams is the worst. I mind once giving Jim Cottam a pair of boots of mine to take into Shingle to get mended; and one of the neighbours came in half an hour after and says, says he: "Look what I've pick up on the road, Mrs Rockett," says he. And there was my boots where my lord had dropped 'em; and that was how I come to let Lot try his hand at cobbling; and he don't do it badly, though he takes his time over it.'

But the reader will accuse me of being given to digression as much as Mrs Rockett herself, for I was saying how much I wished that I was the chronicler of the younger Merriidews' adventures at Scar, which were many in number. But 'that,' as a great author of the present day would say, 'is another story;' and our business in hand is with Sage, who, though she was not at all above joining in some of the children's adventures, was frequently left to her own devices, and might have found it dull if she had been, like many other girls, entirely dependent for enjoyment on other people's society.

So when Sage got over her nervousness about possible mishaps befalling Kitty or the boys on the sea or shore or cliffs--and when a visit to Shingle had supplied the defects in her paint-box, which she had not had time to think of before she came away, she did not find the long August days go by at all too slowly. And she had made a friend, besides, of all the kindly Scar folk who might be reckoned as friends from the day of their arrival; and if company and talk had been what Sage wanted to make her happy, she need not have gone many paces from her own door to get plenty of it, even if Mrs Rockett, standing with arms akimbo at the door of the 'Black Dog,' had not prevented her crossing the threshold with her flow of conversation in a high-pitched voice across the street. From every doorway down the street some friendly voice called to her; she had half-a-dozen instructors in the art of lace-making.

But it was to none of these I referred when I said that Sage had made a friend for whose sake she cut Mrs Rockett's digressions short, and turned a deaf ear to the voices that hailed her from the cottage doors, and to the rattle of the bobbins, and pulled her skirt out of the fattest baby hand that sought to detain her, and hardly vouchsafed a glance at the most engaging starfish or persuasive sidelong crab, and passed, with a nod and smile, the group by the wall, and

hurried on to where a large white umbrella might be seen under the cliff some way along the beach, looking like one of those big mushroom-rooms that the children brought in from the meadows.

It was none other than 'the painter gentleman as lived up to Scar Cliff Farm and made pitch-ters,' who was Sage's friend, and who had offered his help at Shingle Station on their first arrival, when she was overwhelmed with her multifarious packages; and she made his acquaintance that very night of which mention has been made, when she was in a panic about the children who were out trawling. It was the first week of their stay at Scar, and Sage was still as anxious over the children as a hen whose ducklings have just taken to the water; and no one could persuade her that a sudden change of wind was a thing of constant occurrence, and that you are reckoning without your host if you settle the exact time at which a sailing-boat shall arrive.

As she stood on the beach, gazing out into the darkness, she began already to compose the letter by which she should make known to her father the terrible catastrophe, and worded the telegram, with that curious anxiety that creeps in even at moments of the most heart-broken anguish and grief, to keep the communication within the six-penny limit. She was leaning against one of the boats, when she heard a step coming down the shingle; and a voice, certainly not Mrs Rockett's or that of any inhabitant of Scar, said: 'I am afraid you are anxious about your brothers and the boat not coming in; but there is really no cause for uneasiness, and I could have told you when they started this morning that they might be late in coming home, as the wind was veering even then. I have been out myself all night, tacking and jacking to get in; but there's not a bit of danger; the men know every inch of the coast, and the sea is like a duckpond; and they'll take every care of the children, never fear.'

I do not suppose that Mr Ludlow knew any more about the matter than the Scar men, who had done their best to reassure her. Indeed, I expect, he knew a good deal less; but somehow there was something comforting in his voice; and it did not give the impression that he was trying to humour her and make the best of a bad business, as it did with the other men, who, she fancied—and perhaps truly—would have said the same to her if they had known that the 'Petrel' was in grievous peril. 'There! don'tee trouble, Missy; there ain't nothing to be skeered on—bless your little heart!'

Nor did he try to persuade her to go home, and urge the uselessness of straining her eyes through the darkness, as Mrs Rockett did. 'Twon't do 'em no good, poor dears. You're not taking bit nor sup since dinner;' or, 'A watched pot never boils;' they'll not come any the sooner for your looking.'

He took it for granted she would stop on the beach till the boat came in—an event which he treated not only as a certainty but a very speedy certainty; but he proposed that she should wrap herself in a warm plaid he had with him, as even on a night early in August the air is chill, and watching and waiting are not warming occupations.

'If you don't mind me having a pipe,' he said, 'and you wrap yourself in that plaid and sit down under that boat, we shall be the first to see the "Petrel" come in.'

I do not know whether it was the warmth of the plaid or the tobacco smoke that brought back in a consolatory way to her mind father's one pipe, the last thing at night, which he allowed himself as a little bit of comfort after the day's work was done; or it might have been the confidence her companion evidently felt that there was no danger to be apprehended; but Sage found herself talking quite cheerfully, and making plans for to-morrow, when no doleful sixpenny telegrams would have to be despatched, or heart-rending letters indited; and she was quite startled when a shout from the beach above announced that the 'Petrel' had been descried by eyes more used to penetrate the darkness; and she found that her thoughts had actually wandered far away from the subject which, before Mr Ludlow joined her, had seemed to absorb every sense and feeling. But she forgot all about her companion directly the boat's keel grated on the stones; for the next minute she had hold of all the four children at once, all safe and sound, all clinging hold of her, and chattering at once, and tumbling over one another, and interrupting one another in their anxiety to tell her of their adventures; and all too hungry and excited to remember what her feelings must have been, waiting for them on the dark beach.

She thought no more of her new friend till she had fed and warmed and listened to the children and got them all safe in bed, and then the plaid lying on the floor recalled him to her mind. It bore unmistakable marks of having been dragged up from the beach; and as she shook the sand and pebbles out of it and folded it up, she felt how ill-mannered and ungrateful she must have seemed not even to have said 'Good-night.'

CHAPTER IV.

Not chance of birth or place has made us friends,
Being oftentimes of different tongues and nations,
But the endeavour for the self-same ends,
With the same hopes and fears and aspirations.
LONGFELLOW.

After this very informal introduction, the acquaintance between Sage and Owen Ludlow ripened rapidly, till it reached what, I think, might almost be dignified by the name of friendship. But friendship has such different meanings to different minds, being to many people a very poor, cold-blooded, formal, convenient sort of concern, with no obligations, and few advantages, demanding no sacrifices, capable of being dropped at any moment without a pang of regret, or resumed when convenient without any perceptible feeling of pleasure. And to others it means something infinitely rich and pure and unselfish and noble, lasting till death and beyond it, patient, sympathetic, and enduring. And again some mix it up and confound it with love, and these would smile incredulously at the idea of friendship between a girl and a man, even a man with gray hair like Owen Ludlow and with fifty years behind him, with perhaps enough romance in them to last the threescore years and ten; and these will recognise the meeting on the beach as

the beginning of the love passages which occur in most stories in fiction or real life, as they will no doubt in this.

I almost wish, indeed, that it were so, for I think the course of true love might have run, very smoothly and sunnily at little Scar, and Sage have been spared some very tempestuous passages in her young life; and Ludlow might have found a pleasant, mild, autumnal happiness in a young wife.

How beautiful some of the autumn days are, with the sun shining on the many-tinted foliage, and the frosty dew in the meadows, and the calm fall of the leaves from the branches on the golden heaps on the ground! and I think Ludlow's love for Sage might have been as sweet and peaceful and fair. But to one who has known the beauty of spring with its pure, sweet, budding loveliness, with the tender green and the soft young flowers, and the love-songs of the birds, autumn's beauty never seems perfect.

And do not you know, reader, the difference between the scent of the autumn violets you pick from among the dead leaves, while a bright-eyed robin eyes you silently from the branch above; and those in the spring, that peep out under the bare hedges with such a small flower that you can hardly believe all the fragrance comes from that little scrap of blue, telling you of winter being over, and spring and hope and love and the singing of birds come?

Well, anyhow, I do not think Owen Ludlow ever could have loved any one again as he did Katharine in the spring-time of his life; and I do not think anything short of that would have been worthy to offer to Sage; so it was very fortunate that such a thing never entered the head of either of them. But when, in after-times, they went back to the beginning of their friendship, they always dated it from that night, when, I suppose, the sympathy which is the soul of friendship flashed from one heart to the other.

The next morning, while the Merridews were at breakfast—rather a late breakfast, from having been up so late the night before—Mr Ludlow came to the door with easel and all the paraphernalia for sketching over his shoulder, and looked in at the little party gathered round the two uneven tables with such a friendly eye, that Sage forgot the elaborate apologies she had prepared for her rudeness of the night before.

'Well,' he said, 'you don't look any the worse for your adventures. But I don't expect you will be off trawling again to-day, so I want you all to come up and have tea with me.—I want to show you my sketches about here,' he said to Sage, who had told him last night of her ineffectual attempts in the same direction, not realising that he was 'the painter gentleman as lived up to Scar Cliff Farm and made pitchsters,' of whom Mrs Rockett had told her a good deal.

The boys looked a little aghast at this sudden return to civilised life, and at having a jolly fine afternoon and evening spoilt while they sat up in their Sunday suits and ate thin bread and butter—or, anyhow, turned down their trousers, which at Scar were chronically tucked up to the knee—and put on clean collars; and Dennis gave a kick of much meaning under the table, nearly

succeeding in upsetting that somewhat rickety article.

Owen Ludlow rightly interpreted this demonstration, not having lost his sympathy with boys, as some men do almost before they have left school themselves.

'You had better come in all your oldest clothes,' he said, 'for they're clearing out a barn up there, and there are a heap of rats, if you like to have a hand in their destruction.'

Are there any boys in the world who do not like a rat-hunt, or fancy they should, if they had the chance?

Dennis, Nigel, and Will would have rather died than confess that their exploits in this direction had been confined to the pursuit of a mouse in the back kitchen at home; and Dennis inquired knowingly if they had any good dogs up at the farm, and proposed to borrow Mrs Rockett's dog Joe, which was as sharp as a needle, 'and well bred too,' Dennis hazarded, not knowing, as Mr Ludlow may have done, its mongrel pedigree.

'So we really met before last night,' Mr Ludlow said. 'I thought your voice was familiar to me. I have such a memory for voices, even more than for faces, and I was trying last night to fit your voice to some face I knew, and felt quite puzzled.'

'And I did not know till I had got home that you were Mr Ludlow; and Mrs Rockett said it must have been you. I don't think if I had known who it was, I should have told you about my miserable little sketches. You must have laughed at me.'

'No; that I didn't. I don't think one artist ever laughs at another; and it is so pleasant to meet any one who understands; and I came this morning on purpose to ask if you would like to come and sketch that jolly, old Scar Point. I've painted the old fellow at all times and seasons—in sunshine and shadow, storm and calm, winter and summer; and there's always something fresh to be got out of him. And, do you know? every one sees something different in him. I got quite a revelation from just a glimpse at a pencil sketch a young lady was making one day on half a sheet of note-paper. I worked for a fortnight from that idea, though I fancy she tore up the attempt in despair before she went back to Shingle; and she was voluble in her apologies for her failure, when I asked to look at it. There's such a lot of vanity mixed up in that self-depreciation!—I came here five years ago with my knapsack on my back just for a night, and I have stopped here off and on ever since. My friends harangue me on the folly of my conduct; and sometimes I return to the haunts of men and try to forget him. But the first windy night, when the wind comes with a burst and a rattle against my windows, though I may be in the most congenial company in the world, I begin to think of the spray leaping up against his rugged face, and the moonlight through the hurrying clouds playing hide-and-seek on his rough sides and noble old head. And the sunshine serves me the same trick, and allures me away from the most literary and artistic company; and I am sick for the sight of the red and gray and slate and orange that the sun brings out on him, and the green seaweed on the rocks at his feet in the silver sea,

and his cap of golden gorse, against the blue sky.—Come along, little girl, and see what you can make of him.

'Mayn't I watch how you do it?'

'No; that ends in nothing. It's like the conjurers, don't you know? who always begin their entertainment by pretending to show their audience how to do a trick. It is so simple; you have only to do as he does—just to twist up a cone of paper and shake it, and the paper flowers come dropping out, pink, blue, and green all over the place. I don't mean to say that there's any magic or even sleight-of-hand in my performances; but it's like watching conjuring to watch any one else painting, only in this case the conjurer can't instead of won't show you how he does it.'

Owen Ludlow, from living so much alone, had fallen into a way of soliloquising; and in the early days of his friendship with Sage their conversations were very one-sided; and he went wandering on a great deal more to himself than to her, going sometimes so far away from the little, grave-faced maiden at his side, that her eyes would grow round and large with bewilderment; and he would come back with a start to amused consciousness of the incongruity between his talk and its auditor.

And sometimes he would make her talk and describe all the events of her life—they were not very many, to be sure—and tell him of Dr Merriew and the hero that the shabby, hard-worked, little doctor appeared in the eyes of his young daughter; and of the life taken up with trifles, as most lives are, and full of small homely details, which, described by a loving tongue, made up a picture like a Dutch interior, which is full of charm to an appreciative eye, and yet nothing more than you can see any day in any cottage kitchen in Holland.

'You are not a bit like Kitty or the boys,' he said once, when she had been describing some episode of home-life, and he had been watching the small, delicate face lighting up with expression into a beauty which it did not really possess of itself. Kitty and the boys were all of one type, round-faced, with soft apple-colouring on their cheeks; and brown, wide-apart eyes under straight brows, that easily fell into a frown; and heavy hair without any wave or curl, shading in Kitty's case to red at the tips.

Sage's eyes were gray, with dark rings in them, and dark curled lashes; and her hair waved and curled wherever it could escape from its plaits; and her little pointed chin gave quite a different character to her face.

'I am like my mother,' she answered.

'And the others like your father, I suppose?'

'No; Nigel is a little like father, but not much. It is more in his manner than his face. No; they are like mother.'

'I don't quite understand, then,' he said, 'why you are not more alike.'

She laughed at his mystification. 'Oh,' she said, 'that is because my mother and mother are different people.' And then she told him of 'my mother,' and of her early death, and of the baby girl left to the struggling, young doctor.

'He says I was his only comfort. He doesn't often talk of those days; but when he does, he says that he doesn't think he could ever have got

over his grief when my mother went if it had not been for me. I was a horrid, fretty, little thing; but he always had me in his room at night, and sometimes he would walk up and down with me all night.—Fancy that, when he was working hard all day! He says I was a sort of counter-irritant. It's nice to have done him good, even though it was only like a mustard plaster or a blister. He had all his meals with a foot on the rocker of my cradle; and even now he says sometimes he feels after it with his foot at dinner unconsciously; and he got so used to making up medicine with me under his arm, that he only uses one hand now for things that he could do better with two.'

How different people are! Owen Ludlow thought as he listened, certainly what is one man's meat is another man's poison. 'How old are you, Sage?'

'Twenty, last May.'

'Then it was in May your mother died?'

'Yes; and they had only been married a little over a year, in the April of the year before. Father says it was such a beautiful year—there never has been one like it since. They were so poor, they could not afford to go into the country for any time; but they would go out for a day just a little way out of London; and he says there never have been such beautiful summer days as these were that year—even in Dalston it was lovely.'

'Yes,' Owen Ludlow said; 'it was my beautiful year too, little Sage. There never has been, never can be such another! How strange that two lives should have run so parallel as your father's and mine, for we must have been married the same month, and had the same length of perfect happiness allowed us.'

It was the first time he had spoken of his marriage, though he had told her many stories of his life at home and abroad before and since that time; and she listened with that sympathetic silence that is more conducive to further confidences than any expressions of interest or pity. He told her more about Katharine than he had ever told any one, bringing out one tender memory after another, over which those twenty years seemed hardly to have scattered any of time's dust, or to have faded the colours or blurred the delicate outlines.

'And you had not even a poor, little, fretting baby to be a comfort to you!' she said pitifully.

'Yes,' he said; 'even in that point your father's life and mine ran side by side; there was a little baby girl; but I'—

He stopped, with a sudden realisation of how he had cast away what might have been, what Dr Merriew had indeed found, his greatest comfort. That baby, whom he had found so uninteresting, and such an oppressive burden, would now have been a grown-up girl like this one, who sat listening with such tenderly sympathetic eyes. She might have been just such another gentle, sweet, little girl, with perhaps the likeness to her mother, the very idea of which he had scouted as applied to the baby. She might have had the same unassuming enthusiasm for art as Sage, making her as congenial and sympathetic a companion. She might have had the same loving admiration for him that Sage had for her father.

'But you lost her,' Sage softly ended the unfinished sentence.

'Yes, I lost her,' he answered, with his voice full of a deep regret, which brought sudden tears into Sage's eyes, thinking of a little grave.

THE ROYAL IRISH CONSTABULARY.

THERE are two police forces in Ireland—the Dublin Metropolitan Police, and the Royal Irish Constabulary. The former is confined altogether to Dublin and the surrounding townships, and is not unlike the city police of some of the large English towns. It has no connection with the 'R. I. C.,' as the Royal Irish Constabulary is popularly called; and the latter may be nearly altogether regarded as a rural force, the vast majority of its members being stationed in the small towns and villages—nay, even in many places where there are few or no houses at all. This police force has now been in existence for nearly seventy years; but of course great changes have taken place in it since its first establishment. It may be said to have been put on a permanent basis in the year 1837, when the existing police forces of the four provinces—till then separate and distinct—were united under one head and central control. Since then, that force has been the chief engine for maintaining the civil government of Ireland; and its duties have increased every year as new laws have been made for the better government of that country; and it now performs many duties which at its first establishment were carried out by the bailiffs, coastguards, excise officers, or by the revenue police. For instance, the R. I. C. is now employed in taking the census every tenth year—in collecting the agricultural statistics annually—in issuing and collecting voting-papers for the poor-law guardians. The inspection of weights and measures and food and drugs is now performed by members of the Force in country districts. The distribution of money, &c., for the relief of the poverty-stricken quarters in Ireland was mainly undertaken by them also. Nay, one of the last occupations which the Constabulary were set to do by the late Government was the task of distributing well-bred 'roosters' amongst the poor farmers in the backward parts of the country; and the police were enjoined not to bestow their 'charges' among the destined receivers till the latter annihilated the native cockerel.

The R. I. C. numbers at present nearly thirteen thousand strong; in peaceful times, this number is reduced to about twelve thousand. The Force is semi-military and semi-police, being equipped and drilled to a great extent in military fashion; while its duties are nearly altogether of a civil nature nowadays—though in emergencies, bodies of police may be called upon to act like portions of a regiment of soldiers. The police are armed with the Snider rifle and bayonet, and with ball-cartridge and buckshot for grave emergencies: whilst their more usual, but very often as effective weapon is the baton or truncheon. Their uniform is somewhat similar to that of the rifle regiments—dark tunic and trousers, belt and helmet or forage cap. The rank and file are all, with rare exceptions, natives of Ireland—though it is not necessary that they should be so—and are chiefly recruited from the farming class. The

majority of the officers, too, are Irishmen; but there is a fair sprinkling of Englishmen amongst them. A candidate for the R. I. C. must be of respectable parents and character—between nineteen and twenty-five years of age—not less than five feet nine inches in height, with corresponding chest measurement. He must not only be unmarried when entering the Force, but must wait for seven years before he can be allowed to marry. He must be able to read and write fairly well, and have some knowledge of arithmetic. On passing the literary and physical examination in his native county, he is put on the list of eligible candidates; and when his time comes, he is called up for training to the R. I. C. Depot in the Phoenix Park, near Dublin. Here he is drilled like a soldier, and schooled in police duties for about six months, at the termination of which he is sent out to some county to do his duty as a fully-fledged policeman. No man is allowed to serve in a county where he has any relatives or connections.

The arrangements of the Irish police differ from those of the English county police forces. Each English county has a special force of its own, unconnected with those of other counties. Ireland outside Dublin is kept in order by only one police force, and its officers and men are being constantly transferred from one county to another as the public service requires. The chief of the R. I. C. is called the Inspector-general, and there are immediately under him one Deputy and two Assistant-inspectors general, all of whom reside permanently in Dublin, where their headquarters are at the Castle. Next comes the Depot Force, at the head of which is the Commandant, and under him are an Adjutant, Barrack-master, Schoolmaster, and Surgeon. There is also a Riding-master for the instruction of the mounted portion of the Force. All these belong to the 'Staff.' There is also a Bandmaster and an excellent band, which was second to none in Ireland some years ago. At the Depot there are about two hundred and fifty men permanently stationed, forming the 'Reserve,' and about forty of these are mounted. Besides this force, there are generally about two hundred recruits there up for training. Then there are thirty-six County Inspectors, each of whom has charge of a county, or of half of the largest counties, and resides in the most central, and generally the chief town of his county. He is responsible to the Inspector-general for the discipline and efficiency of the force under his control, and to the Government for the state of his county. The county is divided according to its size into a number of portions called districts, each of which is under the charge of a District Inspector, residing in the most convenient station of his district, for the state of which he is accountable to the County Inspector, and having under his command about fifty men, scattered through the district in small parties. Each district is again subdivided into subdistricts, over each of which is stationed a Head-constable or Sergeant, in charge of from four to six or more men, according to the size and state of his 'bailiwick.' These small parties live in 'barracks,' centrally situated—generally in obscure villages, sometimes on bleak moors or mountains or such-like remote places. Each party has to look after the peace of its subdistrict, which contains all that

portion of country comprised within a circle having a circumference of about twenty to thirty miles, of which the barracks may be regarded as the centre. Besides these barracks, there are in disaffected parts of the country 'huts' inhabited by police for the special protection of persons who have for some reason rendered themselves obnoxious to their neighbours, and on whose persons or property outrages are likely to be committed. It is the duty of such police-parties to possess a good local knowledge of all the persons and places in their neighbourhood, so as to be ready to act on that knowledge at any time; they must also be acquainted with their duties as set forth in Acts of Parliament, and in rules and regulations issued from time to time from headquarters for their guidance.

The Head-constable or sergeant in charge of a party is responsible for the drill, discipline, and general efficiency of the constables under him, and also for the peace of his subdistrict. He has constantly to furnish returns and reports to his District Inspector. He has also to keep the station records and books; and as these 'office' duties are numerous and occasionally somewhat intricate, he must be possessed of some literary ability. He has also to arrange for the outdoor work of his party and to see that it is properly done. He must be capable of thinking and acting for himself in cases of emergency, when time does not admit of communicating with and receiving orders from his superiors. He must immediately visit the scene of an outrage, make inquiries, and report without delay to the District Inspector.

The first duty learned by the constable—the lowest grade of the Force—is obedience in carrying out the orders of his superiors; but, like his sergeant, he is often in a position in which he has no one from whom to receive orders, and so must act on his own responsibility. He must keep himself clean and smart in appearance; his arms and accoutrements must be always serviceable and in good order; and he must be ever ready to turn out for a sudden call of duty. He has to do his share of patrolling, execute warrants, serve summonses, attend on and carry out the orders of the magistrates, and, in short, he has to perform all the ordinary duties of a policeman anywhere.

The thorough local knowledge which a party should possess, and on which great stress is laid in selecting a good policeman, is chiefly gained by constant patrolling through the whole of a subdistrict. There are never fewer than two policemen on a patrol, and the durations and duties of patrols vary much according to those particular parts of Ireland where they are performed. The party must make themselves fully acquainted with all that is happening and going to happen in their neighbourhood; and day patrols have a good opportunity of obtaining this knowledge by mixing and conversing—nay, even 'gossiping'—with the people whom they chance to meet. Night patrols generally confine themselves to watching suspected characters and localities, and protecting obnoxious persons; and have frequently to remain in ambush in the open air for many hours, perhaps in the depth of winter, exposed to the fury of the elements in an inclement climate. Sometimes they may be sheltered

from rain and wind by a hedge, haystack, or fence—commonly called a 'ditch' in Ireland—and often they have no shelter. There are occasions, too, when such patrols have to be performed at considerable distances from the barracks, and sometimes over bogs or moors or across mountains; so that in bad weather, which is the rule rather than the exception in Ireland, they are productive of great hardship—in many cases of loss of health, and in not a few instances death has resulted from such exposure. Besides this important duty of patrolling, which averages from four to six hours daily, 'beat' duty has to be performed in towns and large villages in a manner similar to the beat duty in English towns, where the class of offences is somewhat alike.

Whenever fairs or large markets are held in towns, the police have to attend in force, to prevent rows and faction fights, which latter are now, however, dying out, though they used to be common occurrences after fairs not many years ago. Between the years 1830 and 1840 sudden tumults and daring outrages occurred in Ireland, especially in connection with the payment of tithes, and on several occasions the constabulary were brought into violent contact with the people, and very often with melancholy results to both parties. In December 1831 an officer and thirty-six men, who were protecting a process-server, were attacked in a narrow defile by the country-people, and nearly half the protecting force with their officer were murdered on the spot, the survivors narrowly escaping with their lives. Shooting at the police was not an uncommon occurrence even in recent years. In a remote part of Ireland a school Inspector was examining a class of children in Scripture, and coming to the story of Moses he asked: 'Why did Moses flee from Egypt?' None of the class could answer till he came to a little fellow at the end, who suddenly seemed struck with a brilliant idea, and piped out: 'Cos he shot a peeler, sir!' This story shows how the 'young idea' identified Moses with the flying Fenian, and the Egyptian taskmaster with the 'peeler.'

The pay of a constable in the R. I. C. varies from about a pound to twenty-seven shillings and sixpence a week, according to the number of years he has served. His pay increases on promotion; and if he attains to the rank of Head-constable, he receives about two pounds a week. There are also various allowances which amount to something in the year. An unmarried constable 'messes' with the rest of his unmarried comrades, and this 'messing' costs him about thirty-five shillings a month; and as there is, practically speaking, very little, if any, other necessary expenditure, he can, if thriftily inclined, save what is to him a considerable sum after some years' service.

The officers of the Irish constabulary are appointed partly by competition and partly by the promotion of a limited number of head-constables from the ranks. Every year the Lord-lieutenant of Ireland nominates about six gentlemen for each vacancy, and the literary examination for the vacant appointments is conducted by the Civil Service Commissioners. The candidates must be unmarried, between the ages of twenty-one and twenty-six, and over five feet six inches in height. The successful candidates

are sent to the Depot for training in drill and police duties generally; and after half a year, there, or sometimes more, they must pass a further examination before being sent down to the country to take charge of a district. Their pay and allowances then amount to about £250 per annum, and gradually rise till after about twenty years' service, when the income of a District Inspector is about £450. His promotion to the rank of County Inspector is of course accompanied by a further increase in pay.

The duties of a District Inspector are many and various, and he has no easy time in a disturbed district. He must inspect all the stations in his district once every month in the daytime, and sometimes at night. He must attend every petty sessions held in his district, where he has the conduct of all the most important criminal cases. He must visit immediately the scene of any outrage, no matter how trivial, occurring in his district: he must be on the alert with regard to occurrences likely to disturb the peace, and be ready to afford his superiors the fullest information on every matter connected with his district. He must take command of parties of his men when engaged in preserving order at races, fairs, and meetings of large numbers of people; and he has sometimes, at a moment's notice, to proceed in charge of a detachment of men to a distant part of the country, where he may be absent for weeks, or even months, as the circumstances of the case may require. He has also a fair average amount of office-work to perform daily.

Another duty that he is enjoined to perform is perhaps the most difficult of all—to 'keep in touch' with all the local magistrates. As these latter include 'all sorts and conditions' of men, who occasionally differ from one another on very trivial points, and some of whom are very often inclined to differ with the police, it is no easy task for a police-officer—especially if he has a temper—to avoid falling foul of some of 'their worships' at the local bench or elsewhere. Happy is the 'D. I.' who is able to keep on the even tenor of his way without coming into collision with any of these rustic magnates.

Though there are some unpleasant drawbacks in the life of a police-officer in Ireland, on the whole his life is pleasant, and no wonder that there are so many applications for nominations for the vacancies. He can always take part in any of the sports of the neighbourhood; and indeed in a quiet district, except for occasional routine duties and a limited income, he is like a local country gentleman. Some of them have their lines cast in very pleasant places—some in just the reverse; but there is always this consolation for the latter—that they are not likely to be long stationed in a disagreeable locality. As a rule, a police-officer is allowed to remain at a station for about five years—sometimes longer, sometimes shorter; and then, if they wish it, or if the exigences of the public service require, they may pack up their traps and seek 'fresh woods and pastures new.'

The Royal Irish Constabulary have a splendid record. In the trying times of their early establishment they encountered many difficulties nobly and successfully, and gradually won their way

into the public esteem. Their reputation is not confined to Ireland alone. Their fame has reached those regions wherever the 'Union-jack' flies, and wherever the English language is spoken. Over and over again have Irish constables, by special request, gone out to England's colonies to instruct the native police forces there, where they have risen to positions of dignity and trust, and have nobly maintained the credit of their old Force at home.

THE BURDEN OF ISABEL.*

By J. MACLAREN COBBAN, Author of *Master of His Fate*;
A Soldier and a Gentleman; &c.

CHAPTER XXXVI.—THREE INTERVIEWS.

GEORGE snatched a morsel of lunch at the bar of the Refreshment Room on his arrival at the London terminus, and then he drove to his father's at Rutland Gate. There had been a luncheon party, and the guests were driving away as George drove up. It struck three o'clock as he entered his father's house with beating heart.

'What's up, my lad?' asked Suffield, meeting his son in the hall, and glancing at the port-manteaus being handed down from the roof of the cab.

'Come, father,' said George, 'and let us talk quick.—Let these traps be left in the hall,' he said to the wondering footman: 'I don't expect to sleep here to-night.'

His father led the way into the library, and turned, saying, 'Well, my lad?'

'Let us sit down, father, together,' said George, setting his handbag on the table and taking a seat. 'I have discovered something that has made it necessary I should come to see you at once.'

'Oh,' said his father, 'you have found something at last! I thought there should be something more than the plans for Daniel to run off with.—But go on.'

'I have to confess, father, that I have been speculating largely in cotton.'

'Ha! You have!'

'I wanted to make our firm the biggest of its kind, and I wanted to make a good provision for the time when I might marry Bell.'

'You did evil, my son, and expected good to come.'

'I had read of a baker in France that developed an enormous business, because he determined not to deal with flour-agents: he imported all the flour and grain he could use, and his business grew till he had a whole fleet of ships owned by himself at work for him. "Now," I thought, "that's what we should do! We ought to import all our own cotton." I began small efforts in buying very early, though much did not happen till the beginning of the season in September. But as soon almost as I knew him, that Daniel had tempted me with his knowledge of Indian cotton, and led me on.'

Suffield groaned. 'The black man,' he murmured, 'led me on! It's an excuse, lad, as old as Adam!'

'Am I trying to excuse myself?' said George. 'I don't wish to, father. I am responsible and to blame. I only meant to show you how it all came about. Daniel was indeed very clever. He

knew all the varieties of Indian cotton, and he had picked up with a Parsee who dealt in them.—You remember Tanderjee?

'Another black man!' groaned his father. 'I wouldn't trust one o' them!'

'Tanderjee knew all about the shipments and the agents of Bombay, and between them, Daniel and he made one or two very profitable movements. But they had very little money.'

'Daniel, I suppose, would have had none at all if it hadn't been for Uncle Harry?'

'No. So Tanderjee came to me with a proposal, first, that I should help him with money and share in his profits, and afterwards, that I should advance money on consignments at a reduced price to enable them to be shipped.'

'I see it all! I see it all! It has been done before, my lad. A kind of confidence trick. They show you good samples, and get you to advance good money, and then they deliver rubbish!—Go on, my lad.'

'I advanced three-fourths once or twice. There seemed very little risk in that, you know, father. Indian cotton has for a good while shown a better average of quality than American, and it is so well packed that there is hardly any fear of damage or loss by fire or water.'

'Go on.'

'But the last time he asked me to give him a cheque, instead of making the common arrangement to be drawn upon.'

'Confidence trick again!'

'Yesterday, I was told that the first half of the consignment had arrived in dock,' George doggedly continued, 'and on examination proved not worth more than twopence a pound.'

'What had you paid for it?'

'Fivepence.'

'And for how much did you give him a cheque?'

'Seven thousand five hundred.—Now I find Tanderjee has disappeared as well as Daniel.'

'Oh, ho! He's gone, too, is he? Gone together—are they?'

'I suspect so—and gone, I should think, to Bombay. Where else should they have gone with the designs for the patent machines?'

'I've been thinking,' said his father, 'they might have been taken straight to Germany for the machines to be manufactured at once and sent on to Bombay; but there's no doubt it's Bombay the whole business is meant for.—But, now, my lad, I suppose you've come proposing to do something?'

'Find how they have gone, and follow them! That's what I propose to do.'

'Follow them yourself? Where's the good of that?'

'Not so much for the sake of the money Tanderjee has gone off with—though that's a good deal!—as because of the plans. As you have yourself said, father, they might take them to an engineer at once. However, I've been such a fool, I'm ready to defer to your opinion of what I should do.—But I've something else I must tell you first, father,' continued George with evident reluctance. 'I'm engaged now in cotton transactions along with Gorgonio.'

'What? In that cornering game of his that I've heard of?'

'Yes, father. He has no money; and I have

become responsible for the payment of differences and so on.'

'You have?—You scamp, George! You incorrigible scamp! To think that son o' mine should ever have a hand in the wickedest kind o' thing that's done in business!' He gazed at his son with an anger and sternness of demeanour the like of which his son had never seen before.

'Wickedest thing in business, father? How so?'

'Hast thought o' th' other men ruined when a corner succeeds?—o' th' mills stopped, or put on half-time, wi' forcing up prices?'

'No. I hadn't thought of these things.'

'Then,' said his father, 'it's time thou did, lad! Thou'dst better get out o' that corner at once!'

'I can't, father—until the end of the month: the transactions are open till the 31st of January!'

'Get out at once, I tell tha!—and save thy character wi' all honest men!'

'But just think what will happen! Prices will go down with a rush, and we shall lose over one hundred thousand pounds!'

'A hundred thousand! Good heavens!—But I might ha' guessed a man cannot back a cotton corner all by himself for less! But it must be done, lad, to save thy character and my own! I was an owd fool to trust tha wi' so much!—But thou hast run thy rig, and now thou'dst better go thy ways!—Thy mother and I'll ha' to go back to work and see what we can do!'

The father rose, stood with his back to the fireplace, and gazed with absent mind at the haughty lords of Padiham that glared on him from the opposite wall. The young man was thoroughly humbled. He beat his foot on the carpet, and his lip quivered.

'Don't speak to me like that, father!' said he. 'I've made a tremendous mistake, but I meant no harm!'

'I believe they a' say that, lad!—But go thy ways!'

'Here's a hundred pounds I drew to-day, father,' said George, putting his purse on the table—'to go after those black men with: don't you want me to take that? Don't you want me to go?'

'Take it; take it. A little more or less don't matter. Take it, and do as tha likes wi' it!—and go where tha likes!'

'Don't be so hard, father,' said George. 'Don't take my hope away! The bitterest thing to me is that if I don't save this, I'll have lost money that you and mother have worked hard to win! Bid me go for your sake, father! And don't burst the corner up at once, father! It will cripple your business!'

'Thou'dst best leave thy corner and thy Gorgonio to me, lad! And go and make what thou can o' thy black men!'

'I don't care for myself!' pleaded George. 'I only want to show that I can do something!—that I am fit to be trusted!' And the young man laid his face on his arm and sobbed.

'There, lad, there!' said his father, laying his hand on his son's shoulder and giving him an affectionate grip, while his lip trembled. 'Let's say no more, but make what we can o't. When a' is said and done, thou'rt my own son,

and my only one, and what's mine is thine! Come, lad, come! Let's shake hands!' And they shook hands, while the father said: 'Thou'rt not a bad lad, but thou'rt a fool, George!'

At that moment Mrs Suffield entered, and exclaimed to George: 'What's all this? I suppose your mother is of no account in the house now?'

'What dost think, Joan?' said Suffield. 'Here's our George been trying to make a cotton corner!'

'Well, and what if he has, my dear?' said his wife.

'Ah! What if he has? And what if he loses his character there, and all th' brass into th' bargain?'

'No! never!' exclaimed George's mother, kissing him. 'He's not such a bad lad!'

'Father will tell you all about it, mother,' said George seriously. 'I must run to see Isabel.'

As he went out, a telegram was handed to him. It was from his bankers. It declared that twelve of the notes whose numbers had been sent had been handed into the Bank of England and exchanged for a draft upon the Oriental Bank, Bombay, on December 27th, by a dark man who looked like a native of India.

'Daniel or Tanderjee,' said George; and returned to put the telegram into his father's hands.

Isabel sat waiting for him in a condition of great agitation. His morning telegram had assigned no reason for the hasty journey and the urgent request for an interview; so she wondered if by any means, occult or other, he had learned or divined her desire to be free of her engagement to him. When he was announced she felt herself turn pale, and when he entered and pressed her hand, she trembled so violently that George could not but note it.

'Are you ill, Bell?' he asked with concern.

'No, George,' she answered. 'But your sudden descent upon me has startled me. Is there—is there,' she asked humbly—so humbly that George was surprised at the new tone in her—'any special reason for this sudden visit?—You'll have some tea?' She rose to ring the bell—and to release her hand from his.

'I must not stay, Bell. I have come to tell you something of great consequence, and then I must be off. I have been a great fool, Bell.' (Isabel clasped her hands, and trembled afresh.) 'I have speculated in cotton very seriously; and that black Daniel and another black man have gone off—to India, I believe—with money and with other things that are of such importance that if I don't recover them—what with these and another mistake of mine—the firm will be crippled, if not ruined!'

'Oh, my poor George!' she cried. 'Take my money!—do! And make things right with it!'

'My dear Bell!' he exclaimed, rising, 'I couldn't apply a penny of your money to mend the trouble I've made by my own folly!'

'Sit down, George dear,' said she, 'and let us talk of this quietly.'

'There is no time for talk, my dear Bell!'

said George. 'My father will tell you all about it.'

'But won't you take my money?' said she almost piteously. 'The money was designed by Uncle Harry for the benefit of the family, I am sure, if the family ever needed it. He was always talking to me of our family coming first. You will take the money—won't you? I can write a cheque at once!'

'Bell, my dear, you are generosity—you are goodness itself!—but I will not touch a penny of your money! I am going to succeed, or fail, by myself in this, Bell! I want to show my father that if I make a blunder, I can try my best to repair it! And I am going to find those black villains, even if I should have to go to the other side of the world!—Do you know Ainsworth's address, Bell?'

'Mr Ainsworth's address?' echoed Isabel, beset anew with an unaccountable alarm.

'I want to ask him about that letter he wrote to me: about the condition in which he saw Daniel. I was an ungrateful fool. I believe if I had paid attention to what he wrote me, I should have been saved this trouble with Daniel!—Do you know, Bell, why I tore his letter up? I was jealous of him, Bell!'

Isabel had heard him confess almost as much before, but not so explicitly. It struck her now as if she had heard it for the first time: such a strange feeling of guilt was hanging about her heart.

'No!' she said, scarce knowing what she said, and clasping her hands to restrain herself. 'Surely not!'

'I was.—Now, give me his address, if you know it, and let me go.'

Isabel wrote the address with trembling fingers, and handed it to him, saying: 'It is the barest chance that you will find him in; though he is as likely to be at home now as at any time.—And then you are going to pursue those men. I hope you will succeed in your quest, George!—I do, indeed!' She could find nothing better—nothing more charged with feeling—than that to say: she could not belie herself.

George looked tenderly on her, and took her hand. 'Let me kiss you once, Bell, before I go.'

When he was gone, she sat down in a passion of repugnance of herself, and wrote a few lines to Ainsworth:

'My dear—George has been here. He's in great trouble. I could say nothing to him of what is in our minds. He asked me for your address. You have seen him, I hope. We had better not meet again till this is past. It is more than I can endure. I cannot humiliate myself in my own eyes. I love you, my dear; but I will not be base and snatch the pleasure of seeing you—when that pleasure makes me ashamed. Oh, let me do what I think is right and honest, and help me to do it.—Ever your own.'

Alan Ainsworth sat in his old lodgings in Woburn Place when he was surprised to hear 'Mr Suffield' announced, and amazed to see George walk in.

'I have to apologise to you, Ainsworth,' said George at once, 'for intruding on you. But I am in trouble and in haste—and I want to ask you particularly about what you wrote to me last

summer concerning that black rascal of mine, Daniel Trichinopoly.'

'Oh, you have at last found he is a rascal, then?' said Ainsworth.

'If I had listened to you, Ainsworth, that day you said you saw him in the new mill, or even later, when you wrote to me, I should have been spared the trouble. I behaved badly; I behaved like a cub; and I ask you to forgive me.'

'My dear fellow,' said Ainsworth, taking the proffered hand, 'I have nothing to forgive!—nothing!' He said that sincerely, but somewhat awkwardly; for he felt that on the whole George had much to forgive him.—'In what way, may I ask, has his rascality developed?'

George told him the story of his own folly and of Daniel's guile as briefly as he could.

'And now, I see,' said Ainsworth, 'you want to trace him?'

'To follow and catch him, please God!' said George fervently.

'Well, when I saw him,' said Ainsworth, 'he was just like one of those lascar fellows that are sailors or stokers on the Peninsular and Oriental steamers.—Was he anything of a sailor, do you know?'

'I should say, not a bit,' answered George.

'And now I think of it,' said Ainsworth, 'it must have been stoking he was dreaming of in his opium sleep. I remember perfectly—it made a great impression on me—the horror with which he talked of the fire!—the fire and the water!'

'A lascar stoker on an Indian boat!' exclaimed George. 'That's very likely. He'd think himself completely hid in that way beyond thought of detection.—But there's no time to be lost,' said he, rising.

Ainsworth insisted on accompanying him, and they went out together, Ainsworth longing to be frank and confess his love for Isabel, while he vainly felt how impossible it was to tell his companion such a thing then. They took a cab to Scotland Yard to find, or to hear of, the detective who had charge of Daniel's case. Scotland Yard had not yet discovered what had become of Daniel, and the two young men communicated their suspicion and its basis. The suspicion seemed to the official mind worth taking into account; and a detective was detailed to accompany them to the dock office of the Peninsular and Oriental Company. There, after much difficulty diving into the memory of the worried dock-agent—for he was eaten up with business, that day being the sailing day of the company—it was elicited that a lascar answering to Daniel's description, and bearing even Daniel's name, had sailed that very day at noon as a stoker in the *Travancore* in place of a defaulting lascar. Was the agent sure that was not a week ago? George asked. The agent was quite sure that none but return lascars sailed a week ago. A visit to the office of the company in Leadenhall Street added the strengthening fact that there had sailed as a second-class passenger for Bombay in the *Travancore* a Parsee, giving the name of Mookerjee.

So much success at setting out cheered George beyond measure, and he was all agog to be off in pursuit—though how a successful pursuit was to be devised he did not know, since the first port of call for the *Travancore* was Gibraltar. He had reckoned that, if the fugitives had sailed—

as they might have done—the week before, he might have caught them up by travelling overland by the mail-train to Brindisi.

'They have six hours' start of us!' exclaimed George, looking at his watch.

The detective who had accompanied them from Scotland Yard proposed that an authoritative telegram should be at once sent to the shipping agent at Gibraltar demanding the detention of one Daniel, a stoker on board of the *Travancore*; and that the other detective, who had taken charge of the case from the first, should journey with George, with warrants for the arrest of Daniel Trichinopoly and Mr Tanderjee. Then George bade 'good-bye' to Ainsworth, and went on to Rutland Gate alone.

Arrived there, he found Lord Clitheroe waiting to accompany him on whatever quest he might be going, with a portmanteau ready packed.

'I happened to look in,' said he, 'and your father told me about this business—I—he hastened to explain, in answer to a blush on George's face—'being almost one of the family. And so I made up my mind to go with you wherever you are going. It's not right for a man to go on a sport of that sort by himself.'

'It's awfully good of you,' said George gratefully, 'to think of coming.' And he related all he had discovered.

'The P. & O. boat calls at Gibraltar on Tuesday—does it not?' said Clitheroe. 'Rail at once to Marseilles, I would suggest—and then on by sea or by rail, as best we can. I think I can be of use to you on the route.'

George had a word or two with his father alone—while Phemy took the opportunity of pressing Clitheroe's hand, and murmuring, 'Aren't you a dear!' and then—with a basket of provision, which Mrs Suffield insisted they should take, because there was no time for dinner and her son had scarcely tasted food since morning—he and Lord Clitheroe drove away through darkness and fog to Charing Cross, to take the 8.15 mail-train, calling first at Scotland Yard for the detective who was to accompany them.

IN A CATHEDRAL CITY.

THROUGH a smiling land, in all its summer beauty, we reach the old cathedral city of Canterbury. From the moment in which the suburbs of London, with their endless rows of villas and patches of garden, were left behind, to that in which the lofty tower of the Cathedral came in sight, the journey has been one long succession of beautiful pictures. Pleasant valleys dotted with cattle browsing in the meadows; wooded hills with gray ivy-clad church towers peeping out here and there; hop-grounds, orchards, and corn-fields; deep cuttings of sandstone and chalk, busy towns, and picturesque villages, have followed one another swiftly. Through this pleasant country, Chaucer's pilgrims rode leisurely, more than six hundred years ago, on their way to the shrine of Thomas à Becket. Fresh towns have sprung up since then, and many of the places through which they passed have grown to six times the size they were then; but nature has not altered, and they could not have enjoyed its beauties more than

we have done. They entered Canterbury on the opposite side to that at which the traveller from Victoria alights.

Outside the station are modern houses that tell us it has outgrown its limit since those far-off times. Yet he who will may find enough traces of the old city as the pilgrims saw it. Here, for instance, not a stone's-throw from the station yard, is a part of the city wall, skirting the picturesque Dane John gardens. This wall, with many gates and towers and posterns, ran all round the city, making a thick and solid rampart. All the gates but one are gone, for the citizens of Canterbury love not what is old; much of the wall has been destroyed, and what remains has been built upon in some places and shut out from view in others; but here and there it can be seen on the northern side of the city.

Outside it stood the great monastery of St Augustine. It covered as much ground as the present cathedral and its precincts. Its abbots and priors held vast possessions, and claimed equal privilege with the sister establishment within the walls. In its church the first five Archbishops of Canterbury were buried; and until the death of Becket riveted all eyes on the cathedral, its shrines and relics were unrivalled. Of this historic place, only the outer gateway is to be seen. Until the beginning of the present century, there were the remains of a very lofty tower of beautiful workmanship, called St Ethelbert's Tower; but vandalism swept it away. Fire more than once destroyed the old monastic buildings; Henry VIII. scattered its monks and its treasures. What remained of it was by turns a fives-court, a public-house, and a brewery; so that it is little wonder that there is nothing left to-day but the gateway.

Strangely enough, while apathy, ignorance, and vandalism have united to raze to the ground this famous place, they have left untouched the church of St Martin. Perhaps its distance from the city may have had something to do with this, for it lies out beyond the monastery. But whatever the reason may be, modern pilgrims may thank a kindly fate for leaving them something genuinely old, and yet not a ruin. The church of St Martin, or at all events a part of it, was a Roman temple. It was made into a place of worship by the early Saxon Christians, and such it has remained ever since. The massive ivy-clad tower, the Roman, Norman, and Early English architecture, the ancient tomb in which the Saxon queen Bertha is said to have been buried, the wonderful font, the old brasses, the battered gravestones in the churchyard—one lingers over them all, lost in wonder, and is loth to leave them. Dean Stanley called this the Mother Church of England; and without doubt it would be hard to find its equal. To have seen this fine old building is to be well repaid for the journey.

There was another building outside the North-gate of the city in Chaucer's time, the Hospital of St John, and here it still stands, its magnificent oaken gateway black with age. But it is now in a busy thoroughfare, and the change from the bustle and noise of the street into the quiet secluded garden is very welcome. There is a fine old sixteenth-century kitchen to be seen here; and the little chapel is full of interest; but here,

again, the vandal has been at work, destroying parts and marring others.

Passing now into the city, we turn first to the cathedral. There are many spots about the close from which the outside of this splendid pile can be studied, notably from what is known as the Green Court. The only sounds that reach the ear are the cawing of the rooks in the elm-trees near at hand, and the strains of the organ within the building; and we can sit and sketch and dream as long as we like undisturbed. All the western part of the cathedral as it stands now, including the beautiful central tower, was built between the close of the fourteenth and the first quarter of the sixteenth centuries. All to the east of that is of even earlier date, having been built by William of Sens and William the Englishman; and this rests upon work still earlier, for the crypt was built by Lanfranc, on his becoming Archbishop of Canterbury.

Like the pilgrims of old, we enter the cathedral by the south porch, and find ourselves in the nave. From this we pass to the scene of Becket's martyrdom, and hear the story of that memorable deed, committed more than seven hundred years ago, that made Canterbury Cathedral famous for all time. Changes have taken place around this spot; but we need not hesitate to believe that it was here that the prelate turned to bay, and after a fierce struggle with his opponents, was struck down.

In the choir and north-east transept are tombs of famous archbishops, some curious wall-paintings, and the desk to which the Bible was once chained for whomsoever would to read. Close by is the vestry where the richer and more fortunate pilgrims were shown the Becket relics. Under the domed roof of the Trinity Chapel stood Becket's shrine. To this spot, from all parts of Christendom for many centuries, came kings, princes, nobles, rich burghers such as mine host of the 'Tabard' and his goodly company, to lay their oblations at the feet of the saint, to do penance for their sins, to say their paternosters, to get a glimpse of the richly-jewelled shrine, to wander as we do round the cathedral, and so home again, having seen enough to last them a lifetime. Whether they went up and down the steps leading to the chapel on their knees is extremely doubtful; considering the numbers who undertook this pilgrimage every year, the wear of the steps by their shoes is easily accounted for without putting forward any other reason.

Unfortunately for us, there is nothing to look at but a bare pavement; and it does seem a strange thing that in this age of restorations, no attempt has ever been made to restore Becket's shrine.

Next we see the tomb of Edward the Black Prince, with his surcoat, gauntlets, and shield hanging above it—a very notable monument. Then there is the splendid Warriors' Chapel, full of stately tombs; the ancient crypt, where once the bodies of Becket and the Black Prince were buried, and where the French Refugee Church is still shown. The Cloisters, the Chapter-House, the Dark Entry, the famous Norman Staircase in the precincts: the day is getting old before we can turn our backs upon the cathedral, and even then we have left much unseen.

The city is full of winding lanes and quaint

domestic architecture, at least three centuries old. In the High Street, old inns with sloping floors and lattice windows stand side by side with handsome modern shops and offices. Indeed, the very place where the pilgrims stayed is pointed out. It is no longer an inn, but a baby-linen shop. Some of them have old-fashioned names that half tell us their history. There is the 'Fleur-de-lys,' for instance, reminding us of the days when those emblems figured in the national arms. Near to this is the 'George and Dragon,' a very good specimen of the old coaching inn. Half-way down the High Street we cross the arm of the river Stour, a narrow winding stream, over which the houses seem to meet.

Just here is another of those hospitals founded for the benefit of the poor by charitable people in olden times, for which Canterbury is famous. Eastbridge Hospital—originally intended for the relief of poor pilgrims—was founded many hundreds of years ago, and the present building is of great age. Like most of these institutions, it has had a chequered history, having been spoiled of its possessions several times and re-endowed. It still harbours a few pensioners, but is chiefly a show-place, having some remarkable wall-paintings. The Black Friars and the Gray Friars also had their monasteries near here, and parts of the old buildings are still to be seen.

Like all cathedral cities, Canterbury is full of churches, most of them old, and all of them more or less interesting, according to the extent to which they have escaped the hands of the vandal and the restorer. A restored church has its monuments removed from their original position to make way for pews, its brasses stolen, its old oak pulpit taken down and chopped up for firewood, and replaced by a modern stone one. In fact, whatever was old is carefully put out of sight. In Canterbury they rarely trouble themselves to restore a church; they either let it fall into utter ruin, or else they destroy it. Whether the citizens will ever see the error of their ways, seems very doubtful; meanwhile, every year witnesses some act of vandalism.

In St Mildred's Church, at the bottom of Stour Street, near the castle, Izaak Walton was married. John Caxton, the brother of the famous printer, lies buried in St Alphege, near the cathedral; and William Somner, the antiquary, to whom the city owes a debt of gratitude that it is never likely to pay—for he first wrote its history, and took the greatest interest in its antiquities—rests in the church of St Margaret, just out of the High Street.

At the western end of that street is the one remaining gateway of the city, the Westgate. It is a fine stone archway, flanked on either side by a round tower. The walls of it are of great thickness, and it had loopholes for the archers and bowmen. It was for a long time a prison; and there is a document amongst the archives of the city that sets out that any stranger taken for a crime in the city was to be committed to the Westgate; and the heirs of certain persons, in respect of certain tenements near the gate, held by them of the lord of the manor, were to look after the prisoner by night; and the miller of Westgate Mill was to have charge of him during the day, though what he had to do with it does not seem quite clear; and the said lord of the

manor was to find the fetters and cords to bind him with.

Retracing our steps to the station, we pass the keep of Canterbury Castle. It is very similar to that at Rochester, which, to the honour of the townsmen, has been made a spot of beauty, set in the midst of pleasant gardens. The people of Canterbury have turned theirs into a coal-store for the gasworks.

Dusk is closing in as we walk through the beautifully-kept Dane John gardens; and with a sigh of regret we cast a last look at the beautiful tower of the cathedral, rising above the rest of the city, ere a bend of the railway line shuts it from our view.

THE OLD SLAVE-SHIP.

It would be a matter of some little difficulty to say, out of the many vanished types of ships, which of them all was most terrible in its appeal to the human passions. Perhaps the pirate—the genuine, old-world, Jolly Roger of the Spanish Main—might be held to be the most ghastly: the convict ship, too, was rendered a weird and lurid spectre of the ocean by the grim significance of her living freight of crime and misery; but, for pure tragic horror, there could never have gone any species of craft more fraught with melancholy and shocking associations than the slaver. To think of her is to recall stories of incredible barbarities perpetrated upon the crouching blacks, confined neck to neck down in the stifling 'tween decks; along with memories of that horribly famous tract of waters known as the Middle Passage. There are plenty of men still alive—and younger men, too, than one might imagine—who can yet recollect the slaver as among the commonest objects of the Caribbean Sea. Happily for the honour of the British flag, we have long been out of the traffic.

Yet there remains a weird kind of interest in the old slave-ship. What manner of craft was she? Tradition asserts her to have commonly been a long, low, rakish-looking schooner or polacre; with masts of a loftiness and spars of a width to give her a prodigious spread of white wings; keen as a yacht in her lines; tall bulwarks, broken at intervals by the grinning muzzles of carronades; and invariably furnished with that mysterious-looking object under a tarpaulin upon the fore-castle which one knows as well as possible will eventually turn out to be nothing more nor less than a 'long-Tom' of heavy calibre. In the main, there can be no doubt that this typical portrait is correct. If one would know the character of vessel the West Indian slaver really was, and have a picture of her and the class of gentry who composed her crew, rendered with integrity in a highly dramatic manner, it is to be found to perfection in the pages of 'Tom Cringle's Log.' No man was ever better qualified than Michael Scott to portray the slaver; and in that splendid passage of the hearty old sea-yarn which narrates the action with the Guineaman, he has given us a most graphic account of the slave-ship of his day.

Nor is the type which Tom Cringle illustrates by any means a modern creation. In a note embodied in that valuable work, Lindsay's

'History of Merchant Shipping,' is given a description of a slaver of 1786, as contained in a return upon the subject presented to Parliament, by Mr Macpherson. This ship—with a lower deck 100 feet in length and 25 feet beam—when leaving the coast of Africa, carried, besides her crew, 351 men, 121 women, 90 boys, and 41 girls—a total of 603! She lost by death on her passage 10 men, 5 women, 3 boys, and 1 girl.

In some very entertaining notes of the voyage of H.M.S. 'Thunderer' in 1843, taken by her navigating master, Mr H. Davy, is a brief account of the later Cuban slavers. After remarking that in Havana and other western ports the slave-ships are familiar enough objects, greatly admired for their beauty of form, tall spars, and general rakish, Red-Rover-like appearance: how they are also abundantly well found in every respect, and rendered as efficient and seaworthy as lavish expenditure can make them, Mr Davy goes on to describe how altered the system had become in the Mozambique, in the Brazils, and in the West Indies themselves, compared with what it formerly was. At the period of his writing, the Cuban slavers found it necessary to have recourse to every species of trickery to conceal their identity; for the blue waters of the Mexican Gulf were studded with British cruisers vigilantly alert for craft with clean-swept holds and doubtful papers. 'The vessels thus employed,' writes Mr Davy, 'bear the semblance of the fair-trading merchantmen as much as possible, being barques and ships from 300 to 450 tons burden, of American and Baltic build, and preserving the resemblance in paint and general appearance below and aloft; they are generally well found, and if such a word can be allowed, are the most comfortable ships for the slaves. The smaller vessels, wretched in every respect, look like crazy old coasters, of various forms and rigs, but mostly as brigs. Such are the guises that slavers assume in pursuit of their horrid but too lucrative traffic, from the celebrated "Venus" and "Secora," to those unseaworthy craft.'

Captain Sir Richard Grant speaks of these two infamous ships, the 'Venus' and 'Socorro' (not 'Secora,' according to Mr Davy), in the 'Nautical Magazine' for September 1839. Arriving at Havana in the 'Cornwallis' in the year 1838, Sir Richard found the port crowded with slavers, and amongst them the two crafts already mentioned. 'The slave-vessels,' says this lively writer, 'are interspersed among the shipping on the Cabana shore, and are easily distinguished by their neat and rakish appearance. At the time I write there are upwards of twenty ships, brigs, brigantines, and a fanciful variety of schooners; scarcely a day passes but that some of them ship out, always under the Spanish flag; and others, having run their cargo, hoist the Portuguese colours, and come boldly in. The two largest and finest are the ships "Venus" and "Socorro," each about 350 tons. They are much masted, in fact all legs and wings; I was surprised at their immense topsails. They are two beautiful corvettes, pierced for twenty guns, fitted in most costly style, and well found. The "Venus" is as sharp as our river steamers, and looks rather ticklish; her best voyage she made in three months fourteen days, landing close to the Havana 830 slaves. It was considered the best speculation

that had been made for a considerable time, and well rewarded the proprietors, who made the captain a present of 20,000 dollars. The "Socorro" arrived, and landed near Port Mariel 570 slaves, upwards of 200 having died on the passage. I went on board just as she anchored; she was very filthy, had thrown her guns overboard or landed them. The captain, who was a Frenchman, said they had had very bad weather. He was chuckling at having eluded the "Nimrod," which vessel came in about an hour after him.'

Lord Palmerston's Bill for the suppression of the slave-trade, introduced and passed in 1839, gave great powers to the commanders of British war-vessels to board and overhaul any suspected ships. Naval officers were empowered to detain and take charge of any vessel fitted with hatches with open gratings, instead of the closed hatches which are usual in merchant vessels; divisions or bulkheads in the hold or on deck more numerous than necessary for vessels engaged in lawful trade; spare planks fitted for being laid down as a second or slave deck; shackles, bolts, or handcuffs; a larger quantity of water, a greater number of empty casks or tanks, and a more numerous supply of mess-tubs or kids than was consistent with the requirements of the crew of a merchantman; an extraordinary quantity of provisions, particularly rice, flour, and maize, unless a manifest could be produced proving it to be part of the cargo; and, finally, carrying a larger quantity of mats or matting than could possibly be necessary for the mere use of the crew.

The result of this rigorous enactment was to make our cruisers more alert than ever in West Indian and African waters; and in the year following (1840), 76 vessels were taken and condemned, and 3192 slaves set free. Yet the infamous traffic continued to be pursued with as great activity as ever. Englishmen may well feel a justifiable flush of pride on learning, from the returns presented to the House of Commons on February 26, 1850, that between the years 1840 and 1848 British men-of-war had taken no fewer than 625 ships, whereof 578 had been condemned, and the enormous number of 38,033 slaves set at liberty. In proportion as they were hunted, however, so the slavers seemed to have grown more defiant and daring; and on one occasion whilst the steam corvette 'Pluto' was blockading the mouth of the Congo, a schooner, deep with a cargo of blacks, came gliding down the river and ran boldly past the war-vessel. The crews of these vessels so taken were found chiefly to consist of Spaniards and Portuguese, Dutch and French Creoles, and a sort of Lingua-Franca men, of no nation, or rather of every nation, belonging nowhere, claiming no country as their own, and speaking all the Atlantic languages.

In the year 1850 the British Government, believing that a good measure to arrest this detestable traffic would be by entering into treaties with the savage kings from whose territories the unhappy blacks were chiefly drawn, sent a mission to the sovereign of Dahomey. The expedition consisted of Messrs Duncan, Cruikshank, Winnett, Forbes, and Becroft. As a result of the success they met with, we give a copy of a letter of which Mr Becroft was the bearer. The epistle, written at the sable mon-

arch's dictation, ran as follows: 'The king of Dahomey presents his best compliments to the Queen of England. The presents which she has sent him [chiefly umbrellas!] are very acceptable, and are good for his face. When Governor Winnett visited the king, the king told him that he must consult his people before he could give a final answer about the slave-trade. He cannot see that he and his people can do without it. It is from the slave-trade that he derives his principal revenue. This he explained in a long palaver to Mr Cruikshank. He begs the Queen of England to put a stop to the slave-trade everywhere else, and allow him to continue it. The king begs the Queen to make a law that no ships be allowed to trade at any place nearer his dominions than Whydah, as by means of trading-vessels the people are getting rich and resisting his authority. He hopes the Queen will send him some good Tower guns and blunderbusses, and plenty of them, to enable him to make war.' What was diplomacy to do in the face of such a policy?

On the 4th of June 1832, His Majesty's ship 'Curlew,' commanded by Captain Trotter, arrived off the river Nazareth, and having very good intelligence that a schooner, known to be a slaver, lay up this stream, Captain Trotter despatched three boats, manned by forty men, armed to the teeth, in quest of her. After rowing all night, the boats got sight of the object of their pursuit lying at anchor, and the better to secure her capture, they kept close inshore, that their approach might not be perceived. By this means they got within a mile of her unobserved, when, finding it impossible any longer to conceal themselves, they made a dash for the schooner and displayed their colours. Immediately they were seen, the slaver's crew took hastily to their boats and made for the shore, except one man, who was observed to follow shortly afterwards in a canoe. The blue-jackets gave chase; but the schooner's people had so far got the start of them that they had landed and disappeared before they could be overhauled. The 'Curlew's' men then boarded the vessel, and found that she had been set on fire near the magazine, in which were stowed sixteen casks of powder. By the prompt exertions of the captors, the flames were extinguished. The lieutenant in charge then overhauled the schooner, and found her fitted up for carrying slaves. Search was made for the vessel's papers; but, as had been expected, she had none on board. One curious document was discovered, however, well worthy of reproduction as an example of the orders which were delivered to the skipper of a slaver prior to setting out upon his voyage. The manuscript, which was written in Spanish, was headed 'Instructions for Peter Gilbert, Captain and Master of the Spanish schooner "Panda," and may be summarised as follows:

(1) You are authorised, from the time of your sailing, to pursue such a course as may appear to you to be best, first consulting the first-mate, Bernardo de Soto. (2) Upon your arrival at the place of your destination, you will use all diligence in your power in the purchasing and shipment of your cargo. (3) You will take particular care that there be preserved on board, between the officers and men, the greatest subordination and

best order. (4) Neatness and cleanliness being particular objects of interest, you will take the greatest pains that they be observed on board, and that the officers contribute their care and zeal to effect this object. (5) You will observe as much as possible meeting with any sail, particularly if there be any appearance of her being a suspicious one; therefore, you will have kept a good lookout from the masthead, charging them with the greatest vigilance, particularly in dangerous places. (6) A list of landing-places, &c. (7) Immediately upon your arrival, at whatever place it may be, you are to give proper notice of the place where your cargo is, stating the number of [slaves] you have brought, &c. (8) In case of extremity, and you cannot escape the chase of an enemy, you will disembark wherever you can; for, in extreme cases, there is no other way to do than to use your best judgment to save the voyage. We have no other instructions to give you, but that, in an unforeseen event, you are authorised to follow the dictates of your best judgment and prudence, first procuring, if need be, the opinion of the other officers.'

This curious document was unsigned. The name Peter Gilbert has a suspiciously British twang about it; but it turns out that the master of the 'Panda' was a Spanish Yankee, and that his name was really Pedro Gilbert.

The old slave-ship exists no longer save in the form of an Arab dhow, a Chinese junk, or a Zanzibar dug-out. The disappearance of the West Indian slaver from off the seas dates from the conclusion of the American civil war. The moral effect of that great fight for the black man's liberty was too overwhelming for even the Spaniards of Havana to stand against; and the stealthy, rakish schooner stole away for the last time to join the shades of countless other departed types.

TO BE A CHILD.

A VILLANELLE.

I SOMETIMES fondly used to pray
(Although the wish was weak and vain)
To be a child again at play.

Thoughts of the early budding May
Thrilled through the prayer which, in my pain,
I sometimes fondly used to pray.

Sweet fragrance from the woodland way,
And song of cuckoo, made me fain
To be a child again at play.

It was a coward's prayer, you say,
That with an aching heart and brain
I sometimes fondly used to pray;

But listen—'tis the skylark's lay!—
How sweet upon the daisied plain
To be a child again at play!

For freedom from the city gray,
For meadow-path and country lane,
I sometimes fondly used to pray
To be a child again at play.

ABOUT INSURANCE.

INSURANCE is a subject in which the majority of men are interested as holders of policies on their persons or properties; but comparatively little is known of the history of this branch of commerce, or of the knotty questions in connection with it which have from time to time called for solution.

It is not easy to briefly explain the difference between insurance and assurance; but authorities lay it down that assurance relates to an event which is certain, and insurance to one that is uncertain, or may be only partly fulfilled. Thus, a contract to pay a sum of money at death or a given age would be an assurance; but one insures his house or ship, since he may suffer partial loss or none at all. But in practice the terms are treated as synonymous. The principle, again, that insurance is merely a distribution of loss, is not quite obvious when compensation comes from a company seeking a profit from its business: but it is so, the fortunate indemnifying the unfortunate. This is readily seen when members of a trade co-operate for mutual protection against, say, fire; and still more clearly when, as in the case of the canton of Zürich, compensation for loss by fire is given out of the public funds. Some corporations, especially of those connected with shipping, are their own underwriters, setting aside a certain sum as an insurance fund, and saving what they would otherwise pay in premiums. Thus, if the ordinary rate be ten per cent., the owners can afford to lose the whole of their property every ten years; and the practice has this to recommend it—more care is likely to be exercised in keeping vessels in a seaworthy condition.

Marine insurance, which is the oldest form, is of uncertain origin; but it was most probably familiar to the merchants of the republics of Genoa and Venice; while its antiquity in this country is clearly set forth in the preamble to an Act of Parliament of 1601 appointing a Commission to adjudicate on disputes arising out of

insurance. There we learn that 'it has been time out of mind and usage amongst merchants, when they make any great adventure, to give some consideration of money to other persons to have from them assurance made of their goods, merchandises, ships, and things adventured, or some part thereof.' In 1719 the Royal Exchange and London Assurance Companies were by royal charter given a monopoly of this branch of insurance, except as against individual underwriters; and this monopoly, though contrary to the common law, was allowed to exist until 1825. In connection with maritime insurance, reference to Lloyd's cannot be avoided, it being by far the most extensive organisation of the kind, insuring a very large proportion of British shipping, and possessing agents all over the world, whose duty it is to forward to London early intelligence of the arrival and sailing of vessels and of disasters. This great association of underwriters took its name from a coffee-house which in the time of Queen Anne stood at the corner of Abchurch Lane. The house was afterwards removed to the vicinity of the Royal Exchange, the underwriters going with it; but, later, they obtained rooms in the Exchange, where they are now housed.

Fire insurance comes next to marine in order of antiquity. Enforced or voluntary contributions to recompense sufferers from fire may be traced far back in history; but no attempt was made to treat the matter on business principles until after the Great Fire of London. In 1681 an office was opened for the purpose 'at the backside of the Royal Exchange;' the Hand-in-Hand was established in 1696; and several other companies soon followed. Scotland had its first fire office in 1720, Germany in 1750, and America in 1752, with Benjamin Franklin as one of the directors. The stamp duty on policies, which in 1816 amounted to three shillings for every hundred pounds insured, retarded the growth of the business; but in 1869 the tax was removed. Perhaps more caution is required in the conduct of this branch of insurance than of any other, the risks being not only of endless variety but subject

to constant change. The safety of a private house is affected by the character of the occupants, its age, the illuminants used, the water-supply, and so on; while as regards business premises no year passes without danger being discovered in some substance or circumstance to which hitherto no attention had been paid. A striking instance of the kind is that of flour-dust, which when mixed in certain proportions with atmospheric air has been found to be a powerful explosive. Arson by policy-holders, again, is a source of serious loss; and unfortunately retribution does not always follow, as, unless convincing evidence can be procured, companies are unwilling to imperil their reputation for liberal dealing by a prosecution which is likely to prove abortive. A House of Commons Committee in 1867 received evidence that during the fourteen preceding years the proportion of suspicious burnings had risen from thirty-four to fifty-two per cent. of the total number; and a recent prosecution showed the existence of a gang which had for twenty-five years made arson their business, one of them, who was known as 'the Fire King,' being alleged to have been concerned in five hundred burnings, and to have received in the shape of insurance some twenty-four thousand pounds.

In the seventeenth century it was customary for persons to insure their lives for short periods or against certain contingencies, and annuity societies began to gain a footing; but the first association to guarantee a sum of money at death was the Amicable, founded in 1706. One grave fault in the rules of this corporation—the equality of premium irrespective of age—was avoided by its successors, of which the earliest were the Royal Exchange and London Assurance, both incorporated in 1719. The Equitable, which commenced operations in 1756, broke new ground in issuing policies on joint lives and survivorships, and for fixed periods; but the data upon which all these offices worked were imperfect, no mortality tables being at the time available. For a long time the table constructed by Mr Joshua Milne, from information supplied by a Carlisle doctor in 1787, was the generally accepted one; but that and others subsequently compiled have been rendered obsolete by tables prepared in 1869 by the Council of the Institute of Actuaries in conjunction with the principal insurance companies. Life offices are carefully looked after by the State, being required to deposit twenty thousand pounds with the Court of Chancery until their security is assured by the possession of a reserve fund of forty thousand pounds. Annual accounts, and at certain periods actuarial reports, have also to be presented to the Board of Trade; and various other precautions are taken for preventing the formation of bogus companies and the continuance of companies whose solvency is doubtful.

Insurance against railway accidents dates from 1849, and against accidents generally from 1856. Many of the life offices have since taken up this business, which received an immense impetus from the Employers' Liability Act of 1880. Other branches are the guarantee of fidelity, and burglary and plate-glass insurance. The first is an obvious improvement on the old system of personal security, under which the employee was obliged to lie under a compliment to one or more

persons, of whose existence and solvency the employer had to periodically satisfy himself. The guarantee societies, too, are willing to give a collective bond for the members of a staff, arrangements being made in case of change to substitute one name for another; and all the premiums can be made payable on the same day. The offices which give security against burglary offer skilled advice as to the protection of premises, and lend men to guard unoccupied houses. Of course the rates of premium vary with the nature of the premises, and, in the case of shops, of the stock. Loss and damage may be insured against jointly or singly. The rate to cover damage only is a uniform one of two shillings per cent., except as regards jewellers' establishments; and those for loss range between two shillings and twelve and sixpence per cent.

As might be expected, a branch of business of so varied and complicated a character as insurance has occupied much of the time of the judiciary. Mr C. F. Morrell, barrister-at-law, the author of a recently published manual on *The Law of Insurance*, which is an excellent compendium of recognised authorities on the subject, and to which the writer of this article is largely indebted, cites a vast number of cases, many of them interesting. As regards misstatements in proposals, it has been decided that an error is not material unless the premium be affected, and that if a representation be substantially correct, the policy holds good. A single room in a building could not be 'truly and accurately' described as a dwelling-house, but the discrepancy has been decided to be unimportant; as also the statement that no fires were kept, though one was occasionally lit in order to air the premises. Again, there is a difference between an actual equipment of sixteen men, eleven boys, nine guns, and six swivels, and an alleged one of twelve guns and twenty men; but the error was not allowed to void the policy. But no reservation is permitted, as a man found to his cost when, a fire having broken out two doors away, he hurried off, and, without mentioning that occurrence, insured his premises. The fire broke out again two days later, spread to his place, and destroyed it; but the concealment deprived him of any claim upon the insurers. Similar decisions have been given as regards a life policy, where a person learned, after sending in his proposal, that he had a dangerous disease, but did not inform the insurance company; and where the insured failed to mention that a ship then engaged in peaceful pursuits had at one time been a celebrated Confederate cruiser.

We may wander for a moment in order to remark that soldiers, sailors, and travellers are now treated much more liberally than was formerly the case. Fifty or sixty years ago the Elbe and Garonne bounded the area beyond which the insured might not travel; but the forbidden area for ordinary premiums is now contained between thirty-five degrees north and thirty degrees south latitude, special rules, however, applying to Asia; and persons can go even within that area on payment of an extra premium; while 'whole-world policies' are issued by some offices at moderate rates. The magnitude of war premiums has seriously discouraged insurance among soldiers and sailors. A lieu-

tenant, for instance, engaged in the Egyptian war of 1882 was obliged, on a policy for five hundred pounds, to pay an extra sum of thirty pounds per annum; and two officers employed in the expedition to Ashantee paid twenty-one and twenty-five per cent. respectively. But it is not unusual for offices to remit the extra charge, in the event of the policy-holder returning in safety; and altogether the effect of competition is seen in increased liberality in this as in other directions. It is an axiom of law that nobody ought to benefit by his own crime, a provision which forbids the payment of insurance to a fire-raiser or a scuttler, and which led to an interesting trial in connection with the Maybrick case. Briefly, Mr Maybrick insured his life for two thousand pounds in favour of his wife. The insurance company resisted a claim set up by her representatives, on the ground that she had been convicted of poisoning the deceased; and the claim was abandoned. But the company also resisted that of the children, arguing that Mrs Maybrick was, under the Married Woman's Property Act, the only person entitled to the money; and the Divisional Court supported the contention. The Court of Appeal, however, decided differently, holding practically that Mrs Maybrick was as one dead, and that the money should pass to the children, as her husband's heirs.

The perils of the sea have been responsible for many legal disputes. A steamer, for example, meeting another in distress, attempted to tow her into port, and while so doing was herself wrecked. On a suit by the consignees of the cargo against the owners of the ship, it was declared that while deviation in order to save life was justifiable, it was not if property alone were in question. (It may probably be assumed that the charter-party did not expressly provide for such a contingency.) Again, a voyage having been delayed in consequence of tempestuous weather, the cargo, which was fresh meat, was ruined; but the loss was held not to come within 'perils of the sea, all other perils and misfortunes;' and the ship-owner, consequently, was liable for the loss. Nor is leakage caused by the gnawing of rats included in that category.

To the non-legal mind the term 'accident' would appear to be easily defined; but the late Lord Chief-Justice Cockburn thought not, and on several occasions insurance companies have sought a definition in the courts of law. It has been decided that a sunstroke is not an accident, but that injury to the spine through lifting a heavy weight is one. Even if physical ailments contribute to an accident, it is covered by the policy. The relatives of a man who while bathing in shallow water was seized with a fit and suffocated, sustained their claim; as did those of a man who when similarly seized fell under a train and was killed. Again, a person having fallen and dislocated his shoulder was put to bed and carefully nursed; but in less than a month he died of pneumonia. The connection between that complaint and a dislocated shoulder is not at once visible; but on the ground that the restlessness and susceptibility to cold produced by the accident led to the disease which killed him, the relatives were held to be entitled to claim.

'The influence of intoxicating liquor' has been authoritatively defined as 'influence which disturbs the balance of a man's mind or the intelligent exercise of his faculties;' and injuries received while in that condition are not covered by an accident policy. Nor are those caused by running obvious risk, as crossing a railway, even at a proper place, without exercising due care to avoid passing trains.

Less curious, perhaps, but not less important, are those cases, of which there have been several, but to which we have no space to do more than allude, where claimants were defeated by some of the numerous exceptions which companies have framed for their own protection; and if persons insuring desire to avoid disappointment for themselves or for those they leave behind, they will closely examine, and learn the exact value of, that somewhat complicated document, a policy of insurance.

POMONA.*

CHAPTER V.

To . . . Pomona, thus adorn'd,
Likest she seem'd—Pomona when she fled
Vertumnus.

MILTON.

'I WANT to show you a picture which I have been painting at intervals for twenty years,' Mr Ludlow said one day; 'and which a conversation I had with you a little time ago has inspired me to go on with; and I mean to work at it and finish it for next year's Academy. I want you and Kitty to sit to me for two figures in it. Kitty's is just the face I want for it—her round apple cheek and Ribstone pippin colouring will be exactly the right contrast to the apple blossom tints in the central figure.—And you, he said reflectively, studying her face and figure in a manner that would have been cruelly embarrassing to vanity or self-consciousness, but which Sage bore without flinching or gaining any colour in her smooth, pale cheek—a calmness to which I would draw the attention of those readers who still suspect a flirtation to lie concealed under the friendship between Owen Ludlow and Sage—'And you, I think I will dress in dead green—partly to suggest your name, Sage, and partly the apple-tree foliage, which is as dull a green as Nature has in her colour-box; though it is just right to set off the beautiful golden and red and brown of the fruit. I think you shall hold a long spray of ivy or a great sheaf of narcissus, and be all green and white and gold with the sun on your hair.'

'What is the picture called?'

'Pomona,' he answered; 'and I began painting it twenty years ago. Do you know the story?—how Spring loved her the goddess of fruit-trees? It is easy to see how such a myth arose, if you stand in an orchard in May. I fancy painters have mostly imagined her from an autumnal point of view, with fruit and rich autumn colouring; but I like better to think of her with her lover the Spring, who was always young himself, and gave to her everlasting youth, which we know is true, for we see it every year for ourselves.—But he came to her disguised as

* Copyright reserved in the United States of America.

an old woman; and I have sometimes wondered how that idea crept into the story in the warm, sunny South, though it is very suggestive of some of our bitter, cutting east-wind spring days, that woo the apple blossom in very shrewish, cantankerous, nagging fashion.—But, after all, there is nothing to compare to our English spring, in spite of its capricious, changeable ways and nasty little tempers. I have seen Vertumnus in many parts of the world; but, when he is gracious and kind in England, he has a subtle charm which is wanting in him in other countries; and I have the same feeling about English apple blossom, though I suspect this of being British prejudice, as I have seen glorious orchards in America and in Normandy.—I wonder how you will like my Vertumnus? I have tried to paint him old and dull and faded, and yet with a hint of youth and passion showing through. I don't know if I have succeeded. Sometimes I think I am attempting the impossible, and am tempted to paint him out, and let Pomona stand by herself, and Vertumnus be only represented by the spring sunshine.—Well, we will show it to Kitty without telling her the story, and see what she makes of it. Children have a wonderful, ignorant directness of criticism; they will hit the blot ninety-nine times out of a hundred; while other people go circling round, distracted by dozens of second-hand, acquired opinions, or unconsciously ashamed to say what they really think. I could give worlds sometimes to see things with a child's eyes.

Since that first evening when the boys and Kitty had so reluctantly accepted Owen Ludlow's invitation to tea, and even Sage had searched about in her mind for some excuse for declining it, no further reluctance had been manifested to accept his hospitality; indeed, Sage had sometimes to protest against uninvited invasions of the painter's studio, though Mr Ludlow assured her that the children were free to come and go as they liked.

Scar Cliff Farm stood on the high land above Scar, on nearly the highest point of the ridge that runs out into the sea, forming one end of Shingle Bay, and ending in Scar Point. It must have been a very bleak and exposed place in winter, when the great, rough west winds came roaring across the Atlantic, or the east wind whistled shrill and bitter. These swept right over the head of little Scar in its snug niche in the cliffs; but the farm must have felt their full fury, as the twisted and distorted trees testified, which grew between the farm and Scar Point, and which looked as if they were in full retreat from the edge of the cliff, vainly seeking shelter from the rude wind, which had blown their petticoats over their heads.

Owen Ludlow's studio was a large room, built on at the side of the farm, with a north light, and larger windows than the rest of the farm possessed. I think at one time it must have been a barn, and I also have dark suspicions that it was used in old times for storing away smuggled goods—those old times, which the boys so greatly regretted had passed away, when cargoes of brandy and lace and tobacco were run into snug corners among the rocks on dark nights, and the revenue cutter hovered about the coast, ready to pounce; and there were thrilling encounters of desperate

men on the cliff's paths, and pistols and cutlasses were the order of the day, and life was not the peaceful, loafing existence along the coast that it seems nowadays. I think it was the big room and the north light that kept Owen Ludlow at Scar, as well as the fascinations of Scar Point, which he had described to Sage; and it may have been partly, also, the kind face of Mrs Stock, the farmer's wife, a good, little dumpling of a woman, who treated all men-folk as poor helpless creatures, requiring endless humouring, and quite unable to take care of themselves.

She had a big solemn Methodist husband, Job Stock, who attended little Bethel at Shingle with great regularity, being elder or some sort of office-bearer there, though it could have been no office requiring many words, as he was a remarkably taciturn man, his wisdom, if he had any—and I think he had—being inarticulate. His wife set great store by his sanctity and learning, and treated him with a curious mixture of reverence and contempt, as being at the same time a shining light and a poor creature.

Kitty was not at all averse to sitting to Owen Ludlow, having already had a taste of the process when he made the sketch of her sitting on the boat, though he was half done before she was aware what he was about; and she declared her willingness to sit till Christmas if she might have Twopenny, Mrs Stock's large tabby cat, on her lap all the time.

That picture which Owen Ludlow had taken twenty years to paint, and which he displayed to Sage and Kitty that afternoon, had hardly been shown to any one before; and there was a curious nervousness in his mind as he turned the large canvas round and placed it in the proper light. It seemed like turning his very heart out to public view—it was like being suddenly called upon to shout his most private and heartfelt prayers from the house-top; and at the moment he felt that, if it cost him so much to display it to his gentle, appreciative girl-friend, and to the child, whose unbiased opinion he had wished for only a few hours before, it would be altogether unendurable to have it on the Academy wall, and to have it looked at through fashionable double eye-glasses, and criticised either ignorantly or scientifically. 'No. 389.—What is that? Pomona. Let me see, who was she? Some one in the Bible, wasn't it? Or was it in one of Shakespeare's plays?—Who did it? Ludlow? Ludlow? Don't know the name. We really ought to have marked our catalogue before we came, so as not to waste our time on unknown painters.'

Or worse still, perhaps. 'How's that for flesh tints? Out of drawing in that arm, eh? Where did he raise his model? Oh, any one can see that with half an eye; it's Pattie Seymour, Jones's Madonna, and Smith's Phryne.'

Great heavens! what desecration!

'She must have been very lovely,' Sage said, knowing—though he had never told her—that it was Katharine, the young wife, dead long ago, who smiled out of the canvas. She was dressed in a loose classical dress of creamy white, showing here and there an under garment of soft pink; and she was stretching one dainty hand to pick a narcissus growing at her feet; while the other hand rested lightly on the lichen-covered branch of the apple-tree under which she stood, and

which was covered with apple blossom of the same tint as her complexion, through which showed the sky of the very same blue as her eyes.

If all the world were like Sage, Owen Ludlow felt he would not have minded all the world seeing his treasure.

But Kitty? She was standing tilting slowly backwards and forwards from heel to toe, a habit of hers when she was deeply ruminating; and her brows were knitted over her eyes, which were fixed, not on the central figure, which was the only thing that Sage looked at, but on the other figure, in the shadow, half-turned away—another woman, with a worn, handsome, dark face, and a certain dignity in her tall spare figure, looking down at the sweet, radiant face of the girl with glowing, dark eyes.

'I don't understand what it means,' Kitty said with that perplexed frown; 'and I don't like that old woman. She puts me in mind of the wolf in Little Red Riding-hood—"What big eyes you have, grandmother!"—"The better to see you with, my dear."—She's horrid. She looks as if she were going to eat the girl.'

'Oh, hush, hush! Kitty,' Sage interrupted with a quick glance at Owen Ludlow's face, to see if he were offended at such openly adverse criticism; but he only laughed.

'I think, on the whole, that is a feather in my cap,' he said. 'I've looked at it till I could see no meaning in it, and Vertumnus was just an ordinary old woman without a sign of anything out of the common about her. If it tells its tale to every one as well as it does to Kitty, I shall be well content.'

CHAPTER VI.

I was a sketcher then;
See here, my doing: curves of mountain, bridge,
Boat, island, ruins of a castle, built
When men knew how to build upon a rock.
TENNYSON.

To both Sage and Kitty those sittings to Owen Ludlow were very pleasant. Kitty did not find the solace of Mrs Stock's cat invariably necessary, though it was freely accorded to her whenever she wished.

It was no very important part of the picture that the two girls filled. I daresay many who looked at it when it was finished hardly noticed the slim, fair girl on the right side in the dull green, clinging dress, holding a trail of ivy loosely in her hand; or the child sitting at her feet in a russet brown dress, and with her round red cheek and warm colouring of hair and complexion showing up richly against the dull hue of her companion's dress.

The attention was concentrated, as was right, and intended, on the central figures; but Kitty, at any rate, regarded the picture as a portrait of herself and Sage, with the figures of Pomona and Vertumnus forming an insignificant background.

Sage, too, lived a good deal in the picture, though with her the central figures played a larger part. Pomona was her friend, Vertumnus had made her his confidante. By-and-by, when the disguise fell away, and the young god stood confessed, Pomona would turn to her in her surprise, and clinging to her with those fair, soft arms, hide her shy, sweet face on her shoulder.

I wonder—but this never occurred to Sage's mind—if, when that supreme moment came, Vertumnus or Pomona either would have cared for the presence of a third, however sympathetic.

'Sage,' Owen protested, 'you have introduced a new element into the picture. I never intended or imagined that any one should have seen through Vertumnus' disguise; but I have done my utmost to take the recognition of him out of your eyes, and it is always there. Well, let it be—lookers-on, they say, see most of the game; so perhaps the little maiden standing by saw more than Pomona herself. I painted Vertumnus from a young fellow who was with me for a long time in California. He was hardly more than a boy then: let me see, that must be something like ten years ago. He had got into some sort of a scrape at home, and fallen out with his people. He was a good-looking, clever lad, and had been spoilt and made much of; and from all he told me, I'm sure his father was only too anxious to receive the prodigal back, and kill the fatted calf; but he couldn't make up his foolish, young mind to eat humble-pie, which is often the form in which the fatted calf is served up, and to be forgiven and rejoiced over; so he went right off to America; and there, I fancy, he did a good deal of the pig-minding and husk-eating part of the business before I came across him. He was pretty well at the end of even those resources when he stumbled into our ranch one night, and just dropped at the door as we sat smoking the pipe of peace after our day's work. Collins thought he was drunk, and I thought he was dead; but he was neither one nor the other; though he did his best to justify my opinion any time the next six weeks, when he lay on my bed, and Collins and I nursed and doctored him on principles evolved out of our inner consciousness. I wonder we did not kill him twenty times over between us; but he had the constitution of a horse, and survived our treatment, and was benighted enough to believe that we saved his life, and was so outrageously grateful, that Collins declared that life was insupportable under the weight of virtue imputed to him. But we both of us liked the young fellow; and we got so used to having him pottering about us, that when he went home to his people, we found the old diggings, that had done well enough before, so quiet and dull, that with one consent we agreed to strike our tents and return to civilisation.'

'Have you seen him since?'

'Oh yes; he often swoops down on me when he's in England. He is a Secretary or something at the Embassy at Edelstadt—plenty of fun and not much money. I think it's rather a throwaway, and that he had stuff in him to do something better; but his people are the smart, fashionable sort, and I think they expect him to marry money, and get on that way.'

'Not marry Pomona?'

'No; her apples were not golden. You can't tell from the picture how good-looking he is, for I have taken the youth and the sex out of his face. I wish I had the sketch I made of him for the picture to show you; but I sent it to his mother. It was while I was painting it that I found out who he was, for he kept his name dark, and always protested that he wouldn't go home till he had made his fortune—or, at any rate,

a competency. But fortunes are not made in a few days, or competencies either; and I had my doubts if he was the sort to make either; and it did not look like doing it in a hurry, just pottering round and washing my brushes, and filling old Collins's pipe; and I knew he had a mother, for he talked of her no end, when he was light-headed with the fever. So, when he dropped out by accident the name of the place where his father lived in Yorkshire, I pretended to take no notice; but I wrote to a man I knew not far from there, and asked him to find out who they were, and to drop them a hint of their son's whereabouts; and a few weeks later, old Collins came in with a letter directed to Maurice Moore, which we both agreed was a name we had never heard, and that it must be some one at Nelson's ranch, ten miles on. But just then I happened to look up, and saw my young friend's face crimson, and his mouth twitching, though, if his name was Robert Baines, as he had made out, there seemed no reason why he should have taken any notice. But I guessed in a minute what it meant; and I just tossed the letter down on the table, and got Collins out of the way for a bit; and when we came back, both the letter and Baines were gone; and indeed Baines never came back, for in the evening Maurice Moore came in and told Collins and me that he had heard from home, and that his mother was ill, and he supposed there was no help for it but that he must go back. He could not imagine how they had traced him out, and I don't think to this day he knows. It's all very well to say what's in a name? But there is a good deal; and I have never quite felt that Maurice Moore and Robert Baines are the same; and I have a sort of fancy that some day the old Bob will come sauntering in, in his flannels and broad felt hat; and we shall all laugh to think we ever could have mistaken Maurice Moore for him.'

It is very curious how often it happens in life that you think or hear of a person immediately before you see him; that some one comes into your mind of whom, perhaps, you have not thought for weeks or months, and the minute after, you meet him in the street, or find a letter from him on the breakfast table. So it happened in this instance that the very day when Owen Ludlow had been telling Sage the story of Maurice Moore, he appeared on the scene, coming, as it seemed to Sage, right out of the sunset, and arriving on the extreme end of Scar Point, while the painter and the two girls sat on the beach watching the glowing sky.

'Look!' Sage exclaimed; and Owen Ludlow, who had perceived him at the same moment, echoed the word. It was too far off to distinguish who it was; but even at that distance Sage was certain that Kitty's guesses as to his identity were not correct, and that it was neither Cottam nor Leach, nor any other of the Scar men. They watched him as he came along the top of the ridge, distinct against the sky, and then lost sight of him as he turned down the cliff-path towards Scar; and they had forgotten all about him, and were slowly wending their way from the beach to the village, when some one came with a flying leap from the bank above, right in front of the painter, and seized him by the shoulders and whirled him round.

'Bless my heart! Sakes alive! Goody gracious! Well, a never!' Ludlow exclaimed in the accents of a frightened old woman.—'Sage, this wild man of the woods, this octopus, this Jack-in-the-box, this bolt from the blue is Maurice Moore!' 'But Sage had needed no introduction, for she knew it was Vertumnus.'

MILK-TREES.

PLANTS yielding a milky juice are not at all uncommon; they can be found in numerous families of the vegetable kingdom and in all parts of the world. Thus, in our own country we have the Dandelion, Poppy, and certain members of the order Campanulaceæ (Harebell family), and also species of Urticaceæ (Nettleworts). It is to the acrid juice secreted by the gland at the base of the sting of the common stinging nettle, that we owe the unpleasant effects produced by contact with this plant.

Although many of these plants yield a milk which is highly acrid, and in some cases very poisonous, there are a number whose latex possesses useful properties. Thus, we have the 'Carica Papaya,' the juice of which has already been alluded to in an article upon Vegetable Pepsine which appeared in the *Journal* of October 1, 1892. India-rubber and gutta-percha are each the solidified milk of various species of plants; and last, but not least, we have five trees in the New World which are stated to produce milk as abundantly as cows, and quite as palatable. One of the best known of these, 'Brosimum galactodendron,' is a tree of the Bread-fruit family. It grows from fifty to one hundred feet in height, and is found in large natural forests on the mountains near Cariaco and elsewhere along the sea-coast of Venezuela. The milk, which is obtained by making incisions in the trunk of the tree, has a slightly balsamic odour, and a taste resembling that of sweet cream. It is very nourishing, and perfectly wholesome, the only unpleasant feature about it is that it is rather glutinous.

Humboldt, writing upon the plant, says: 'We drank considerable quantities of it in the evening before we went to bed, and very early in the morning, without feeling the least injurious effect. The negroes and the free people who work in the plantations drink it, dipping into it their bread of maize or cassava. The majordomo of the farm told us that the negroes grow sensibly fatter during the season that the Palo de Vaca—one of the Spanish names for the tree—furnishes them with most milk. This juice exposed to the air presents at its surface—perhaps in consequence of the absorption of the atmospheric oxygen—membranes of a strongly animalised substance, yellowish, stringy, and resembling a cheesy substance. For several months of the year not a single shower moistens its foliage; its branches appear dead and dried; but when the trunk is pierced, there flows from it a sweet and nourishing milk. It is at the rising of the sun that this vegetable fountain is most abundant; the blacks and natives are then seen hastening from all quarters, furnished with large bowls to receive the milk, which thickens and grows yellow on its surface. Some

empty their bowls under the tree itself; others carry the juice home to their children.'

Humboldt advised Boussingault to submit it to a chemical analysis, which he did. He says the milk produced from the tree is of a thicker consistence than that of the cow, and its reaction is slightly acid; exposed to air, it turns sour, and coagulates into a sort of cheese.

Summing up the results of his analyses, he says: 'We have found in this milk (1) A fatty substance like beeswax, melting at one hundred and twenty-two degrees Fahrenheit, very soluble in ether, but less soluble in boiling alcohol. It probably consists of several substances; and after being melted and cooled down, has the appearance of virgin wax. We made good candles with it. (2) A nitrogenised substance analogous to caseine, and recalling the vegetable fibrine which Vauquelin discovered in the sap of the "Carica Papaya." (3) A saccharine substance, the exact nature of which we were unable to determine. (4) Salts of potash, lime, and magnesia partly in the state of phosphates. For some time M. Boussingault was unable, owing to other pressing matters, to ascertain the nature of the sweet matters; but he ultimately determined them as made up of sugar, inverted sugar and gum, easily turned to sugar.' In concluding his report, he says: 'The vegetable milk by its constitution approaches as nearly as possible to the milk of the cow, for it contains a fatty substance, saccharine matters, albumen, and phosphates. But the proportion of these substances is different in the vegetable milk. The amount of fixed matter is three times larger than that in the milk of the cow; so that the vegetable milk approaches more nearly to cream than to milk.'

Dr Spruce, the renowned South American traveller, mentions another tree, a member of the Dog-bane family, the juice of which is used as milk. On the bark being wounded, the milk flows abundantly, and is of the consistency of cow's milk, of the purest white, and sweet to the taste. The Indian mode of taking it is to apply the mouth directly to the wound, and thus receive the milk as it flows. Dr Spruce says he has often partaken of it without experiencing any ill effects.

In Guiana, the natives employ the milk from a tree belonging to the same family as the last named; in the vernacular it is known as Hyahya, and to botanists as 'Tabernaemontana utilis' (so named after Jacobus Theodorus Tabernaemontanus, a German physician and botanist). The milk has the same flavour as sweet cow's milk, but is rather sticky, on account of its containing some caoutchouc.

In Para, a lofty tree, belonging to the Star Apple family, attaining a height of one hundred feet, is used in a similar manner to the others mentioned. Incisions are made in the bark, and the milky juice flows out copiously, about the consistence of thick cream, and if it were not for its taste, which is somewhat peculiar, could hardly be distinguished from it.

Besides the general usefulness of the juice as milk, it possesses a property which, although far more valuable, is oftentimes overlooked. Our readers will have noticed the fact that the milk is always viscid, and contains a little caoutchouc: this renders it a most important remedy for

dysentery. Its utility in this respect has been personally confirmed by an English gentleman who, some years back, resided on the Pacific coast. He says: 'I was attacked with diarrhoea, which in two days passed into very severe dysentery. In the space of twelve hours I was reduced to a state of utter prostration, suffering the most excruciating pains. The bloody discharge was so terrible that it seemed possible to predict death within a few hours. The violent phase of the disease only developed at nightfall, and I passed the night in a helpless state. At daybreak the wife of one of our inspectors was called in as a nurse, and by nine o'clock *leche de vaca* (Spanish for the milk) was obtained. Up to this time I had been getting rapidly worse, and was then hardly conscious. The milk was given to me—a tablespoonful in a glass of water—every half-hour till twelve o'clock mid-day, and at this hour I was perfectly free from dysentery or the slightest symptom of it. Broths and light foods were then given to me for a few days, and I was restored to perfect health without taking any more milk or other medicine, and without having the least recurrence of symptoms of dysentery.'

The tree from which this milk was obtained was the 'Clusia galactodendron,' a native of Venezuela, but found also on the Pacific coast, and in one or two other places. It is said to contain a resinous and an astringent principle, and an aromatic and tonic substance. The action of this combination is considered to be mechanical, so far as relates to the resin, which no doubt coats the intestines with a film and allays irritation. No other medicine is used in Choco, or on the Pacific coast of New Granada, for dysentery, and this disease is thought little or nothing of, as it is so easily cured.

THE BURDEN OF ISABEL.*

CHAPTER XXXVII.—SUFFIELD GOES INTO THE 'CORNER.'

ISABEL'S opportunity had come: the crisis had arrived—which she had so vividly anticipated some weeks before—when her 'family,' who had rescued and nurtured her youth, needed the surrender of her wealth, if not of herself. Without hesitation she sat down and wrote a cheque for fifty thousand pounds, payable 'to George Suffield, Esq.' ('my dear uncle,' she had a mind to add, so that all the world might guess from this document how good he was). She knew enough of her own business to be aware that there was not nearly so much money as that lying to her credit at the bank; but she also knew that certain securities could be quickly realised on the morrow. She did not wish to encounter George again; so she waited until after dinner, and then she set out with her cheque for Rutland Gate. She followed the footman into the library, where, he said, Mr Suffield sat alone. She knocked, and a smothered voice said, 'Come in.' She entered. Her uncle was sitting up in his easy-chair with a red bandana over his head, and an open book near him on the table.

'Trying to have an after-dinner nap?' said

* Copyright reserved in the United States of America.

Isabel. 'I am so sorry to have interrupted you, uncle! But I wanted to see you alone.'

'No apologies, my dear,' said he—'no apologies. I was just looking at that *Don Quixote* there—wonderful book that!—and those pictures of Doré's—wonderful imagination Doré had, and all that sort of thing; and I was reading where that rascal, Sancho Panza, says, "Blessed be the man that invented sleep!" (nobody invented it, of course, you know)—"it wraps you about like a cloak!" And thinks I to myself, "By Jingo, now if I don't try it!"'

'You dear old uncle!' said she. 'And I interrupted your experiment!'

'It's of no consequence, my dear,' said he, with a laugh at his own joke; 'for I believe I've tried th' experiment before.—Sit down, and tell me th' news. I can't give you long, because I must be off presently to catch th' night-train down to Lancashire.'

'I believe, uncle,' said she, 'I've come on the same business as you must be going on.'

'Sayst tha, lass?' said he, and a shade of unusual seriousness settled on his face.

'George has told me all about it,' said Isabel, now somewhat shy about broaching her business; 'and I want you to do me a great favour, uncle.'

'What I can do, I will, my lass,' answered her uncle, eyeing her.

'I want you to let me help you with the money Uncle Harry left me. I have brought a cheque with me; there is not so much as that at present in the bank, but I shall make it all right to-morrow. Take it, please, uncle.'

He took the cheque from her hand, and looked at it and looked at her.

'It's not the whole,' said she, with a blush. 'But some of the securities will take a little time to realise—won't they?'

'It's the biggest cheque I ever saw!' exclaimed her uncle, looking at it again.

'And you will take it and use it, uncle, as a—' as a present from me?'

She was doubtful of his look: it did not seem to her that of an acceptor of a present.

'I'll take it, my lass'—

'Oh, thank you, uncle!' she exclaimed.

'I'll take it, my lass, but I'll not use it. But I'll frame it with a gold frame, and I'll hang it up and keep it as the biggest and the kindest cheque I ever saw!'

'Don't, uncle,' said she, with a deep blush of confusion and disappointment—'don't treat me as a child—as if I don't understand what I am doing!'

'Thou'rt nobbut a child to me, Bell, my dear,' said her uncle, rising with tears in his eyes, and patting her cheek, as he had been wont when she was a little girl. 'Thou'lt always be to me the bit of a lonely lass that gave me her hand in this London twenty years ago, and came away wi' me to Lancashire, and that has been a daughter to me ever since.—I understand, my lass, why thou'st done this! I thank tha, my dear!' He took her hand and pressed it. 'But it conna be! Can a father take his lass's bit of brass because she's generous enough to hand it over to him, and because he has been an owd fool?'

At that, Isabel was touched enough to shed tears, and foolish enough to have not a word to say.

The footman entered and addressed Mr Suffield. 'The keb's at the door, sir,' said he, and withdrew.

'Well, Bell, my dear,' said Suffield, 'I must go. But first—in case of mishap.'—He sat down and took pen and ink and wrote across the back of Isabel's cheque, 'Cancelled by Geo. Suffield,' folded it and put it in his pocket-book. 'Now, lass,' said he, rising again, 'kiss thy uncle, and say "Good-bye."'

Isabel kissed her uncle affectionately, saying: 'But I haven't done with you yet. It remains to be seen whether you are to have your way, uncle, or I mine.'

Her aunt entered to see that Suffield was properly wrapped up for his journey, and to beg that she might hear every day how matters went. Isabel and she stood on the steps to see the excellent man enter the cab and drive away through the winter night, to remedy or control the evils wrought by the self-confidence and rash ambition of his son.

Suffield went down to Lancashire strong in the main resolves to clear the name of his house from the offence and iniquity of 'cornering,' and to purge his business of such irregularities as had crept into it during his son's reign. It was not yet quite evident to himself into what details of action these resolves would lead him; for though, in the first flush of his indignation, he had been ready to make an immediate sweep of the 'corner'—so far as George was concerned in it—he now saw, being calm and having considered, that while ruin might be brought on himself by haste, no harm need be wrought on others by delay and temporising. He would like to 'unload' himself of the Gorgonian responsibilities—for his son's responsibilities were his—without gain to himself and without loss to others; he feared it was impossible to 'unload' at all without some loss to himself; but he hoped that by management the loss might be kept small.

When he showed himself at the works in the early morning, all were delighted to see him, but all wondered what had 'come to Mester George,' that 'th' owd mester' was there alone. Late in the day the effect was similar in the City—in his own office, in the streets, and on 'Change.

'Hallo, George!' was the greeting of old acquaintances. 'What's brought tha here again?'

'Business, my lad—business,' was his answer. 'Matters o' business to be seen to. But tha knows th' saying: "A wise head keeps a close tongue."'

Next morning he received a telegram from George, from Marseilles: 'Both train and steamer no go. Going on by steam-yacht. See Gorgonio.'

'Hired the yacht, I expect,' said Suffield to himself. 'That's more expense to little purpose!—And now, I suppose, in any case I'd better see that Gorgonio creature about this cornering.'

But the day was Saturday, when business closed early. Suffield, therefore, resolved to leave Gorgonio alone till Monday morning. He sat down and wrote to him that he wished to see him on very important business, if he would be so good as be at liberty to listen to him at an early hour on Monday. But his wish was grati-

fied sooner than he anticipated. He was just thinking of locking his writing-table and going home to Holdsworth, when Mr Gorgonio was announced.

'Show him in,' said Suffield, and twisted round in his chair to receive him on the defensive.

Gorgonio entered with smiles and bows, and a general profuseness of affability and politeness. He had, he said, expected to meet Mr Suffiel the younger: he presumed he was addressing the father of Mr Suffiel the younger?

'Yea,' said Suffield; 'I'm responsible for him both as his father and as head of the firm.' And he gave Gorgonio a pointed look to emphasise his statement.

'I am please, Mr Suffiel,' said Gorgonio politely, 'to make your agreeable acquaintance.'

'I'm sorry to say, sir,' replied Suffield, 'that I can't return the compliment.'

Gorgonio looked a little put out by that reply; and perceiving that Mr Suffield was not only not prepossessed in his favour but absolutely prejudiced against him, his amiability sank into a more insinuating and watchful quality.

'I come over,' said he, 'to fill an engagement to lunch with your son, but I suppose he have forgot.'

'I suppose he did,' said Suffield; 'and you see he's not here to-day. Still, if you like to lunch with me'—

'Thank you, Mr Suffiel'; but I cannot impose upon your politeness.'

'Just as you please, sir.—But what,' continued Suffield, 'is this precious cotton business you and my son are concerned in?'

'You must excuse me, Mr Suffiel,' said Gorgonio; 'but I cannot speak of your son's private business.'

'Private business be hanged, sir!' said Suffield. 'It's not so peculiar and private to my son but that, so far as I understand yet, my money's pledged in it! What is the game?'

'You must excuse me, Mr Suffiel,' persisted Gorgonio. 'But at least I cannot tell you without your son's authority.'

'Very well. If you refuse to enlighten me fully about this business, I must refuse to be accountable at all for my son's engagements.'

'We had better wait, Mr Suffiel,' said Gorgonio, 'till your son can be present.'

'My son, sir, cannot be present for two or three weeks'—

'Two or three weeks?—weeks?'

'He has gone away on a voyage—for the good of his own health, and mine, sir, and I cannot say when you will have an opportunity of seeing him.'

'It is very bad weather for voyage,' remarked Gorgonio, now gray-skinned and sharp-eyed with alarm and suspicion.

'My son's an Englishman, sir,' said Suffield; 'and he prefers a voyage in bad weather, with the sea as rough as the wind can make it. But that's neither here nor there.—Are you going to explain to me the position of things, or are you not?'

'I am to speak to you, Mr Suffiel,' said Gorgonio, 'as if you were your son—is that so?'

'That is so.—Now, fire away.'

'Well, Mr Suffiel, the second part of that con-

signment from Bombay what you did give Mr Tanderjee a three-fourths advance for, is come into dock; I have seen it this morning, and it is not—any more than the other—worth two-pence a pound!'

'I'll see that cotton on Monday morning myself,' said Suffield, taking out his tablets and making a note. 'Go on.'

Gorgonio stared in some surprise: obviously this was not the same man as Mr Suffiel the younger.

'I have bought for us,' continued Gorgonio, 'in the last two days ten thousand more bales for January delivery.'

'At what price?'

'At six and five-eighths.'

'And what is the "spot" price?'

'Spot, Mr Suffield, is six and eleven-sixteenths; so, you see, we do very well.'

'Now,' said Suffiel, 'we come to the business I wanted to talk to you about: I had written to you to make an engagement for that purpose. You'll oblige me, sir, by buying no more; about the getting rid of what we have I can't speak till I know the whole situation.'

'Getting rid, Mr Suffiel! Unloading, Mr Suffiel! Oh, my great heaven!—do you know what you're saying, Mr Suffiel? The business is going just beautiful! Prices is steady! Nobody is afraid! Nobody believes nothing is going to happen! We hold two hundred thousand bales at this moment against a stock of a little over seventy thousand!—and nobody guesses it!—Get rid, Mr Suffiel? Bust up the loveliest corner as ever was?—and lose your chance of more than one hundred thousand pounds profit? Oh, surely no, Mr Suffiel! you are joking.'

'I've never knowingly made, money dishonestly,' said Suffield with unusual sternness, 'and I and mine are not going to begin now! If I made the profit you name out of this cornering business, I'd do it only by ruining or crippling scores of men! I won't do it! And if I could, I'd shake the whole business off my hands this minute! But my son engaged to back you with money in this, and I'm responsible for my son. He gave you his word'—

'He give me his bond!' exclaimed Gorgonio. 'I have it on paper! It is in black and white!'

'His word would ha' been binding enough,' said Suffield quietly. 'He gave you his word, and I must be bound by it. But since I—that is, my son—engaged to find the necessary money, I must have a voice in the business—and a final voice. And I say I want to have done wi' it as soon as possible: you'll do no cornering wi' my help. Clear it out—and the sooner the better. Only, at the same time, as I don't want to see anybody else lose, I don't want to lose myself if I can help it.'

'You are bound to lose, Mr Suffiel!' said Gorgonio desperately. 'Bound! When the "bears" find you selling—and you can't sell two hundred thousand bales in a hurry without being found out—down they'll send the prices!'

'Well,' said Suffield with a grim tightening of his month, 'all I can say is: let us lose as little as possible.—You seem to have known how to

* 'Spot' price means, the price for delivery at once, or on the 'spot.'

buy without raising suspicions; you should be able to sell.'

'And what, Mr Suffiel, is to become of my profit?'

'You'll have your broker's commission from me: won't that do?' said Suffield.

'That is very little!—for all the time, all the brain, all the skill and knowledge I have spent on this business! Ah, this beautiful corner!—to be spoil!'

'I'll do this much more,' said Suffield: 'if you can get off these bales at contract prices—at the prices you took them up at—you shall have double commission; and that, sir, is, in my opinion, more than twice as much as you deserve. A man that plans and makes a corner should be sent to hard labour and fed on skilly, just as much as a man that steals his neighbour's purse.—Good-morning, sir. I'll call on you on Monday, when, maybe, you'll see your way a bit better.'

IN IRON-LAND.

THERE are few dwellers in towns who are unacquainted with the inconvenience which arises when 'the streets are up.' Vehicular traffic has to be diverted into side-streets, and pedestrians as they pass along the pavement look down over temporary barriers into deep channels which are being hollowed out below the roadway. It may be that the business man as he passes the same spot morning after morning on his way to his office takes a little interest in watching the progress of the proceedings from the first stroke of the pickaxe on the hard road, until he sees the huge water-pipes, or perhaps the smaller gas-pipes, lowered into the cavity constructed for them. And perhaps the thought strikes him, whence come all these black pipes, which form the arteries for gas or water, branching out in all directions beneath the surface in our towns?

Well, a very great number of these pipes come from Staveley, in Derbyshire, where iron-works have been in existence for more than two hundred years; and the name 'Staveley Iron-works' is not an unknown one on coal-trucks, for the existing company are not only iron manufacturers, but extensive colliery owners as well.

It is in the second half of the seventeenth century that we first come across mention of 'a furnace' at Staveley. There was iron ore in the neighbourhood, which was dug and smelted on the spot, the material employed in the furnace being the wood which grew on the hill-sides around. Local ore is no longer employed, and most of that now used comes from Northamptonshire. The land on which these first works were situated was leased from the family of Frechville, who had already been at Staveley Hall for about three hundred years. The undertaking was a very small one, and the smelted iron could, so bad was the state of the roads, only be carted away in the summer. Some hundred years later we find a 'forge' mentioned, which shows us that the iron had now begun to be worked up at Staveley into manufactured articles. The business continued in private hands, growing gradually, until it became that of a company in 1864. The rapid progress which it has made in the last half-century may be estimated from the fact that

in the year 1840 there were only one hundred and twenty men employed in the works, while now there are eleven hundred. Those who like statistics will also be interested to hear that fifty thousand tons of castings and thirty thousand tons of pig-iron are turned out annually from the works. Of these castings, the larger number consists of water and gas pipes, though other articles are made; and at one time cannon-balls were manufactured at Staveley.

Leaving for the present the site of the ancient 'forge,' let us enter the principal works which lie between the railway line and the river Rother. A row of huge blast furnaces is the most conspicuous feature before us as we walk down from the station; and these, again, are flanked by the tall chimneys of the engine-houses. We make our way to the offices, and are soon provided with a guide. The first thing which strikes us as we walk across the yard is that we are surrounded on nearly every side by stacks of black pipes of all sizes; and here, just in front of the offices, we come across an archaeological curiosity. Side by side with a line of new iron pipes is a collection of trunks of trees hollowed out down the centre. These tree-trunks were the water-pipes of our ancestors, and the ones we are looking at actually formed a part of the original system constructed by Sir Hugh Myddleton, about the year 1666, for the purpose of supplying London with water, and were discovered beneath the Euston Road a short time ago. They seem to have done their work well, though their bore is not a large one. The largest modern pipes which are pointed out to us in the Staveley works are forty inches in diameter. Should the scheme of emptying one of the Welsh lakes into London ever become a reality, pipes of pretty considerable magnitude will be necessary to pour the water into the metropolis.

We are first taken into the pipe-factory, where we see deep circular holes sunk in the sand, which form the moulds in which the pipes are cast. The central core has, in order to give it sufficient adhesive character, to be formed of a very evil-smelling compound. The pipes when cast are finished off neatly at the end, and turned smooth on the outside and at the collar, where they fit into one another. They are then taken to another part of the works, where they are tested as to their soundness. This is done by closing up the ends of the pipe and then forcing water into it by means of hydraulic pressure. When the pipe is as full of water as it can possibly be, a workman strikes it smartly with a hammer, and under this treatment any flaw is sure to discover itself and burst. Sometimes oil is used instead of water in the testing process. The pipes are finally dipped in a huge caldron of boiling pitch, and when dry, are ready for use. It may be added, however, that different companies have different ideas with regard to the size, length, and finish of gas and water pipes, so that the Staveley works have to be ready for different classes of customers.

Blast furnaces are too well known to need any full description. Suffice it to say that coal and iron ore are packed into enormous cylindrical furnaces of some fifty feet in height; that the melted iron is run out from the furnaces into channels, or furrows, marked on beds of sand, and

that in the form which it thus assumes of short rough bars, it is called 'pig-iron.' The blasts of hot air which are forced into the furnaces—hence their name—are driven by a fine old-fashioned beam-engine of great size. It is curious to notice in the engine-room how mechanical checks are used to test the work that is done. There is pointed out to us against the wall a dial which records the number of revolutions of the fly-wheel during any specified time, and by means of this tell-tale index the manager can inform himself as to whether the engine-man has kept his machine at full working power.

But there is a great deal of machinery at the Staveley works besides that required in connection with blast furnaces and pipe-casting, for here the company constructs all the engines and other machinery needful for their numerous collieries, which are situated on the spot or in the neighbourhood. We are therefore invited to inspect the fitting-shops with their lathes, punching and cutting machines, steam-hammers, and all other appliances necessary for the construction of a steam-engine.

From the noise and heat and dirt of the work-shops of this character, it is pleasant to turn into the clean and quiet pattern-making shops. In these we see a band of workmen engaged in complicated carpentry, somewhat resembling the manufacture of furniture. But they are not engaged in cabinet-making, but are constructing, according to drawings prepared by the engineers, the wooden patterns or models which are to give their shape to the moulds in the sandbeds in which the iron castings are to be formed.

And now we cross the little Rother, which runs through the middle of the works, and divides the older part from the more modern portion. The little river runs merrily along over its stony bed, and a few trees stand yet upon its banks. Doubtless it was formerly a clear trout-stream, though its waters are of course now much befouled. On the banks of the river the original 'forge' once stood, and the Rother performed, by means of a large water-wheel, the work of moving the simple machinery employed in former years. Close to the site of the old mill is a house where the manager lived. It was once a pleasant habitation, with a garden, by the side of the stream; but soon the overhanging and rapidly increasing bank of 'tip,' or refuse from the works, will swallow it up. A little farther on is a mullioned-windowed house, perhaps nearly three hundred years old, still standing amidst grimy surroundings. This was once the farmhouse of the estate.

And now we have passed right across the works and from one bank of the Rother to the other, and we find that we have reached another line of railway, for the works are hemmed in by the iron road on each side. Upon a hill above this railway we see the modern workmen's village, crowning a slight elevation known as Barrow Hill. Close to the line stands a well-built and well-appointed Mechanics' Institute; and farther up the hill is a school chapel, which is served by the clergy of the mother-church of Staveley, in the old village, about a mile and a half away. In the school we see hanging on the wall the portrait

of Mr R. Barrow, the last private owner of the works; and one is glad to note that the company have not failed to carry on and develop the various organisations for the good of the workmen which he or his predecessors in the business originated. It is in contemplation that a permanent church should be built here, and then the existing building will no longer be used as it is now, and with much inconvenience, for a double purpose.

It is satisfactory to find, as we do now nearly everywhere, that the workpeople of large manufacturers are not treated as mere machines, but that provision is made for the moral and spiritual good of themselves and of their families by their employers. It is in such ways that a right aspect is put on one side of British industry and commerce, which was perhaps once neglected; and under such auspices it is to be expected that commercial enterprise will flourish in this island even more than it has done before.

A MALAGASY GHOST-STORY.

ONE evening I was sitting beneath the veranda of a house on the borders of the Upper Forest in Madagascar. It was one of those glorious evenings only to be found in the tropics, when the afterglow of sunset enriches and enhances the beauty of everything before darkness hides them for another night; when red flowers look like flame, and yellow like burnished gold. As the sun sank deeper below the horizon, the colours slowly changed, one blending with another till all grew sombre. Over to the east, behind the Forest, shot up the great white beams of the rising moon, distinct and regular. The trees stood out in bold relief; the very leaves seemed to separate and let the moonbeams through.

Grand as was the scene, my thoughts, I must confess, were hardly in keeping with it. I was thinking of pigs. I had been told by some natives that some wild pigs had been devastating their crops, and I was wondering how I could get a shot at them that night.

As I sat pulling at my cigar, and wondering if it were possible to secure the services of an old native who was said to be exceptionally skilled in the matter of pigs, I saw a shadowy form coming towards me; and presently the dusky figure of a native stepped out of the shadow into the moonlight, his white *lamba* (a long cloth worn by natives) shining brightly as he threw it farther over his shoulder.

'Why!' I exclaimed, 'it is Rainikoto himself—the very man I wanted.—Hi! Rainikoto, will you go pig-hunting with me to-night?'

'How do you do, sir?' he said with native politeness before he answered the question.—'What did you ask, sir?'

'Come with me to-night to look for that old boar that is eating up all your manioc, will you?'

'Where?'

'Oh, anywhere; I don't mind. At that little

open glade in the forest about a *rice-cooking** off, away to the east.'

'At the clearing to the east?'

'Yes.'

'I can't go; I have business to do.'

'Nonsense, man! What business can you have to do?'

'I can't go, sir,' he said again, squatting down on his hams beside me, and arranging his *lamba* so as to cover his mouth.

'But why?'

'I am an old man, and don't care for sitting up all night, as I used to do. I like sleeping better than shooting.—But what made you choose that place?'

'I thought it looked a likely spot, so many paths meet there.'

'Go about midnight; you are certain to see a pig,' he said, looking up with a curious expression.

I was surprised by the man's manner, it was so totally different from anything I had been accustomed to see in a native.

'Funny you should pick that place,' he added after a time.

'You seem to know it well, and say it is good; then why funny, my relation?'

'Oh, I know it very well.'

'I'll give you a dollar to come with me.'

The old man laughed. 'It is a big sum,' he said—'a week's pay. But not for fifteen weeks' pay would I come to that place at night, my master.'

'Oh, all right!' I said, pretending not to be curious. 'I'll go myself.'

I watched for some sign; but he sat looking out straight before him and evidently disinclined to talk. 'Is there a ghost there, Rainikoto?'

'Yes, perhaps,' he said, without moving a muscle.

'Have you seen it?'

'Yes, perhaps,' he again said, readjusting his *lamba*.

'Will you tell me about it?'

The old man sat perfectly still, as if in deep thought. No European could sit so long without moving. Not a limb, not the quiver of an eyelid. I waited for an answer, but none came. After a time, he took out his small polished bamboo tobacco-box. Shaking out a large pinch of the snuff-like preparation into the palm of his hand, he opened his mouth, and, by a peculiar jerk, tipped it in below his tongue—a decided hint for me that he meant to keep his story to himself, whatever it might be.

I knew it was no good pressing him then, so I lit another cigar and took no apparent notice.

Presently, native fashion, he spat out his tobacco, and seemingly addressing himself as much as

me, he began: 'White men don't believe in ghosts, and witchcraft, and *bagimla*;* they laugh at them, and at those who do.'

'Witchcraft, perhaps, my friend, and *bagimla* and *sikidy* [divination]; but we like to hear of ghosts. I do not feel at all like laughing; indeed, I very much wish to hear about it.'

It was a long time ago (he began so suddenly it made me start)—it was a long time ago; two kings and two queens have turned their backs upon us since then. I was but a little lad, but I remember it quite distinctly. I am old now; but I remember it well, as well as if it were only yesterday. My father was going into the Forest to get wood, only a short distance, so he took me with him. We had not gone far when we heard the long low whine of a lost dog. 'The board-hunters are out early,' said my father, evidently surprised; 'they must have slept in the Forest. Ho! è, è, è, è!' he shouted; but there was no answer except from several dogs, which joined in one long howl.

'Ah! they are all lost,' he said; 'and no one shouting to let them hear. Ho! è, è, è, è! Ho! è, è, è, è!'

Again the loud chorus came ringing and echoing through the wood. We turned aside, and made our way in the direction of the dogs. Cry upon cry now arose. I remember it well. Am I likely to forget it? It was early morning, and there had been a heavy dew; my feet were cold and wet, and the dogs frightened me. I felt chilled and scared. My father had girded himself, and his brown skin glistened in the morning sun. How fast he went!—pushing his way through the tangled growth. I could scarcely keep up with him, for the thorny creepers caught my legs, although my father helped to clear the way, striking with his axe at the great lianas that stopped our path. I think in the excitement he almost forgot me, for he guessed that something was wrong, and he held his spear ready shortened in his right hand. It seemed a long, long time before we reached the dogs. They were all together in the clearing to the east. It has not grown up as others do; it is just the same. There they sat, some howling, some licking the wounds received from a tussle with the board—

'Look, father! what is that?' I cried.

'À drè! à drè! It is a corpse. There are two: Rainimanga and Rainigapy—both killed by one pig,' he said, turning them over.

Ah! I remember them well, sir, these gashed bodies. It was a horrible sight for any one, much more for a little lad. The shaft of a broken spear lay near; and still grasped in the hand of one, lay the second spear. A look of surprise spread over my father's face as he gazed upon the man who held the spear.

'This wound would not have killed, and he never threw his spear. The other is nearly torn to bits! His spear has gone,' he said. 'I do not understand.—And what is this? Money! fifteen dollars!—How came that money here? Seven in one purse, and eight in the other.'

* A native way of measuring distance—equal twenty minutes; equal about a mile and a quarter.

* *Bagimla* are the supposed aboriginal inhabitants, whose graves and spirits are held in great awe and respect.

He looked at me, and then, as if thinking aloud, he added: 'No! I will not take it. It has bad luck in it. I'll give it to their wives. Besides, if I kept it, they would say I had killed these men. I wish I knew how they got it, though!'

We soon raised the whole neighbourhood. The two men had come from the village over yonder (he said, pointing with his lips to a village about three miles away)—and their friends went and brought the bodies in. What wailing and mourning there was! what beating of tom-toms! But the money my father gave up was much more talked about than the deaths. Never had any one but the chief—nay, not even he—had so much before. The funeral was very grand: several oxen were killed; and there was a lot of *toaka* [native rum] in *miny* [earthen water-pots]. The money was a great comfort to their wives. We heard soon afterwards that a trader from the coast had dropped his purse, and he offered a reward; but then the reward was less than the money in the purse, so of course he never got it.

I soon ceased to think of that day, though the shock lasted long. As I grew up, I, too, became a hunter and forester. Malagasy, as you know, are not fond of hunting like you white men; the Beganogand tribe are the most so; but even only a few of us care for it. I liked it, and soon became proficient. One day a white man came to our village and stayed there. He was looking for birds, which he skinned: he never ate them, which surprised us. He taught me to skin and shoot; and when he went away he gave me the gun. I was very proud of it; and soon I found I could get wild-pig much easier by waiting for them at nights and shooting, than by hunting them with dogs. So I used to go to the bush where you wish to go to, to-night.

He looked up at me with a sharp, keen, side-long glance, as if to read my thoughts, and then proceeded:

I nearly always got some, though you white men don't, for you have no patience; you sit and wait for one hour, perhaps, and then you get up and walk a little, or think another place better, or go home; but we Malagasy will sit without moving for hours. Whenever pig came this way, I was sure to be waiting for them, and the glade you mentioned was a favourite place. You'll see some to-night, sir, when you go, for I know their habits well. The herd that were in the sweet-potatoes and manioc last night, will come that way; they will be there about midnight, and return about second cock-crow.

His wrinkled old face broke into a sort of satirical smile, as he paused. Without knowing quite why, I began to feel 'creepy'; but I answered with apparent unconcern: 'Well, I hope so, Rainikoto. But you have not yet told me about the ghost, you know.'

'Oh, I shall. I am coming to it. But you had better go, and it will save me the trouble of telling you. You will see it all then for yourself.'

'I should like to hear it first, you know, to see if it agrees with what you saw.'

'Well, master, you are my father and mother, and I should like to please you; but it is a long story.'

'Go on, my relation,' I said, answering his politeness in the orthodox way.

He got up, readjusted his *lamba*, and squatting down a little more in front of me, began:

'It was on the 15th day of the moon Alahatsy—'

'Why! that's to-day!' I said.

Is it? (he said). Let me think. Yes; so it is. That is funny.—Well, it was on this very day, about ten years ago, I went to watch for pig at yonder glade. It was just such another night as this. The day had been very hot, and these little whirlwinds had been raising their dusty columns on the road—the spirits of our forefathers visiting the earth or returning to heaven, we Malagasy say. There had been a good many that day. I remember well. But they have not much to do with the story, nothing in your eyes.—A herd of pig had been among the village crops the night before. I had tracked them, and found out the way they had come. I noticed the slot of a huge boar, and I meant to have him. They passed right through the clearing. That glade has never altered, as the others do; it is the same now as then; and it was the same then as when I was a little boy; but it never struck me till after that night, and then I noticed it. The grass grows just the same, and the trees do not seem to change.

The old man, I noticed, was dropping into the native style of rhetoric, a form not unseldom heard in British pulpits, a certain reckless way of wandering up and down the keys of thought, and then the persistent striking of a single chord, with an emphasis varying directly as the number of repetitions.

Ay, it was just such another night as this, just the same; the same little fleecy clouds rushed across the full moon. The children were dancing in its rays, as they are now down yonder, and their song came rising and falling on the wind as now you hear it. The night was just the same; the crickets chirped and whistled in the grass; the great cicada rang his rattle as loudly as he now is doing—just the same. The dew was sparkling on the broad leaves, like tears on the cheeks of a young wife who has lost her child, her first-born. The frogs croaked in the marshes—a sign of rain, I've heard you say: we call it the women's parliament, for it is much talk and little meaning; for here, it is no sign of rain. Croak they will, as frogs and women always must. They could not live without it. Ay, master, the night was just—

'The same, my dear relation. Let us agree that the night was just the same,' I said, breaking in rather rudely, perhaps. 'The very birds, beasts, fishes, insects, you know, they always are the same, except when it is raining.'

'I said you would laugh at me. If you laugh already, what will you do before the end?'

'I laugh! My dearest father and mother, I am so anxious to hear the end that I have even been rude. Pray, excuse my haste; my eagerness outstepped my manners.'

Malagasy are not easily offended, and he soon went on again.

It was a short time before midnight that I started. I took my gun and spear and the usual little hatchet we all carry. No one went with me—I was quite alone. I soon reached the place,

and sat down, hiding behind a large clump of *sewa-be*, through the broad leaves of which I could watch the whole glade from end to end. It is about thirty *repy* [fathoms] long. The moon shone brightly; not a cloud obscured its rays; not a breath of wind could be felt inside the forest; but the tops of the taller trees rustled gently, and the twisting leaves showed their white linings with every little puff. The tree-frogs alone seemed to break the silence, for they alone were near me.

I had sat about two hours, and had seen nothing. I began to think the pigs must have passed out, or gone another way; and I had made up my mind to alter my position, so as to see them better when they came back in the early morning; but still I sat on, not caring to own myself at fault. I was just opening my tobacco-box, and had put my gun down by my side; my spear was sticking upright in the ground before me, and my axe on my knees, when I became conscious that something was going to happen, but I knew not what. I felt my head, to see if I were faint or dreaming. I never felt any feeling like it before, or since—a sort of trembling, cold, indescribable feeling, as if one's spirit were fighting with one's body. I was afraid, and thought I was ill—perhaps dying, perhaps bewitched; and I rose to go home. So disturbed was I, that I forgot to pick up my gun. Just at that moment a huge boar rushed past, his bristles all up, and his little eyes flaming from under his grizzled brows. He was covered with mud from head to tail; his jaws were set as if for fighting; he looked distressed, and evidently hunted, being hard put to it. He was the largest and oldest boar I had ever seen, for his horns* were very long and large, and his tusks gleamed long and sharp in the moonlight. I could easily have shot him, had I had my gun; but I was startled and surprised; and he was past before I regained my presence of mind. I held my axe, though, and without knowing what I did, I hurled it after him. Round and round it flew and lit a foot in front. I thought it must have grazed him; but he never stopped. I was astonished, for nothing followed; and a thing that did not strike me at once, but which I vividly recalled afterwards, was, that there was no sound; yet he had run right through some dry fern.

The old man stopped and altered his position. It evidently made him nervous to recall that night's adventures, even when sitting inside a veranda, and near one of the all-powerful white men. Glancing timidly over his shoulder, he began again.

I got up, master, and picked up the axe. For a time the funny feeling had left me, owing, I suppose, to the excitement; but as I touched the axe, my hand shook like a rush in the wind, and became as cold as the dead. I looked at it, to see if there was blood on it, and I ran my finger along the edge. It was the finger of the other hand, and it shivered like the hand that held the axe. I was horribly afraid now, and knew not what to think. I wished to go home; but I wished still more to know what had become of the boar, and what had chased it. I remem-

bered his enormous size, and I thought my eyes, being ill, might have magnified it, or that I had even seen a vision. I stooped down to examine the slot in the wet clay; but there was not a mark. I could not believe it. I knelt down and peered into the clay; not a sign. I was on the point of rising— Oh, sir, I shall never forget it. No! not to my dying day. There he was!—the boar! right on me, not ten yards off, and coming hard down on me—looking death in every line. I gasped, I shuddered; but I was still a man, and all my trembling ceased as I jumped up for one last effort. There was no room to move, for I had followed him out of the glade to that narrow passage between the high clay-banks; for there, if anywhere, I knew his marks would show. Five-feet perpendicular banks on either hand, and an immense boar in full charge. He had come without noise, or I must have heard him yards away. I had just time to get on my feet and strike at his head with the axe with all my force. I meant, as soon as I felt the axe bite, to jump high, and so miss the rush and tusks. It was no use to jump and not strike, for he would have turned on me again. I just saw his great red carcase as it loomed before me; there was time for much thought, but for little action. Down came my axe on his head; but there was no resistance! I lost my balance, for I had thrown all my weight on to the blow, and fell right on to the top of him.

I shut my eyes, and breathed a prayer to the Great Spirit to receive my soul. I knew I was a dead man, unless a miracle was wrought, for I should never be able to get up before he would be on me again, even if he missed me then. How long I lay I knew not; but at last I found I was lying unhurt in the path and no sign of the boar. I looked cautiously round without rising, in case he was there, waiting for me. Yes, there he was again—he, too, unhurt. How I ever missed his head I could not then imagine, for I was an expert axeman, and I saw the blade fairly on him. Some sudden twist had saved him, I thought. But what was he doing? I thought him mad. For there he stood at bay against a tree near the glade; but not a sound, not a grunt, rushing as if at dogs with all his bristles set. Look, master, I see him now!

The old man had got up; his eyes glared as his excitement increased, and I confess to having felt very uncomfortable myself.

Look! there he stands!—No! no! You can't see him, but I do. Yes! I see it all over again. I see him rushing madly at those phantom dogs, biting, goring, trampling, shaking them off; and then with one wild rush he broke his bay and ran right up to me—the spirit of my forefathers!—*right through me*, and only a shudder, a dull, trembling, cold, clammy shudder, as on he went. My hair stood on end; my tongue clave to the roof of my mouth—a horrid taste filled it; my knees shook; my heart leaped and bounded against my ribs, and I could not move. On he rushed. I watched him—ay, how I watched him! the great boar's ghost, for now I knew. Back again he came. He kept about the place. In desperation and half crazy myself, I gained strength to strike another blow. My axe passed through him, leaving a large gap, that closed again. My dread increased, and I thought I should have died.—Fifteen dollars, you say!

* The Malagasy wild boar has a large horn-like growth above each tusk.

Nay! not for all the money you have, would I pass that night again. It would mean death now, for I am older, and my heart could not bear the strain, even if that were all.

But there is worse, worse! I wonder I ever lived to tell the tale. The boar had broken bay twice, and was standing for the third time, when I saw two men run into the glade. They were girded tight, and had on the little straw skull-caps we foresters wear. They each had his spear raised, and rushed together towards the boar. I saw their mouths work, but heard no sound. They were both fine tall men, almost of the same height, and very like each other—for were they not brothers? I was then almost in a stupor from long-continued fear. I could neither move nor speak, only look. I wished to cry out, but could not, for I knew they must be the two men, Rainimanga and Rainigapy, whose bodies we had found dead years ago, when I was but a little boy. I knew I should see how it all happened now. I was close to where they passed, but they took no notice of me. As they did so, the same chill ran through me once more, as it had done when the boar passed by. As they ran on, an evil look came over the face of the hindermost. I never saw so fiendish an expression; all the evil passions man is prone to seemed stamped upon that face. Handsome as he was, he looked like a *kinoly*.*

I could see all plainly, for an artificial light lit up both the men and boar. The hideousness of the man's expression increased till he got within a few yards of the boar; then he leaped upon his brother from behind and seized his throat. Ah! what a fearful struggle that was! I shrieked and shrieked; but my mouth was parched, and the scream ended only in an uncertain sound. I tried to run and help, but I could not. I tried to shut my eyes, but I could not. Over and over the two rolled; but the vice-like grip never relaxed. The eyes seemed to start from the head of the one that was held; his face blackened, blood began to trickle from his mouth. It was horrible, horrible! A few moments more and all was over.

The murderer arose, gave one look at the corpse, picked up his spear, rushed at the boar, which still stood at bay. High above his head he raised his spear, poised it, gave it the twisting motion, and then, quick as lightning, threw it. It struck well, just behind the shoulder. With one savage bite, the boar severed the shaft and charged the man. In the murder of his brother he had forgotten his axe. The boar was upon him. One great shock, and his leg was ripped up as he turned to flee. Back again, another rush before he had recovered himself, and the tusks ran into the bone and severed the sinews. The man staggered and fell. He dragged himself slowly; but another rush of the huge animal and his side was open. Then the boar, with bloodshot eyes and staggering gait, ran away to die. I fainted; and when I recovered, it was dawn. For a year I was ill, and have never sat for pig in that glade since.

'That day was the 15th day of the moon, Alahasaty?' I asked.

He nodded.

* A kind of ghostly demon—the half-decomposed body of a man come to life again.

'I think, my dearest father and mother,' I said, 'you must have been asleep.'

Whereupon he shook his head, rose slowly, and departed.

ALLIGATORS AND CROCODILES.

No more striking illustration of the dangers we incur by interfering with the balance of nature could well be cited than the fact that the authorities in some parts of Florida have found it necessary to legislate for the preservation of Alligators. These hideous saurians abound in the Southern Mississippi and its tributaries; and when a use was discovered for their skins, even zoologists were not heard to protest against their speedy extermination. The reason of the prohibition is not far to seek: the cane-rat, which dwells in the swampy banks of the rivers, has increased proportionately with the destruction of the alligators, and threatens ruin to all harvests by the water-side. The result is that the authorities have passed a law forbidding the slaughter of alligators for the space of three years, under a penalty of twenty dollars; or a hundred during the breeding season.

The 'Alligator Mississippiensis' attains its greatest length in Florida, and specimens have been found twenty-three feet long. They do not appear ever to leave fresh water; during the winter they hibernate in the mud on the margins of their haunts. In the neighbourhood of Bazru Zara, on the Mississippi, vast flats of lakes and marshes stretch away on either bank; every year these are flooded by the overflow of the river, when they are visited by myriads of fish. The heat soon partly dries up these lagoons, leaving only about a few feet of water in them, thus exposing a vast amount of prey to the birds and alligators. In the deepest portions, quantities of these imprisoned fish accumulate, and these are known in the country as alligator holes. Thither the horrid reptiles crowd, and as evaporation proceeds, soon exterminate all the captives. Alligators feed principally during the night, when they are said to assemble in large herds, driving the fish before them into the estuaries. Alligators are very numerous in Mexican and Central American waters. The natives of Mexico, when they find an isolated alligator asleep, throw a lasso round its body, and, when secured, gag it. After this, the brute's career is terminated by repeated blows on the head. Another method is practised by the inhabitants of the banks of the Upper Orinoco. A tree is bent—generally, a bamboo is selected, from its elasticity—till the top is brought down to the butt; a bait is then placed on a sharp hook, the line attached to it being fastened securely to the small end of the bent tree, which is caused to relax its position by an ingenious piece of mechanism which gives way the moment the least strain is felt upon the line. The tree-point becoming thus released, straightens itself with great velocity, and drags the caiman from the water.

Various negro tribes place the alligator among their gods. In Madagascar, says the Rev. Mr Ellis, 'the natives invoke their forbearance with prayers, or seek protection from charms, rather than attack them; even the shaking of a spear

over the monsters would be regarded as an act of sacrilegious insult to the guardians of the flood, imperilling the life of the offender the next time, he should venture into the water.' In all heathen lands where alligators are found, more or less respect is paid to them, and savages are everywhere reluctant to kill them. According to the natives, they will seize white flesh in preference to black or brown; but a dog is asserted to be the caiman's *bonne bouche*.

The relations in which Crocodiles were regarded by the early Egyptians is not the least puzzling of the many problems that beset the Egyptologist. That they were worshipped is indubitable; yet what are we to make of that strange cemetery where countless thousands are entombed, the spaces between the larger specimens being packed in with eggs and little ones? Such numbers could not have perished naturally; and if they were objects of worship, it is clear they were not allowed to multiply unchecked.

One wonderful fact in the natural history of the crocodile was noticed by Herodotus, and though for a long time regarded as a fable, has been confirmed by modern research. The 'Father of History' tells us: 'When the crocodile takes his food in the Nile, the interior of its mouth is always covered with flies. All birds, with one exception, flee from the crocodile; but this one, the Nile bird, far from avoiding it, flies towards the reptile with the greatest eagerness, and renders it a very essential service. Every time the crocodile goes on shore to sleep, and at the moment when it lies extended with open jaws, the Nile bird enters the mouth of the terrible animal and delivers it from the flies which it finds there. The crocodile shows its recognition of the service by never harming the bird.' The fly alluded to is our common gnat, while the bird is a kind of plover.

Crocodiles are more voracious than alligators. Sir Samuel Baker says that many children fall victims every year on the banks of the Liamba when their mothers go to fetch water. The crocodile stuns its victim with a blow from its powerful tail, and then drags it into the river, where it is soon drowned. In general, when the crocodile perceives a man, it dives, and furtively glides away from the side which he occupies. Sometimes, on the other hand, it precipitates itself with surprising agility towards the person it has discovered, which may be noticed from the disturbance on the surface of the water.

One of the innumerable curious sights of India is the Nuggar tank of Kurachi. In former times, the crocodiles which inhabit it roamed the neighbourhood at their will, seeking whom they might devour; but so great were their depredations that the authorities were forced to build a wall round their haunt. This is a swamp, caused by hot springs, the medicinal virtues of which have been known from early times, and are attributed to the sanctity of a Mohammedan whose tomb is close by, and to whom the crocodiles are sacred. The tank, as it is called, is about one hundred and fifty yards long by about half that distance in breadth. In this space one observer counted over two hundred reptiles, from eight to fifteen feet long, and smaller ones innumerable. They are so tame, in a sense, that it is necessary to poke them with a stick before

they will move. Buffaloes are always standing in the water, and are not attacked; but any other animal is instantly seized. 'The whole appearance of the place,' says one writer, 'with its green, slimy, stagnant water, and so many of these huge uncouth monsters moving sluggishly about, is disgusting in the extreme, and it will long be remembered by me as the most loathsome spot I ever beheld.'

However necessary it may be to preserve alligators in Florida, there is little doubt that in other parts of the world the destruction of these reptiles would prove an unmixed benefit to the native population, ridding the neighbourhood of dangerous foes, and promoting a trade in the leather thus obtained.

IN THE VALLEY.

TO-DAY, when the sun was lighting my house on the pine-clad hill,

The bleat of a bird was ruffled as it perched on my window sill,

And a leaf was chased by the kitten on the breeze-swept garden walk,

And the dainty head
Of a dahlia red

Was stirred on its slender stalk.

Oh, happy the bird at the rose-tree, unheeding the threatening storm!

And happy the blithe leaf-chaser, rejoicing in sunshine warm!

They take no thought for the morrow—they know no cares to-day;

And the thousand things
That the future brings

Are a blank to such as they.

But I, by the household ingle, can interpret the looming clouds,

For the wind 'soo-hoos' through the keyhole, and a shadow the house enshrouds;

And I know I must quit my mountain, and go down to the Vale below,

For my house is chill
On the windy hill,

When the autumn tempests blow.

My mind is for ever drawing an instructive parallel

'Twixt temporal things that perish and eternal things that dwell—

When billows and waves surround me, and waters my soul o'erflow,

I descend in hope
From the mountain top

To the sheltering Vale below.

I go down to the Valley of Silence, where the worldly are never met;

I know there is 'balm and healing' there for eyes that with tears are wet;

And I find, in its sweet seclusion, gentle solace for all my care,

For that Valley pure,
With its shelter sure,

Is the beautiful Vale of Prayer.

A SIAMESE PAGEANT.

By DAVID KER.

THE two great festivals of the Siamese year—the White Elephant's birthday having not yet taken rank there as a Bank holiday—are the birthday of the reigning king, and His Majesty's visit in state to the chief local temples towards the end of autumn. I say 'the king' advisedly, for there is now but one, the office of 'Second King' having recently been abolished on the occasion of the late incumbent's death. This may perhaps be a change for the better, for the duplicate kingship produced at times some rather awkward complications, as in the case of a quarrel between the two monarchs, not many years ago, when the Second King rushed down to the English Consulate and put himself under British protection against the First King; while the First King locked himself up in his bedroom for a week for fear of being murdered by the Second King.

Our stay in Bangkok—which has superseded Siam's ancient inland metropolis, Ayuthia, as St Petersburg superseded Moscow—included both the great national holidays. In September came the birthday of 'the Golden-footed Prince and Lord of the White Elephant,' Prabaht Sombetch Phra Paramendr Maha Chulalongkorn Klow—may his life be as long as his name!—and a few weeks later followed the 'Visiting of the Temples.'

The birthday celebration was very well worth seeing, though some of its ceremonies were copied too closely from those of European courts not to appear somewhat incongruous in so thoroughly Asiatic a city. It was certainly no joke for us unfortunate Europeans to swelter beneath a tropical sun in full-dress suits of black broad-cloth, while waiting to offer our congratulations to the king. It fared even worse with the poor Siamese princes and nobles in their cumbersome dresses of coloured silk, stiff with gold embroidery; that worn by Prince Bhaskarawongse—which he afterwards showed me when I visited

his house—being so heavy that I could barely lift it with one hand.

But the great procession that followed a little later was picturesque enough to have atoned for much more serious hardships. Through the vast paved court-yard of the palace—above which its three successive roofs towered in one great blaze of green and gold—came, marching, to the music of a well-trained military band, a picked body of grenadiers in the uniform of the Siamese line—white frocks and sun-helmets, and blue trousers with a white stripe down the side. Then followed the scarlet jackets, and red morsehair plumes, and fine black horses of the cavalry of the Guard, succeeded by the Foot Guards in dark-blue coats, armed with English rifle. Behind these came the crew of the king's model yacht—about a score of bright young native sailor-lads, who looked very smart and 'ship-shape' in their British man-o'-war jackets. To them succeeded—as my English host observed with a grin—a regiment of genuine *infantry*—that is, several dozen tiny Siamese children, dressed as Highland soldiers—to our no small surprise—in the gay tartan of the Clan Stewart, which set off their solemn little brown faces very picturesquely.

And now a fresh burst of music heralded the arrival of the native grandees, carried by white-robed slaves in carved chairs of ivory or inlaid wood, under the shade of huge many-coloured umbrellas, which reminded us of those that we had seen overshadowing the black royalties of West Africa. Then followed the king's brothers, beneath still larger umbrellas fringed with gold; and finally—with a swarm of richly-dressed attendants before and around him, carrying bundles of rattans across the palms of their outstretched hands—appeared the king himself—a slim, rather good-looking young man of thirty—accompanied by three of his children, among whom the four-year-old Crown-prince is conspicuous by the tiny crown of diamonds which encircles his little top-knot of fuzzy black hair.

Altogether, it was a famous show; and the only drawback to its barbaric splendour was the group

of uncouth creatures in bottle-shaped helmets that guard the outer gate, whose brown, ape-like forms, clad in faded scarlet jackets trimmed with tawdry gold lace, were irresistibly suggestive of an organ-grinder's monkey.

That night both banks of the Me-Nam (Mother of Waters), which forms the main thoroughfare of this amphibious capital, were profusely illuminated, the very ships having every line of their hulls and rigging traced against the darkness in living fire. Conspicuous amid the swarm of crowns, arches, towers, stars, &c. that hovered phantom-like in the dark air, figured a monster letter-box formed by countless tiny jets of fire—symbolising the postal service recently established by the king through the interior of Siam—around which a ring of shining letters wished 'Prosperity to the King and the Postal and Telegraph Union.' A girdle of stars encircled the vast tower of the Wat-Cheng (Elephant Temple) on the right bank; and the tall spear-pointed pagoda that sentinelled the royal manseum stood out in one great spire of quivering flame against the vast gulf of blackness, like the red-hot pinnacles of Dante's infernal city glaring through the sunless gloom of the nether world.

A month later came the second and more characteristic of the two great national pageants—the 'Visitation of the Temples' by the king and his court—and, early on the appointed morning, in order to make sure of having a full view of the day's proceedings, we established ourselves, by the advice of a veteran English resident, in the court-yard of the most celebrated temple of all—the far-famed Wat-Cheng.

This eldest and most stately of the great temples of Bangkok is now fast falling to decay, the whole lower part of it being little better than an absolute ruin; for in Siam, as in Burma, no one ever dreams of repairing anything; and when any building—house, temple, or palace—begins to crumble away, the custom is not to restore it, but to build another in its stead. The damp, slimy pavement of the weed-grown court-yard is heaped with the remains of shattered cornices and fallen pillars; and stones, dust, and rubbish have choked up not a few of the small, gloomy cells that form a kind of cloister around the four sides of the quadrangle, which, once tenanted by yellow-robed Buddhist monks with shaven crowns, are now shared by toads and serpents, with gangs of native thieves.

Through one of the countless clefts in these mouldering walls struggles a stray gleam of sunshine, glimmering faintly upon the gilded fragments of the sacred images of Buddha, one of which has a somewhat curious history. Between two blocks of stone in the niche where it used to stand may still be seen a narrow opening, not unlike the slit of a letter-box, into which once fell the offerings dropped through the mouth of the idol by the rich, and subsequently taken

out from behind by the poor, in the belief that the holy image itself sent them the money. But in process of time, when the temple began to decay and to be deserted by its richer worshippers, the contributions gradually ceased; and then the poorer folk, finding that their idol had suspended the payment of his periodical dividends, avenged his remissness by breaking him in pieces on the spot.

This abode of desolation, however, has still some inhabitants of its own, of a very appropriate kind. As you pick your way amid the heaps of ruin, grim-looking warriors start up before you with brandished weapons, and hideous monsters threaten you with greedy fangs and uplifted paws. But no sound issues from the gaping jaws—the ponderous clubs never fall, the menacing claws never strike; all are of cold, hard stone, like the spell-bound guardians of some enchanted palace, awaiting the destined champion whose coming shall arouse them from the torpor of ages.

When you stand at the foot of the great pagoda itself, you seem to be looking up at a mountain of living rainbows, flashing and quivering incessantly like falling water; and it requires some time to grasp all the details of this singular structure, seemingly so magnificent, but really so mean and poor. Around the central tower stand ranged like a life-guard four massive pagodas of the bell-shaped pattern, so universal both in Burma and Siam, each ascended by a steep narrow stair, and all four inlaid with coloured porcelain, while above them a mighty pinnacle springs up into the sky like an embodied prayer, to a height of more than two hundred feet.

At the first glance the blaze of many-coloured splendour that lights up this tower from base to summit might lead one to suppose it thickly set with precious stones, or at least inlaid with the costliest porcelain. But the admiring spectator is grievously disillusionised when he comes nearer to it, and sees that this show of glittering magnificence is produced merely by countless fragments of common earthenware plates dabbed into a thick coating of stucco, like almonds in hard-bake!

Between the sentinel towers, the pyramidal sides of the structure slope upward in one great mass of sculptured archways, painted crockets, carved cornices, and scale-shaped tiles of green and gold, rising terrace above terrace, without order and without end. Ever and anon start up weirdly through this wilderness of gorgeous hues a long line of goblin forms in many-coloured robes and pointed caps, whose uplifted arms seem to support the projecting cornice overhead—intended to represent angels, though their black, misshapen visages and huge tusks make them look more like devils.

In the court-yard of this strange place we posted ourselves on the appointed day, to await the coming of the king and his suite. We had no lack of company, for the whole enclosure, so voiceless and deserted at other times, was now full to overflowing. White-frosted slaves; hel-

meted soldiers; doll-faced Chinamen in huge straw hats; blue-coated Guardsmen; stunted, greasy market-women with hair cropped as short as the bristles of a scrubbing-brush; bare-limbed peasants from the rice-swamps, whose dark skin was covered as with a blue gauze veil by the elaborate tattooing which their superstition believed to be a sure charm against all weapons; and children in the native full-dress of a string of beads round the neck and a brass ring on each wrist caddied around us like a sea.

Thanks to the kindness of the Siamese Cabinet Ministers, room had been made for our party—which included the British Consul and the American ambassador, General H—, on a raised stone platform occupied by themselves, close to the spot where the king was to land; and from this point of vantage we beheld not a few spectacles which, however common in this strange region, would be abundantly startling anywhere else.

Just in front of us halted a native boat, one of the crew of which, while rowing, had held between his toes the 'buri' or native cigar that he had just been smoking, formed of a huge reed stuffed with tobacco. In an open space a little to the rear of the seething crowd around us, a group of supple, slender-limbed native children, with nothing on but a wreath of flowers around their solitary 'head-tuft' of bristly black hair—the cutting of which is to a Siamese boy what the putting on of his first tail-coat is to an English one—were playing a kind of Orientalised lawn-tennis with a ball of palm-pith, which they struck to and fro, not with their hands, but with their feet, using the sole and the instep with equal ease.

A little farther on, a small Siamese cottage of plank and shingle was coming gravely up the river by itself, steered with a huge clumsy oar by its proprietor, who stood on the wooden stair in front of the door with his children around him. One of these—a little mite barely old enough to walk alone—suddenly tumbled overboard, but, apparently not a whit discomposed, coolly swam after his locomotive home, and scrambled up again to the side of his philosophic father, who seemed as little disturbed by this incident as the hero of it himself.

But all at once a buzz of excitement through the crowd, and a general turning of heads up the river toward the palace, warned us that the 'Procession of Barges'—the great show of the day—was just coming in sight. And a gallant sight it was. The king's state barge, which headed the procession, was one blaze of bright paint and gilding throughout its entire length, which was very considerable, for it was rowed by a hundred men, all as gorgeous as tropical butterflies in their uniform of scarlet and blue, which are the royal colours of Siam. Bow and stern alike were one mass of gilding, and twisted into fantastic curves, which glittering in the cloudless sun, might well have been mistaken for the coils of a monstrous snake; and over the stern hung, by way of ornament, the tail of a 'yák,' the famous 'grunting ox' of Tibet. Near the bow stood a richly dressed personage, who seemed to act as boatswain, and regulated the movements of the oarsmen by thumping against the planks upon which he stood the end of a long bamboo which he held in his

right hand; and just behind him was planted a small cannon, as if to shoot him in case he neglected his duty. After every stroke, all the hundred rowers shot their broad-bladed oars into the air at once, with a sudden jerk, the effect of which—all the oars being profusely gilded—was like that of a flash of lightning.

Just amidships, beneath a small open-sided pavilion loaded with barbaric ornaments, sat the young king himself, with the pagoda-shaped crown of Siam upon his head. This crown is only worn once in three years, which is just as well for the unfortunate wearer, its weight being fully thirty-six pounds English; and were it to fall off, there is no saying what might be the consequence, only one official in the whole realm being empowered to touch the crown, which even the king himself must not do. In fact, the dilemma is the same as that of the luckless king of Spain who was burned to death because the proper officer was not at hand to put him out. Following the king came the boats of the various princes and nobles, similarly decorated, the crews being as gay as a flower-show in their dresses of bright yellow, green, blue, or crimson, to which the dazzling sunshine did full justice. But one and all kept at a respectful distance from the king's barge, it being ordained by law that the crew of any boat daring to run against that which carries the person of Siamese royalty, shall all be beheaded on the spot; and though this humane statute has lately fallen into disuse, the native boatmen had evidently a wholesome fear of seeing it suddenly revived for their especial benefit.

On landing from his barge, the king was borne into the court-yard of the ancient temple upon a kind of litter; but the same distinction was not extended to all his numerous brothers, three or four of whom—strapping lads of fifteen or sixteen—were carried like babies in the arms of their native attendants, with their bare brown limbs dangling down in a queer, helpless fashion that recalled to me how I had once seen the august governor of an African colony dragged out of the surf on to the beach, with his feet higher than his head, by the black hands of three or four stalwart negroes.

As the Lord of the White Elephant went past, the native spectators, to a man, went down on their hands and knees and bowed their faces to the very dust; and at the same instant I myself performed an equally low prostration without intending it. One of the Siamese Ministers—a corpulent old fellow with a broad, heavy, good-humoured face—had just offered me a light open-work iron chair recently imported from Paris, which shut up like a penknife the moment I sat down upon it, and sent me rolling in the dust, to the immeasurable delight of the bystanders. The only thing to be done was to get up again and join in the laugh; but hardly had I done so, when down went the old Minister himself in turn, in precisely the same fashion, and lay sprawling on his back in the dirt, his great bulk and weight making it no easy matter for him to rise again.

How much of this absurd scene the king had witnessed, I cannot tell; but I afterwards learned that he had singled out my wife and myself as new faces in the Ministerial circle—for he was already familiar with those of the Consul and the General—and had asked one of his courtiers who

we were. The latter answered—there being naturally no Siamese equivalent for 'newspaper correspondents'—that we were 'people who made marks on paper'—a not inapt definition of a good many authors of the present day.

POMONA.*

CHAPTER VII.

Henceforth my name has been
A hallow'd memory like the names of old,
A center'd, glory-circled memory,
And a peculiar treasure brooking no
Exchange or currency.

TENNYSOON.

'I THINK,' Owen Ludlow said to himself a fortnight later, contemplating his picture with a strange mixture of irritation and amusement, 'that something fresh has been imported into this, besides the recognition in the girl's eyes. It really is hard lines on a fellow to have the whole intention of his work altered in spite of himself, without either with your leave or by your leave; and it's not quite fair on the story which the picture is meant to illustrate. There is not the slightest hint in the mythological dictionaries of any other girl looking at Vertumnus with eyes like that. Recognition indeed! it might have been so a fortnight ago; it means a good deal more now; and it upsets the balance of my picture too, for I don't believe, if Vertumnus had looked away from Pomona for a moment, he would not have been fascinated by those sweet eyes. I think I have made Pomona a shade too unconscious of Vertumnus. I don't believe, beautiful as she is, that in real life such sublime unconsciousness would have had a chance against the feeling in the other's eyes. Those are unconscious, too, of their own meaning, but vividly conscious of him. Pshaw! Why can't I paint as I please? a touch here, a shadow there; and surely one can alter the expression to anything one pleases; but try my hardest, I can't fetch that look out of the girl's face in the picture, any more than I could in real life.'

And here the painter left off contemplating his own picture, to look at another that he could see through the middle window of the large bow, the apple-tree without the fair figure of Pomona, but with Vertumnus smiling down at Sage as he dropped the rosy apples he was gathering from the boughs over her head, into her skirt, held to receive them.

Sage had given a little sigh to herself that first evening of Maurice Moore's arrival; for she thought that Owen Ludlow would no longer care for her company, and the sittings would most likely be discontinued. But Owen would not hear of such a thing; nor, when she came, would he let Maurice slope off along the cliff with his pipe and a novel, as he once or twice made a very mild feint of doing, to leave the sittings undisturbed; and often the painter would cut short the sitting, and propose that they should all adjourn to some favourite haunt of his on cliff or shore; or that Sage should show Maurice the way across the cliffs, or scramble with him across the rocks at low tide to some little bay or cluster of fishermen's cottages.

Altogether, I don't think Owen Ludlow need

have been so much surprised at that look in Sage's face, for if he had been the most designing, match-making mother in society, and Maurice had been the biggest catch in the matrimonial market, and Sage one of six daughters awaiting promotion, he could hardly have thrown them together more artfully. One would have thought that fifty years' experience of life might have taught him what to expect when a young girl was constantly in the company of such a good-looking, agreeable, young fellow as Maurice Moore; and perhaps if there had been a mixture of the tenderer feeling in Owen's friendship for Sage—and, in passing, I must protest against my own use of the word 'tender' as applied specially to love, seeing that friendship is often far tenderer—he would have been more alive to the danger, jealousy being keener eyed and more nearly allied to love than to friendship. But how could he have foreseen, he protested to himself, that Maurice would have looked twice at such a quiet, little thing as Sage, in her shabby serge frock, with her simple shy manners, when he was used to fashionable society, and was continually brought in contact with beautiful and elegant women? Why, ten years ago in California, when he was little more than a boy, he had had more love affairs than Ludlow had thought possible in the course of an ordinary lifetime; and since then, every time he and Ludlow had met there had been some affair of the heart more or less serious, generally less, to relate.

But who would have thought that he would have noticed little Sage? whom Ludlow, fond as he was of her, had never till now thought at all pretty, and who indeed was not so. But now Sage seemed suddenly endowed with something curiously like beauty, whether from the new expression in her face, or from Ludlow seeing her with Maurice's eyes, as one so often sees people and places from another person's point of view, sometimes getting sudden new revelations in this way about faces or scenes one has known for years with a very different impression.

He, certainly—and Maurice told him so plainly—had not done her justice in the picture, and this went to prove that it was not the new expression alone that had beautified her, for that had found its way, against the painter's will, into the picture.

Well, anyhow, the painter told himself, it would soon come to an end. Maurice would have to leave in two days, and the boys' holidays were nearly over; and Sage would go back to London to the old life of ordering dinner and mending the boys' socks, and this would be only a pleasant, bright memory, with Maurice Moore a picturesque figure in the foreground.

It was no use turning crusty now, and making himself disagreeable and spoiling sport for these two last days, and yet that look in Sage's eyes in the picture and in reality made him uneasy, as meaning something more than being 'the summer pilot of an empty heart unto the shores of nothing,' and as showing great possibilities of happiness or heartbreak as circumstances might dictate.

But he was not left long to his reflections that afternoon, for his studio was invaded by a company armed with crooked sticks and baskets and a black kettle of noble proportions, for all the world was going blackberrying to the Landslip,

* Copyright reserved in the United States of America.

Mrs Rockett having undertaken to make as much jam as they could find blackberries and jars to contain it.

The Landslip is about three miles along the coast from Scar, where some years ago a large piece of the cliff fell in the night, leaving a great chasm, with rocks and masses of earth heaped up anyhow in very chaotic fashion, which nature, year after year, in her gentle, kindly manner, was trying to restore to order, clothing the torn, rugged blocks with lichen and tufts of fern and trails of ivy, carpeting the hollows with moss, filling up nooks with the stinking iris, which is pretty enough to deserve a prettier name, though I am bound to confess it also merits that one, and which just now was beginning to split its seed-vessels and show the coral berries inside. Some of the trees had come down in the slip from the level of the cliff above, and must have felt sadly shaken, and are in queer positions with twisted trunks, straining to get back to the perpendicular, and over these, and over the young growth of beech and ash saplings and nut-bushes, has been thrown a tangle of rose branches and brambles and clematis, the last enacting the part of old-man's-beard now, instead of the fragrant traveller's joy of the summer.

Here and there, out of the thick undergrowth, rose rocky islands, which had resisted the general downfall, and reared up rough, rugged blocks, as if in defiance of the smoothing influence of nature; and on one of these Ludlow took his seat when his blackberrying ardour had abated, which soon happens at fifty. Sitting up there, he looked, Maurice said, like the cormorant on the tree of knowledge in the garden of Eden, or the little cherub perched up aloft; and from that elevated position he could command the length and breadth of the defile caused by the landslip, and could catch occasional glimpses of the rest of the party among the bushes, or in the little oases of open space, and could hear the boys shouting to one another.

'Oh, I say, come here! here's a jolly lot!'

'Hullo there, Dennis, where have you got to?'

'Kitty, Kitty, come on, can't you?'

Shouts that gradually grew fainter as they went farther down the Landslip.

That idea of the cormorant had naturally suggested to Ludlow's mind that first pair of lovers in Eden; and a glimpse of Maurice and Sage as they passed down a little glade together, fitted in so well with the rest of the picture, that he smiled to himself in half-irritated amusement. They did not seem to be doing much blackberry-gathering. Maurice used his crooked stick to clear the branches out of Sage's path; and sometimes they stood for a few minutes under a bush, which I am sure Kitty or the boys would have gathered a harvest from, and strayed on again without adding one to the very modest heap in Sage's basket.

It was all so new to Sage; the ordinary courtesy of a young man to a girl was as yet quite an unknown thing to her; not that Dr Merridew would ever allow the boys to be rude to her; and he himself treated her with an old-fashioned, chivalrous respect; but the treatment most girls are used to in society, being waited upon and

taken care of, Sage had no experience of; and even Owen Ludlow's treatment had not quite the same flavour.

The situation had not the same novelty to Maurice. As I have said before, he had had many affairs of the heart, and, I am afraid, had often and often gone much further than he did to-day with Sage in the Landslip without the heart being concerned in the affair at all; but there was a charm in little Sage, with this new evanescent beauty about her which love confers; and there was a sort of fitness and tranquil appropriateness about her surroundings that took his fancy and pleased his taste; and fancy and taste make up a large part of many men's hearts, and of some women's, and with them you have to cut down deep through the white sugar and almond paste before you come to the cake itself; and many people think the almond paste the best part of the business.

'Hullo! Hullo! Hullo!' The cormorant on the tree of knowledge is summoning his widely scattered party for tea.

'Tea-time!' Sage exclaims.—'Why! we were not to have tea till five.'

'And now it is half-past,' says Maurice, looking at his watch.

They could hardly believe two whole hours had passed since they reached the Landslip; and they looked a little shamefacedly at their basket, which hardly contained enough blackberries to conceal the bottom.

'We must have upset the basket getting through those bushes,' Sage said.

'Or, perhaps,' he suggested, 'the boys have been along and picked all the blackberries.'

There must be something to account for the emptiness of the basket.

'Coo-ee! Coo-ee!' The painter's sonorous voice rings out, and is echoed among the rocks, and brings back an answering shout from far-away Dennis and Nigel and Will; and a shrill little 'Coo-ee' from Kitty, nearer home.

They have all much farther to come back than Sage and Maurice; and yet, when these two loiterers arrive at the great flat slab of stone on which the fire has been built up, they find all the others collected, and a brisk fire burning under the kettle, hung in gypsy fashion on sticks over the blaze. Gypsy teas have been so numerous since they came to Scar, that the children are all quite equal to the occasion, and none of the catastrophes happen that used to be so frequent at first—important articles such as matches forgotten, damp wood, upset kettle, smoky water, and ant-hills chosen for seats. To-day, the spot chosen was most judicious, as the smoke curled away up between two upright stones that formed a natural chimney, and did not come straight in the faces of the party, as often happened.

Sage had arrived too late on the scene to undertake her usual office of unpacking the baskets and making the tea, as the boys had undertaken the former duty with great bustling; and Kitty was presiding over the teapot with much importance, and resentment at any interference.

So Maurice found Sage a seat among the mossy stones, where she sat at ease. She had taken off her hat; and her head with its soft plaits, from which little rings escaped wherever they got the

chance, was resting back on a cushion of moss. There was a little colour in her usually pale cheeks, and a soft radiant light in her eyes, and such a look of great content when Maurice settled himself at her feet, that Ludlow's uneasy feelings revived, and his attention was so distracted that he let the kettle boil over and scalded his finger. He cast such wrathful glances at Maurice, that that young reprobate, out of mischief, threw still greater *empressment* into his manner to the girl, and looked up at her with more sentiment in his dark eyes, and sank his voice to a softer, more confidential tone, so that the painter could not hear the words, which were matter-of-fact enough, but only the tone, which was lover-like.

September days are short, so the sun was setting before tea was done, glorifying the whole place with crimson light, shooting shafts of liquid gold between tree-trunks, bringing out wonderful tints, deepening blue shadows, sharpening outlines, and, overhead, sprinkling the sky with little pink butterfly clouds, turning golden as they neared the west. It was one of those exceptionally beautiful sunsets that come now and then to make us look up from the mud and above the brick walls which bound our view in ordinary life.

Ludlow's attention was distracted from his displeasure with Maurice, and Maurice ceased to wish to aggravate Ludlow; the children left off wrangling over their blackberries, and even the boys sat with their knees drawn up to their chins, staring at the gorgeous panoply; and Sage, leaning back luxuriously on her mossy cushion, felt that the loveliness was almost more than she could bear; but with her, poor child, I think anything seen as that was, over Maurice Moore's dark head, would have seemed beautiful, and life a dream of happiness, with him sitting at her feet.

When the spell was broken at last, when the boys jumped to their feet, clattering plates and cups in preparation for packing, and the painter stretched himself and said they ought to be getting under way, and Maurice got up and began rolling a cigarette, Sage drew her breath sharply with almost a sob in it, as if she had been drinking in the beauty breathlessly. If every one would have sat still, if Nigel had not suddenly flung up his heels in the air, and Will tried to balance a saucer on his nose, it seemed to her as if those ecstatic moments of sunset might have been prolonged indefinitely; but the stir seemed to end it; the sun dipped petulantly behind a cloud, and immediately the colours began to die and deaden, and the shadows grow ashen and dull; and a mist became apparent, rising from the bottom of the Landslip where the irises grew.

'We are going home over the cliffs,' Kitty said, taking possession of the painter's arm; 'and you are going to tell us all about that prairie fire from the very beginning.'

So Ludlow, who had meant to act the dragon on the way home, and keep Sage tucked under his arm, was marched off with Kitty on one side and Nigel on the other, and Dennis and Will circling round, or walking backwards in front of him.

So Ludlow had to resign himself to circumstances, and presently got so interested in his

story, that he did not think of Sage and Maurice till he reached the path leading down into Scar, when he became conscious they were far away behind, only dimly to be made out in the moonlight on the cliff.

There was some excuse for loitering on such a night, with that broad rippling silver band drawn across the dark sea, and the great, gentle moon beaming down at them, with a soft bright star to share her solitude in the quiet blue vault. From the shore below, the wash of the waves on the beach hardly broke the silence, which was so deep that they could hear the sheep cropping the short grass on the cliff behind them.

Maurice had been helping Sage to climb a steep little bit of the path—Sage, who had never been helped over any rough or steep bits of life before, having generally to drag or push some one else through difficulties—and he did not leave go of her hand when the steep part was passed, but kept it in his, and held it still as they stood looking at the moonlit sea.

He was telling her, with a regret in his tone that was infinitely sweet to her ear, though his words themselves were of the parting that made her heart sink, of his going away to the noisy, restless, society life, to the pretence and push and unreality, to the heart-burnings and jealousies, to the petty spite and paltry ambitions. He spoke of it all with such contempt and weariness, that no one could have imagined, least of all that most credulous listener whose little hand thrilled in his, that he had found this life very endurable a few weeks ago, and most probably would return to it without too great repugnance before many days were over. But he really did mean it at the time very heartily, quite as much, and perhaps more than he had meant many another tender little sentiment or softly murmured compliment in other equally romantic situations as this on the quiet cliff, with the great stretch of sea, 'that moving seems to sleep,' before them, with the broad silver stripe of moonlight across it.

So also he meant it entirely when he bent nearer to her and clasped her hand more tenderly and said: 'I shall never forget this happy time at Scar. It has been the happiest fortnight of my life.—Sage, will you forget me quite when I am gone?'

He had never called her Sage before; and from that moment the name was altered to her, sweetened, glorified, so that she could never hear it from the most indifferent lips, or write it in the most commonplace business of life, without feeling a little thrill of pleasure.

She did not answer his question. How could she, with her heart beating in such great happy throbs? But perhaps it did not want great self-assurance or conceit on Maurice's part to guess what the answer would have been, from the tremble of the hand in his, and the eloquent silence of the small face so fair in the moonlight.

After all, what had he said, and what had he done to feel any compunction about? he asked himself with irritation when he had parted from her at the cottage door, when the children's noisy narrative of the events of the day to Mrs Rockett, and display of the blackberries they had amassed, cut short the parting, and made it too public for

tenderness. It was only that he had meant it a little more, and she had believed it a little more than had happened on other occasions; when he had had a turn at that fascinating sport of fencing which we call flirtation, a charming diversion, elegant and amusing, and no harm in it, thrust and parry, point and tierce. But have a care! All of a sudden the button is off the foil; the game is turned into deadly earnest, the elegant diversion ends with a death-wound.

'Pshaw!' he said, impatiently, 'where's the harm?'

And yet, as he came into the studio, where the painter sat smoking, with a book in his hand, he felt unaccountably ashamed, and inclined to be apologetic.

THE BIRTH OF THE MECHANICAL POWERS.

THE tendency of modern research is to establish the proposition that human society is an organism which has grown to a complex form out of simple beginnings. It is difficult for the trained intellect of to-day to form a mental picture of the untrained intelligence of the earliest men, and the language in which we express that primary mental condition does not convey exact notions to the mind. It is harder to imagine than to describe a mind with no logical thought, and no knowledge of natural facts, still harder to conceive with what slowness any progress ever took place. Yet, as we travel back upon the historic past into the region of pre-history, we at length encounter men around whom and in whom there played physical forces of which they had no comprehension. Logical inference supports written tradition in saying that the remotest men had to start in life with no stock in trade but a group of faculties which as yet were wholly undeveloped.

These earliest men found themselves environed by the facts of life; and it was the observation, not only of natural events, but of the ways of other sentient beings, and themselves, which first taught them the rudiments of mechanics. There is a fable which, like most, has a philosophic basis, that men first learned the art of swimming by watching the instinctive actions of a young frog. A popular writer published some years ago a collection of instances in which human inventions were anticipated by the blind instinct of beasts or herbs, and has shown, for example, that the aquatic plant known as *Utricularia* applied the principle of the crab-pot ages before ever an archaic fisherman caught crabs by that means. And there is no doubt that in many cases the slow, half-intelligent perception of the methods adopted in Nature for achieving mechanical results was one chief source of instruction for the earliest engineers.

The axiom that example is better than precept is one which has exerted an immense influence upon social evolution, and that influence made itself felt in two ways. Some particular man would happen to do a certain thing, probably by accident, and others who noticed it would be at once filled with the desire to imitate it. In certain French watering-places, three or four years ago, there arose a fashion amongst the women of

wearing gloves of different colours—for instance, a black glove on the right hand and a white glove on the left. This practice owed its birth to the fact that at a certain concert early in the year a leader of fashion appeared in the room wearing old gloves in this way. She had put them on unconsciously, and was horrified when she discovered her blunder; but the other women present at once imagined that this was the new *mode*, and it was instantly adopted. In ways just as accidental, individuals who had acquired a reputation for special wisdom or aptitude would in early societies become at once objects of minute imitation.

All mechanical labour must in the nature of things start from the foundation afforded by the human hand. But men would live in the world a very short time before beginning to see that many mechanical enterprises required a greater hand-power than that of a single man. The inference suggested by a study of the human remains of the glacial drift is that, from the very first, men turned themselves into a sort of compound machine by pulling together. Two facts conspired to impart to this act a peculiar development. The innate distaste of men to use their own hands on the one side, and the need for disposing of prisoners taken in war on the other, would, in an age of physical struggle, when one race could hope to exist only by effacing another, lead conquering tribes to utilise the accumulated energy of living captive men. In this sense it may be said that the first machine ever invented was a slave-gang, and the first engineer its taskmaster.

But besides the energy obtained from men, early engineers were not slow to utilise the power stored up in other animals. There is evidence that even in the palæolithic age the art of domesticating animals was already in vogue; and one of the earliest scratched bones extant—the remote precursor of all pictorial art—represents a man in the act of guiding a rude lopped pole, drawn by a horse, as a sort of primitive plough. The fact that in the Danish 'kitchen-middens,' or rubbish-heaps, all the marrow bones are found to be split and gnawed, is regarded as proof of the existence at that time of a breed of domestic dogs. The ass, also, as far back as Semitic traditions go, was a beast of burden in Western Asia. When it is remembered that the ass is regarded as capable of five times the work that can be done by a man, and that the horse is ten times as powerful as a man, it will at once be perceived that the adoption of these animals as prime movers would add immensely to the mechanical capabilities of early engineers.

The precise relative date at which water-power first came into use cannot be asserted. Amongst the remains of the Stone Age, from the earliest to those which, from their superior finish and more perfect adaptation, are thought to be later in point of time, there is no class more frequent than that of mortars and pestles. Sandstone blocks, or querns, bearing hollows which have about them the aspect of having been formed by the pounding of corn upon them, have been often found, and the whole inference is supported by other considerations that during the age of Stone the water-wheel as an agent for grinding corn

was not yet invented. The utilisation of human energy involved in the grinding of corn by hand was in fact replaced by that of quadrupeds long before horse and bullock power gave way to water-power. Cattle-mills, for instance, were in use amongst the Romans at an early date. It is difficult to suppose that the first inventors of the water-wheel used it for any purpose other than grinding, and the inference is that mills driven by this power were of relatively late origin. There is reason to believe that the Egyptians had water-wheels in use in very early times; and one is known to have been erected on the Tiber in the century before Christ. The first water-mill known in history is that described in connection with the Mithridatic wars. The tide-wheel is of quite recent origin, none being recorded earlier than those used by the Venetians in 1078 A.D.

Windmills, also, were not known in Europe before the twelfth century, but are believed to have been in use in the East before this time. A sawmill is recorded to have been in use in Augsburg in 1332. The fact that of all modern African races not one has ever hit upon either water-power or wind-power seems to prove that they involve a knowledge of advanced kinematics not attained by any races out of the track of the early civilisations.

Although the property of rubbed amber was perceived by Thales as early as the seventh century before Christ, yet it need scarcely be said that heat and electricity, as practical prime movers, are developments of the past two hundred years.

Let us now examine one by one, in the order of their birth, the mechanical powers which are described as the simple machines. Here it may be observed that whereas some of the lower animals do possess a knowledge of individual powers, yet, if those particular powers fail, they are incapable of carrying out their desires by other means. Monkeys, for instance, fetch themselves cocoa-nuts and break them open at the same time by running up the palm-trunks and dropping the nuts to the ground. But if a nut should fall intact, the monkey would not have the cleverness to pick up a stone and break it; nor has it the aptitude to throw a stone upwards, and so bring the nut to the ground. Both these actions would imply the pre-requisite of an opposable thumb. Similarly, a beaver will drag a tree-trunk to the river-side, that it may be built into the beaver-dam; but if the trunk be too heavy, it will not have the power to put one trunk on another, and so roll the trunk along.

It is in this capacity for inventiveness that the divergence of human aptitude from that of animals is to be found. Thus, there is no record of any brute creature ever deliberately and of set purpose transporting a weight from one point to another by rolling it down a hill. Yet the savage race does not exist which is incapable of this simple exercise of the inventive mind. Again, there is no record of a savage who would not be smart enough to drag one trunk over a smaller one, and so lessen the friction of transport. It may be taken for granted that the roller, in the form of a pole from which lateral branches had been lopped by cutting, breaking, or fire, was one of the earliest mechanical inven-

tions. It would not be long before men perceived that by reducing the bulk of the trunk in the middle, the power of the roller was increased, because friction was reduced, and in this way the middle part of the roller would at length develop into the axle, and its two ends into wheels. There is no evidence that trollies or carts of this rough pattern existed amongst the men of the Stone Age, and the theory that they had not yet been invented is strengthened by the fact that stone implements would have been incompetent to fashion a wheel. The earliest Chaldean monuments bear sculptured representations of rude wood-carts with two fixed wheels drawn by a single ox; but these very sculptures themselves prove that metallic tools were in use at the time.

The lever must be quite as old as the roller. When several felled poles lay together helter-skelter, one of them would most likely have one of its ends resting under another, and accidental depression of the free end would reveal the fact that heavy weights might be moved by pushing under them one end of a pole, and pushing under the pole another by way of fulcrum. The transport of heavy weights, therefore, might take place quite naturally amongst the men who preceded the metallic age by the use of poles as levers and rollers. At that stage nothing in the way of a crank or axle would have been known. The lever, like other powers, was of course known long before its properties had been investigated by the mathematician. It was, in fact, not until the time of Archimedes that the lever was explained.

It may be useful here to point out that in the pre-metallic age, before nails were possible, fastenings were effected by means of knots. The older stone implements are distinguished from those of the newer age by having been lashed to a wood-shaft with leather thongs; whereas, later on, men found out how much better it was to make a hole, either in the stone head or in the wooden handle. The fact that stone implements are found scattered singly here and there seems to suggest that they had slipped by accident out of the shafts through unskilful tying; and from this we may infer that the granny-knots and other unscientific methods of tying which children instinctively adopt are a relic of the Stone Age fastenings.

From the position in which their remains are found, it may be said that the Stone Age races of Western Europe obtained their supplies of fresh water from running streams and lakes. They would therefore have no knowledge of artificial wells, which seem to have been hit upon by Syrian nomads in very early times. At first, perhaps, vessels would be lowered by a thong, and then pulled up again; but if a pole were placed across the well-mouth for purposes of safety, men would at once see the advantage of pulling the rope against the pole. Later on, they would acquire the means of fixing the pole in the holes of vertical boards, and so the pulley would arise. Even before this invention, it is probable that men hit upon the plan, when dragging a heavy weight by means of a leather thong, of passing the thong round some handy tree.

The precise manner in which the wedge was invented cannot be shown. Perhaps some archaic

workman, hammering away at a block of wood with a flint knife, found the knife enter the wood and become fixed. In the effort to wrench it out, the block would split. This theory is strengthened by the fact that the invention of the axe and the wedge is ascribed to Daedalus. Such a belief on the part of the Greeks was but one way of saying that those implements had been handed down from a time which to them was one of remote antiquity; and the juxtaposition of the axe and wedge is a confirmation of the idea that both originated under one set of circumstances.

While the engineer of to-day is a being of a very different stamp from the engineer of the long-ago, the difference is one of degree rather than kind. Modern mechanical activity has shown itself not in the invention of new machines so much as in the application of new prime movers. The tendency of the time is to replace the prime movers of the early ages by others involving less human waste. The classic trireme was to all intents and purposes a ship propelled by a compound engine, whose cranks were human elbows, and whose pistons were human arms. A rower would not miss his stroke more frequently than the needle of a sewing-machine misses a stitch. But the comparative costliness of men as prime movers has been amply demonstrated by the calculation that, to do the same number of units of work as that produced by the motor of a Cunarder no fewer than a quarter of a million rowers would be required.

But enough has been said in these brief notes to show that, before the age of Iron, men had made considerable progress in mechanical invention, and it needed only the introduction of that metal to enable them to carry out the principles already known to gigantic issues.

THE BURDEN OF ISABEL.*

CHAPTER XXXVIII.—IN THE 'CORNER.'

THE interval till Monday, Suffield spent in peace. He did not think it was worth his while to waste his strength in travelling to London and back in that brief time, even to have the pleasure of seeing and taking counsel with his wife. On Sunday he went to church, and then in and out among his own people, cheering the young, and gossiping with and comforting the aged: he understood his own folk and their rudely affectionate ways better than he did those of the south country.

On Monday his anxiety and trouble began, which were to last till the month ended. He was the simple-minded, honest kind of man—as I have elsewhere remarked—who, when once he suspects, entertains an uncompromising distrust. He disliked and suspected Gorgonio, and therefore he believed it was impossible for Gorgonio, of his own motion, to deal honestly in any business. When he found, on visiting the Indian cotton in dock, that Gorgonio had spoken truth when he had said it was worth no more than twopence a pound, he merely thought it was one of those cases which frequently occur, when the habitual liar has not told a lie only because it was not

worth his while, and he distrusted Gorgonio the more for his having told the truth on one occasion. When Gorgonio asked what should be done with the cotton?—should it be warehoused and sold by parcels?—Suffield suspected him of some ulterior purpose—he would have found it difficult to say what—in making the suggestion.

'No,' said he. 'Sell the rubbish off at once. It's worth no more than twopence; and if we can get twopence for it, let us be thankful.'

But they did not get twopence for it. Twopence was very cheerfully given at first; but when still more was offered and more pressed upon the market 'without reserve,' buyers—a suspicious folk—began to think the cotton must really be worse than the samples indicated; so they refused to give twopence; and before the lot was cleared out a penny was reached. And Gorgonio laughed to himself—for he had secretly bought in a considerable quantity of it at a penny—and exclaimed: 'This is beautiful way to do business! The Suffiel' père is old fool!'

But Suffield was no fool: he was only consumed by dislike of the whole business, and distrust of Gorgonio. It worried and wore him beyond measure that the 'unloading' of 'corner' responsibilities must be entrusted to Gorgonio. It chafed him so much when he sat in his office that he had to get up and take the train to Liverpool 'to see how the Asiatic scamp was getting on.' He would even hang about among the busy crowd on the Liverpool flags—a very notable and half-forlorn-seeming figure—with a kind of watchful eye on Gorgonio; and in the troubled watches of the night he dreamed horribly of Gorgonio—who more and more looked as if he had been buried in some noisome place and, after some time, had been dug up again—of his hideous, pendulous, pitted nose, and his active pig's eyes.

And Gorgonio felt he was disliked and distrusted, and saw he was under such surveillance as the simple Suffield could bring to bear. Under no circumstances was Gorgonio a sweet-tempered and forgiving creature; but under these he became vindictive and reckless—reckless of his backer's interests, and reckless even in a measure of his own. By the following Monday, when prices were 'struck' for the week, not more than twenty thousand of the two hundred thousand bales of contracts had been got rid of; and prices had gone down, so that difference would have to be paid on one hundred and eighty thousand bales! On Tuesday afternoon, Gorgonio came to Suffield and set before him, with an ill-disguised satisfaction, the reckoning which would have to be met on Thursday, the 'settling day.' Mr Suffiel must make out a cheque to be paid into the cotton bank—for a considerable number of thousands!

'This must come to an end!' said Suffield, when he had made out the cheque. 'This repeated much would ruin any man!'

'How can any man make it end, Mr Suffiel?' said Gorgonio. 'The more you sell out, the more will the prices go down!—down! It cannot help itself!'

So the days passed, and George did not return; and with waiting and worry his father began to look worn and aged: his hair turned grayer, and his cheek lost its wholesome ruddiness. It added immensely to his trouble that, under George's

* Copyright reserved in the United States of America.

rule, the interests of the Suffield business had been sacrificed to the demands of this extraneous speculation, and that proper business payments had been half-met or postponed, to permit of money being diverted to cotton transactions.

It was impossible that the change passing upon Suffield and the load of anxiety he bore—he was of those to whom concealment was well-nigh impossible—should not be observed in so well known and remarkable a figure as his. Speculation as to reasons became common. Where was his son?—shipped off because he had run the rig pretty freely? And why did he so frequently journey to Liverpool?—and appear—as was said—on ‘the Flags?’ Men discussed these points as they saw him on ‘Change, as they sat at lunch over against him, and when he passed them in the streets. Whispers went round, and doubts began to gather: Was the house of Suffield becoming shaky? Was he there to stave off reverses brought upon the house by the ignorance and carelessness of his son? A foolish thing that was he had done, in putting his son in complete charge of the business, and going off himself to London, to swell about—oh yes! everybody knew his wife was an ambitious woman!—among London nobles in Parliament and Society! Suffield was a ‘very good sort;’ but he would come to grief yet, through his good-nature and his wife’s ambition!—Suffield saw these things in the looks and heard them in the tones of men, and understood only too well how they might help to bring a more untoward end about. And yet he could do nothing but wait and endure till the end came, putting his shaky trust in ‘that rascal Gorgonio.’

A diversion came at the end of the week. Telegrams were published in all the newspapers—in the Liverpool papers in large type—proclaiming that there had been a great fire on the quays of Savannah, in which some warehouses filled with cotton ready for shipment had been completely destroyed. The extent of the loss was not known, but the immediate result in Liverpool was the raising of the prices of cotton. Thereupon he wrote at once to Gorgonio: ‘Seize this favourable opportunity to sell out as much as ever you can;’ and then he was ashamed that he should be pleased to take advantage of a disaster which perhaps meant ruin to some.

Early next week—which was the third of the crisis—he was surprised and troubled by an anonymous letter from Liverpool. It was signed ‘One who knows,’ and it advised Mr Suffield to put no trust in Gorgonio, who was playing him false: he was working ‘both on the bull and on the bear tack;’ it was to his interest to sell little at present, and then to send down prices with a rush at the end of the month, in the endeavour to clear out. That troubled Suffield very much; for must it not have been written by some one in Gorgonio’s confidence or in Gorgonio’s office? Who else should know that Suffield had such dealings with Gorgonio? Suffield went to Liverpool to see Gorgonio, and found that part at least of the anonymous communication was true; for Gorgonio had sold comparatively little, in spite of Suffield’s urgent instruction after the news of the fire in Savannah. Then Suffield was very wroth.

‘You are not keeping faith with me, Mr

Gorgonio,’ said he. ‘I agreed to carry out my son’s compact about money, and you on that understanding agreed on your part to work off these responsibilities as quickly as possible!’

‘And, Mr Suffiel, I do work them off as quickly as possible.’

‘What, you villain!’ exclaimed Suffield. ‘And this last time, with everything in your favour, you have sold something less than ten thousand, notwithstanding my express instructions to get rid of as many as possible!’

‘What would you have, Mr Suffiel?’ cried Gorgonio, with a snarling reasonableness. ‘First you say, “Do not sell at low price!” Then you say, “Sell so many as possible!” But if I sell many as possible, I must sell at low price, because price go down under great many. Well, what? Which? I cannot please you both way! I am not two person—twice—double! I am not what you call ambidextrous! I am not amphibious! I am not hermaphrodites! No!—Try to sell both way yourself, Mr Suffiel! I am willing!’

What, then, could Suffield say or do? What could he do but fume within himself, and fret, because he was certain this man was playing him false, though he could not refute his plausible arguments? And the worst of it was—the most galling and intolerable thing!—that he must still continue tied to this man till the end of the business.

It was at that time it first became evident to Suffield that the business world in which he lived and moved was aware of his cotton entanglements. As matter of fact, the shrewd Lancashire men, whose care it was to be ‘up to’ all the moves of the complex commercial game, had for some time truly guessed what was the nature of the unworthy connection of the Suffield house with a man like Gorgonio. The disappearance, moreover, of Tanderjee—who, it was known, had had business relations with the younger Suffield—and of Daniel Trichinopoly—who had been his creature—and then of George himself, could not, and did not, fail to be remarked and interpreted. In one way and another, a tolerably accurate knowledge of the situation was common property; inasmuch that, while the older and more staid men refused to believe that a man of Suffield’s commercial probity and honour would encourage so speculative and disreputable a thing as a corner, many of the younger and more light-minded—who knew not Suffield—believed he was still trying to hold the corner for his absent son, and betted on ‘the old man’s’ power to hold out.

Under these disquieting circumstances, it is not surprising that creditors of the house of Suffield—men who commonly would have never thought of pressing for payment—urged their accounts upon the attention of Mr Suffield, who bravely met their demands and wrote them cheques, till his account at the bank began to run to fewer figures than it had been wont. And still he sought assistance or advice of no one, but sat alone in his sturdy and cheery stoicism. One morning—and this was the first event that absolutely convinced him his world was in possession of his secret—‘Mr Poynting’ was announced. Mr Poynting was the head of a firm of engineers who had for many years made all the Suffield machinery, and to whom a large

bill had fallen due. Had Mr Poynting called about that bill?—The heart of Mr Suffield sank.

'Don't be frightened of me, Suffield,' said Mr Poynting. 'I'm not intruding on you as a creditor; I'm come to see you as an old friend. To come to the point at once—you'll forgive me if I'm wrong—you are, or may be soon, pressed for money. Will ten thousand pounds for a year, or a couple of years, be of any use to you? If it will be of any use, you can have it, and welcome, my friend.'

Suffield was so moved by that generous and spontaneous offer of aid that he could not speak for a moment.

'Thou'rt good, Poynting!' said he. 'Very good! I thank tha heartily, but I mun fend for mysen! Had it been a disaster o' Providence that brought me to this I mowt ha' said different, but I ha' brought it on mysen, and I mun wrastle through it by mysen; thank yo' all th' same, Poynting.'

'I ha' understood,' said Mr Poynting, 'that it was your son backed up this attempt at a corner, unbeknown to you.'

'Oh, they say that, do they?—My poor lad! There's not many to say a good word for him now, I daresay; though I reckon they were all "Hail-fellow" wi' him when he was about.—Yes; th' foolish lad thought he was going to do a great stroke. "He that maketh haste to be rich,"' he continued, exercising his agreeable faculty for incorrect quotation, "'falleth into speculation and a snare!" Th' owd way's best! I don't hold wi' these new-fangled dodges for making money. There's no real work or wealth in them. But th' lad's away trying hard to clear off a bit of his mistake, and I'm bound to see him out of it—though it's a more serious job than I thought it would be.'

'I don't hold wi' speculation myself,' said Mr Poynting, 'and corners in anything are, I think, execrable.—But isn't it a pity, Suffield, to let all this cotton go, as they tell me it's going, at poor rates? Take the ten thousand, if it's any help to you, and hold on to the last day for a rise; and then you'll be out of it with a pound or two in your pocket.'

'Thank yo' again, Poynting; but th' cotton mun go. And I'd far rather I lost than other folk. I'll not ha' it said about me that I made a penny out of so detestable a thing as a corner! My only concern now is to save th' business; and I think I can save it—though I may ha' to go and live in a cottage again.'

'Well, Suffield,' said Poynting with resignation, 'you know th' saying: "There's nought so queer as folk." A wilful man mun ha' his way. But if you should think better o't, let me know.'

'Thank yo' again, friend,' said Suffield. 'I'll not forget; I'll remember it a' my days! And he wrung his friend's hand as he went away.'

A little later he was surprised by a visit from a bank official. The official desired to communicate a very delicate and peculiar matter of business. 'You may know or remember,' said he, 'that we were asked by Mr Suffield, junior, to trace fourteen Bank of England notes for five hundred pounds.'

'I remember,' said Suffield. 'You telegraphed to my son in London about twelve of them.'

'We have now,' said the official, 'traced another—traced it to a person in Liverpool named Gorgonio, with whom, I believe, you have dealings, Mr Suffield, and who certainly had dealings with Mr Suffield, junior, and the original holder of the note.'

'You mean Tanderjee?—I was convinced that Gorgonio was a scoundrel!'

'Precisely. Of course, that person may have received it from Tanderjee in the ordinary way of business, or he may not. It would be difficult, we think, Mr Suffield, to show that he did not; but we thought you would like to know the fact.'

Yes; Mr Suffield saw it would be difficult to show there was anything improper in Gorgonio's possession of a five hundred pound note which had passed from the hand of Tanderjee.

'I hope, Mr Suffield,' said the official, 'that this cotton business of Mr Suffield, junior, goes well now?'

'Thank you,' said Suffield; 'but it won't go well till it's gone altogether!'

A PATRIOT'S HOME AND TOMB.

GREAT HAMPDEN—or Hampden Magna, as it is officially termed, to differentiate it from the village of Little Hampden—is situated on high land among the Chiltern Hills. The place possesses at least two distinctive characteristics in addition to its connection with the patriot, John Hampden. There is neither river nor brook to be seen in the parish; and there is no assemblage of houses that can be styled a village, in the generally accepted term of the word. Instead of Great Hampden village, Hampden Row is the designation of the farmsteads and cottages, which are picturesquely scattered along the side of a somewhat large common. The undulating country around Great Hampden is finely wooded, chiefly with beech-trees, which are indigenous to the soil; but there are also many unusually large and beautiful chestnut, cedar, balm-of-Gilead, fir, and lime trees.

Before the time of the patriot, the manor of Hampden had been the property of his forefathers for several centuries. Baldwyne, the owner of the manor in the reign of Edward the Confessor, and Osbert his successor, in the reign of William the Conqueror, are stated to have been ancestors of the Hampden family. The following record is said to be copied from a vellum roll which chronicles the pedigree and alliances of the Hampdens, and bears the date of 1579: 'The manor of Hampden hath contynued in the possession of one race of gentlemen by the space of more than six hundred years, who takyne their name of the place whereof they were Lordes, grew thereupon to be called by the second name of Hampden.' This triple-centuried archive also narrates that, when Osbert was Lord, William the Conqueror gave the manor to one of his followers named William Fitz-Ansculf; but Osbert, 'whether it were by monney or some other means of friendship, so purchased the good-will of the said William Fitz-Ansculf that he suffered the said Osbert to contynue in quiet possession of his

said Lordshippe of Hampden.' It is considered that the village of Hampden, written thus, H—den, is mentioned in Doomsday Book. Baldwin de Hampden, the son of the above-mentioned Osbert, is recorded to have held the manor in the reign of Henry I.

The present residence of the Hampdens is believed to occupy partly the site of the ancient mansion; portions of which, discovered when the building was modernised in the middle of the last century, are said undoubtedly to have dated from the reign of King John. There is a tradition that this monarch visited Hampden House, and one of the apartments, in the north-west front, is still known as King John's Room.

Queen Elizabeth, during her many progresses through her dominions, seems to have left few country-houses of note unvisited. Hampden House is no exception to the rule. Her Majesty's sojourn there is twice commemorated. The bedstead is shown in which she slept; and an avenue called the Queen's Gap, we are told, was cut through the surrounding woods by her entertainer, Griffith Hampden, that his exalted guest might approach his abode by a new and impressive route. This glade, nearly a mile in length, leads in a direct line to the house, from which, through the vista, a beautiful view is seen of the open country beyond.

Hampden House is not wanting in distinction and dignity. It is embattled; a handsome centre and two wings compose the north-west front; and the south-west front is surmounted with a square tower. The building is, however, much spoilt by its having been covered with stucco. The interior is less imposing than the outside leads one to anticipate, the rooms being comparatively restricted in size. Two portraits of the patriot are pointed out amongst the pictures, but their originality seems doubtful. A full-length portrait of Oliver Cromwell, with a page tying his sash, appears better authenticated. The Protector, it will be remembered, was John Hampden's first-cousin, their mothers having been sisters.

Southward of the Queen's Gap, in the woods between Hampden and Missenden, is a place called Prestwood. This is stated to be the identical spot upon which the ship-money tax was levied which Hampden refused to pay, and for which he was tried—the trial in fact bringing about in the end the great civil war.

Great Hampden Church, the burial-place of the patriot, is dedicated to St Mary Magdalene. It is an ancient structure of flint and stone, disfigured, like the house, by a covering of stucco. It consists of a chancel, nave, and aisles. Authorities say that various styles of architecture prevail. They tell us that the nave arcades belong to the Decorated period; the chancel and the upper portion of the small embattled tower to the Perpendicular; whilst the lower portion of the tower is Early English. The church contains some interesting relics of medievalism. An age-worn stoup for holy-water arrests the attention in the large, stone-seated, south porch; on either side of the chancel arch there is a hagioscope; and a piscina is in a well-preserved condition. In most restored churches of pre-Reformation date we see the piscina in the chancel, and often also in the transepts, where side-chapels were once

located. The piscina is a small recess in the walls, furnished with a drain, reaching to the foundations, down which the sacred rinsings of the eucharistic chalice were poured. Hagioscopes, however, are seemingly rarer records of Roman Catholic England. It may not, therefore, even in these days of wide-spread general knowledge, be an altogether familiar fact that a hagioscope is an oblique opening in the interior walls of a church, through which the high-altar was visible to the worshippers in the side-aisles.

The last resting-places of many of the Hampden race are marked by brasses on the chancel floor, the oldest of which dates from 1496. The brass covering the grave of Griffith Hampden, the host of Queen Elizabeth, occupies a central position before the altar. Later members of the Hampden family are memorialised by mural tablets. The only noticeable one, upon the left wall of the chancel, commemorates both the illustrious patriot and his last descendant in the male line. The inscription upon the monument is as follows: 'John Hampden, xxiiii hereditary Lord of Great Hampden, and Burgess for Wendenover in three Parliaments. Dyed unmarried February 4, MDCCLIX, aged 58. Having bequeathed his estate and name to his kinsman, the Hon. Robert Trevor (now Hampden), son of the Right Hon. Thomas Lord Trevor, son of the Right Hon. Sir John Trevor by Ruth, daughter of John Hampden, slain in Chalgrove Field, MDCXLIII. Robert Hampden dedicated this Monument, with all due veneration, to his Great-grandfather, and to his Benefactor's memory.'

Above the inscription there is a bas-relief carved in marble. It represents, in the foreground, the mortally wounded patriot falling from his horse; and, in the background, the church and village of Chalgrove. The Hampdens' armorial bearings are emblazoned on shields, suspended from the branches of a tree that over-spreads the scene.

It is surprising to find that this family of ancient lineage have never had a private vault for interments. However, such is the case. Apparently, the graves of the Hampden family are mostly beneath the pavement in various parts of the church; but evidently some are also in the churchyard, where 'the rude forefathers of the hamlet sleep.'

The register testifies that the patriot was buried—we may be sure with many tears—among his ancestors, in their parish church, June 25, 1643, the day that followed his death. The spot of his burial is not indicated. A search for his remains was organised, in July 1828, by the desire of Lord Nugent, his biographer. An account of the proceedings appeared in the newspapers of the day. The narratives stated that the investigators examined, without any satisfactory results, the initials and dates of several leaden coffins buried beneath the flooring of the church. But at length they came upon a coffin which, judging from its position, they presumed ended their task. It was considered probable that the patriot would desire to be interred near his beloved wife, and the coffin in question was lying nearly underneath the tablet that he erected to her memory, and whereupon he affectionately recorded her numerous virtues.

Notwithstanding that the coffin-plate was too

corroded and broken to allow of the inscription being deciphered, it was resolved that the lid should be cut open. It was hoped that the condition of the body would serve to throw light upon the contradictory statements regarding the manner in which the patriot was wounded, supposing that these were his remains. The gunshot wound, that ended in death after six days of intense suffering, is said to have happened in two very different ways. According to one account, John Hampden's hand was blown off by the bursting of his own pistol, which was overcharged. This weapon, it is narrated, had been given to the patriot by his son-in-law, Sir Robert Pye. Another account says that a brace of bullets shattered the patriot's shoulder. Entire evidence of the former, and partial evidence of the latter, catastrophe are averred to have been detected in the exhumed body. The hand of the right arm appeared to have been amputated, for the hand, or rather a number of small bones, was found enclosed in a separate cloth; also the left shoulder seemed displaced, though, the bones being quite perfect, there could have been no wound likely to prove fatal. The searchers concluded that this dislocation was either caused by the force of a bullet, or by the fall from his horse, after the exploded pistol had done its deadly work.

A general opinion prevailed that John Hampden's grave had been found. But the wish, we know, is often father to the thought. Anyway, it is significant that particulars of this disinterment are omitted in Lord Nugent's life of the patriot. We may therefore infer that the precise spot where Hampden sleeps his last sleep has not been indisputably discovered.

THE CAMERA-OBSCURA.

A STORY.

By J. S. FLETCHER.

IN TWO CHAPTERS.—CHAP. I.

WHEN I first joined the Coastguard service, there was a great deal more romance about it than there is nowadays. A cargo of contraband stuff came in once a week then, where it does not come in once a year now. The smugglers, too, were fellows who were not afraid of giving and taking a few blows in the exercise of their trade. Many a brush have I had with them in which blood was spilt as freely as water, firearms and cutlasses being used on both sides without compunction. It was stiff work in those days; and the coastguard of to-day who walks along his mile or two of outlook and takes occasional sightings with his glass, has small conception of what wild jobs we sometimes had in the old days when a boatful of goods came in from Holland or France to be discharged in some lonely spot on the coast.

However upright and honest in other things they might be, I always found that the coast-people had not the slightest misgivings of conscience where smuggling was concerned. It seemed as natural to them to get their spirits and tobacco free of duty as it is to an ordinary man to buy them in the usual way. I have known men who

would not have defrauded their neighbours of a penny, and whose morality and honesty were beyond question, but who were beyond repentance in the matter of smuggling. The fact was they had been taught to smuggle from their very childhood, and could not see the harm of it. Again, as many of them urged, they bought the stuff over in foreign towns and paid for it—why, then, should they not be allowed to bring it to their own homes? It was useless to attempt any explanation of the law. Dwellers in solitary places know and care little about any laws but their own.

My first station was at Porthlock, a solitary fishing village on the east side of Lizard Point. The population was a typical Cornish one, and there was scarcely a soul that was not engaged in some sea-trade or in some calling connected with the staple industry. Perhaps the parson and the doctor were the only persons not actually concerned in one or other of the boats that put out of the little quay-pool, and I am not quite sure that the doctor was not as much interested in some of them as in his practice, which was not a good one, for the place was wonderfully healthy.

I had not been long at Porthlock, however, when I came to the conclusion that if fishing was the ostensible principal pursuit of the place, in reality it was nothing of the sort. True, the boats went out religiously, and there were great hauls brought to the quay-side; but something lay behind all that. The people of Porthlock, from the old mariner of a hundred years to the sturdy urchins of eight or ten, were inveterate and determined smugglers. I could make no distinction amongst them: the doctor was as bad as any of the others, and I always had an idea that the easy-going old parson was not beyond accepting an occasional gift of brandy and tobacco that had never paid duty.

It was impossible to feel angry with these people, for they performed their nefarious practices under my very nose, and smiled in my face as they did so, just like naughty children that laugh at you when they are committing some piece of perversity. They were always friendly with me, and if I had but said the word, would have found me in as much spirits and tobacco as would have supplied me for a twelvemonth. My predecessor had been somewhat lax in his duties, and I had a pretty strong suspicion that the Porthlock folk had bribed him to willing blindness whenever his eyes ought to have been extra sharp. They soon found, however, that I was not going to aid and abet them in defrauding Her Majesty's revenue. I had come there to do my duty, and meant to do it at whatever cost.

I said as much to the doctor, a red-bearded, broad-figured Scotchman, who had seen everything and been everywhere, and who was the most genial, easy-tempered man I ever knew. He never seemed to have anything to do, save when a wee Porthlockian came into the world, or some old inhabitant went out of it, fairly worn out and venerable in years. He was a mighty man at fishing and otter-hunting, and could tell the finest stories over his glass of grog and pipe of bird's-eye. Again, he was friends with everybody, treating the fishermen as brothers, and not un seldom going out with them to sea. He was also as brave as a

lion, and was always first to respond if the life-boat was summoned.

'Why, of course,' said he, 'there's smuggling going on in the place. The drap spirits ye're drinking, man, never paid duty, nor yet the baccy in yer pipe.'

'That's a nice thing to tell a preventive officer, doctor,' I answered.

'Hoot, toot, man: dinna fash yersel' on that score. What harm will the puir bodies do to the Queen by bringing a bit cargo o' stuff across the water?'

That was how they all looked at it. They could see no harm in smuggling. It was a proper adjunct to their other trade of fishing.

There was one family in the place, however, who unblushingly proclaimed the fact that they were smugglers and nothing else. True, they did not say so in plain language; but their actions were just as eloquent as any words could be. They possessed two fine boats, and went to sea; but they never brought any fish back to the quay-pool. Sometimes they stole out of the harbour at night, and were away for a day or two. When I next caught sight of them, they were pursuing their usual vocation of lounging about the quay-pool; but there was an air of satisfaction on their dark visages which could only be accounted for in one way—they had successfully run in a cargo of contraband goods.

The name of this family was Nanjulian, and there were nine males engaged in smuggling—the father, old Zebedee Nanjulian, and his eight sons. Tall, athletic, dark-visaged men they were, all well able to show more than ordinary strength at wrestling and fighting. One of their peculiarities was a devout love of Scripture names. The eldest son was called Aaron; the second, Matthew; the third, Titus; then came in order Timothy, Cleophas, Simon, Esau, and Pharaoh. The last named was the one whom I cared less about than any of his brothers. He was about twenty-five years of age, and had an expression of countenance which I did not like. Pharaoh Nanjulian, in fact, looked the sort of man to stick at nothing. I felt sure that in a fight he would kill an enemy without compunction, and I devoutly hoped that he and I might never get across each other in the course of events.

As matters turned out, this was precisely what we did do. Not more than two miles out of Porthlock, right on the edge of the cliff, there stands a gentleman's seat, the name of which I have forgotten. He was a scientific man, who had built himself an observatory, and was always taking observations and such things about the sky and sea. I have forgotten his name too. But I have not forgotten the pretty little lodge which stood at the entrance to his grounds, nor the old lodge-keeper's pretty daughter, Bertha Penruddock. Old Penruddock had been a coast-guard man himself long years before. He was very comfortably housed in the lodge, and his duties were light enough, for there were days and days together when the gates were never opened.

My lookout extended just as far as Penruddock's place, and many a cold winter night did I step inside the cheery little cottage to warm myself at the fire. Very soon I began to feel something more than a passing interest in Bertha.

She was a pretty girl and a good girl, and would make any man a true wife. When I had come to that conclusion, I used to go to the lodge oftener than ever.

But Bertha had another suitor in the field—dark-faced Pharaoh Nanjulian. He was a strange suitor, too, never striving particularly to have speech of the girl, but always hanging about the lodge, as though he fancied that she would fall in his way sooner or later. Now and then, old Penruddock had asked him what he meant by loafing around there; and received a surly answer that the cliff was free to anybody, which was true enough. Once or twice Bertha, coming home from Porthlock, was met by Pharaoh and forced to speak to him. As he always behaved himself, and was certainly no stranger to the Penruddocks, the girl could hardly tell him that she wanted none of his company. He never made any advances to her, his sole method of making love being to stare at her pretty face and utter occasional remarks about the weather.

Master Pharaoh, however, was not minded to have a rival. He had set his heart upon marrying pretty Bertha. When he found that I was visiting the lodge-keeper rather oftener than mere friendliness called for, he waylaid me, and told me his mind straight out like a man. He was coming along the cliffs when I met him, and planted himself in my path—a tall, dark-faced young giant.

'Aw—ax your pardon; but you're a-trespassin' like on my presarves, Master Walsh.'

'Trespassing on your presarves. What do you mean?'

'Aw—ax your pardon if I be wrong; but heard you was going a main deal to Penruddock's cottage. Make so bold as to tell ye what I hear.'

'You've heard right,' I said. 'But what then? How I am trespassing on your presarves because I go to Penruddock's, I don't see.'

'Aw—well, I do mean to marry Bertha Penruddock myself, iss, sure I do; and won't have no man a-courtin' of her.'

'The young lady will please herself, I suppose,' I answered, feeling rather out of temper at this summary method of warning me off. 'I shan't stop away from Penruddock's because you tell me to do so.'

'Aw—then 'twill be unpleasant for ye, Master Walsh. Ax your pardon for tellin' ye; but 'tis terrible fuleish work to go again me.'

I said no more, but went forward and left him. That night I went to Penruddock's cottage again and told them what Pharaoh had said. Somehow or other, Bertha and I came to an understanding on that occasion, and I went homeward with ample assurance that however much Pharaoh might object, she would in due time become Mrs Edward Walsh.

Winter came on, and I soon formed a decided opinion that the Nanjulians were engaged in very extensive smuggling. From various bits of evidence that came to hand, we had no doubt whatever that valuable cargoes were being landed close to Porthlock, and so cleverly that we could not trace them. I nearly wore myself to death in keeping a lookout, and yet I came across no clue. It was a trying time, for I was on my merits, and a clever capture would have earned

for me the promotion I wanted. I grew anxious and careworn, and my peace of mind was not increased by the fact that the Nanjulians passed me with a sort of laugh-in-the-sleeve expression on their brown faces.

I came to the conclusion at last that somewhere along the neighbouring coast there was a cleverly concealed hiding-place where the smugglers were storing their goods. I would have given a year's wages to have found it. I hunted the rocks along the coast, and examined the rough ground on the headlands above, and could find nothing. Once, when I had been out all day engaged in this manner, I met several of the Nanjulians on my return, and heard them laughing in a sneering way after they had passed me. No doubt they had watched my proceedings, and were delighted to think that I was completely outwitted. But I felt sure that sooner or later the tables would be turned on old Zebedee Nanjulian and his eight sons.

One fine winter morning I found myself on the cliffs near Penruddock's cottage, and turned in there for a few minutes' chat with Bertha. The old man was out, and Bertha stood at the door with a pail of hot water and a scrubbing-brush in her hand. She had just locked the door and put the key in her pocket.

'Whither away, my girl?' I said.

'I'm going up to the Squire's latest invention, Ned,' she answered. 'He's built a thing on the Point yonder that enables you to see over the country all round. A camera-something they call it.'

'A camera-obscura,' I said. 'Ay? I should like to see that, Bertha. Is any one about?'

'The Squire's gone away for a day or two,' she answered. 'Come along, Ned. I know how to work it. You pull two or three strings, and walk round a white table—that's all. I'm going up there to scrub the floor.'

The Point, where the little wooden house for the camera-obscura had been built, was a high bit of wooded ground on the edge of a little promontory that ran out seawards, and fell sharply away to the sands. There was a good view of land and sea from it, and no better spot could have been found for the Squire's purpose. That morning was exceedingly bright and fine, and the view we had of the surrounding country was very clear. I soon learned how to manipulate the cords, and we spent a very pleasant half-hour watching the familiar objects appear on the white table. There was the town of Porthlock with its quay-pool and old-fashioned gables; then the beach and sea; then another stretch of beach and rocks; then more headland and coast; and again the lonely meadows until we came round to Porthlock once more. It was most amusing to have far-away objects brought so near home. Just as we had completed the circle, we heard old Penruddock calling Bertha's name in the grounds outside.

'He wants the key,' said Bertha; and opened the door and ran away towards the cottage. I shut the door again, and pulled the cords so that the beach beyond Porthlock was photographed on the table. It had struck me that a camera-obscura would save me many miles of walking in fine weather, for it brought all the country close to your very eyes. I pulled the reflector

round, not having any particular object in view, until a bit of coast about a mile away lay represented on the table. The scenery just there was very wild and rugged. It was known locally as the Six Sisters, because there were six obelisk-like rocks there which rose straight out of the water and the sand, four of them being below, and two a good deal above high-water mark. These rocks, with their sharp points, were very accurately represented by the camera-obscura; and I was admiring the cleverness of the invention, when I suddenly saw something which brought an exclamation of wonder to my lips.

Down the face of the cliff came five men. I recognised them at once as five of the Nanjulians. No other men in Porthlock had such tall figures or long limbs. Which five I could not say, for I could not distinguish their faces, but five Nanjulians they were. When I saw that, I slipped a catch in the door, so that no one could open it and let in the light. Then I followed the movements of the far-away group with eager eyes. It was like watching ghosts moving in a land of shadows. The five moved about aimlessly for a while, but I noticed that each wandered in a different direction. Presently they drew near each other again, and were joined by a sixth Nanjulian, who came down from the headland. Then they all went to the base of the sixth rock—the one that stood highest out of high-water mark. I could not make out what they were doing, but presently I saw them one by one disappear into the sand, as if they had been swallowed up. The sixth remained, and was busied about the base of the rock for a little while, after which he walked away along the sands in the direction of Porthlock.

I went out with a feeling of triumph. I had found the key to my puzzle: I had, by a strange chance, discovered the store-place of the Nanjulians' contraband goods. At the base of that rock there was a trap-door, covered by the sand, and affording entrance to one of those subterranean caverns where goods or men can be concealed with perfect safety. The man who remained above had done so in order to spread the sand over the trap-door again: those who had gone below were doubtless engaged in packing or arranging the fruits of their last smuggling expedition. Such was the theory I formed. I had no doubt of its being correct; it seemed to me that the time was ripe for making a splendid capture.

LINGERING AUTUMN.

THE morning mists begin to gather in the moist low-lying meadows, and linger amongst the hills and woods far into the day. The richness of colour in the forest trees, the yellowing patches in the hedgerows, and the russet-brown and gold of the ferns and bracken, show unmistakable signs that the late beauty of Autumn is with us. The amber light of the sun no longer shines on the harvest fields, for the ripened grain has been long gathered and garnered, save here and there a late crop of beans or aftermath. The drooping poppies have lost their brilliancy of colour; yarrow and hawkweeds have taken the place of scabious and toad-flax, oxeye daisies and harebells; but

the hardy pink-and-white convolvulus is still in blossom amongst the matted weeds and stubble, though the flowers are more delicate in colour; and the fragile leaflets and pinkish purple bush-vetch adds to the fading beauty of autumn.

Along the banks are bunches of white campion, their pure flowers standing fair and tall from the wild tangle of grasses and wild-oats; and growing in close proximity in the moister ditches is its sister-flower, the red campion. Sometimes that erratic wanderer, the spikenard, is found in the hedges at this season; and on the waste lands and wayside are seen marsh-mallow and yellow lady's-slipper. On sunny afternoons the humble-bees are still busy on the wild thyme and gorse bushes. Tall plants of thistles and burdock add their handsome clusters of foliage and purple heads to the scene.

The fullness of autumn is shown in the trees and hedgerows, that abound with hips and haws, sloes, blackberries, and other wild-fruit; and if there be any truth in old saws, it foretells a sharp winter; but with wild-fruits as well as cultivated sorts the cropping is more often determined by the state of the weather during the time of blossoming and setting.

There are stores of nuts and acorns, there are wild plums in abundance; and on the boughs of the old crab-trees, besides the fruit, are dainty gray-green lichens, and brownish green mosses on the gnarled old stumps. The woolly night-shade climbs and clings and straggles about the hedges; and even at this late season, some lilac blossoms are on the long trails, with the bunches of berries varying in tint from green to pale yellow, orange, red, and finally deepest crimson. Not far off is its near relative, the common night-shade, whose berries are jet black.

The bearberry was once thought poisonous in England, but is now better known, and much appreciated, making an excellent conserve. It is so used in Spain and Ireland. It was first brought to this country by the monks of Mucross Abbey. The dells and hollows under the young trees in the coppices are beginning to fill with a rich carpet of fallen leaves, though they have fallen so quietly, so gradually, we have hardly been conscious of their decay. The closing year has been a most exceptionally fine one throughout the length and breadth of the British Isles: the first months were comparatively mild, and free from sharp frost; then came the calm bright sunny spring, followed by the brilliant hot summer; and the warm welcome rains of July caused a fresh up-springing of herbage; and now the late autumn is sinking into the arms of winter with a quiet loveliness almost unprecedented. The broad harvest moon has waxed and waned in crimson splendour, succeeded by the lingering twilight and soft cool darkness of early autumn, and the wind sighs fitfully through the leaves with a gentle mournfulness.

Autumn departs, but still his mantle's fold
Rests on the groves of noble Somerville,
Beneath a shroud of russet dropped with gold;
Tweed and its tributaries mingle still;
Hoarser the wind, and deeper swells the rill;
Yet lingering notes of sylvan music swell
The deep-toned cushat and the redbreast shrill;
And yet, some tints of summer's splendour tell
When the broad sun smiles down on Ettrick's
western fell.

As October draws in, the clearer sharpness of the air, the sharply defined clouds, and the rapid shortening of the days, usually show the advance of the season; but the days are often very pleasant, and as a rule there are quite twenty fine days in this month. The few remaining members of the swallow tribe take their departure to sunnier climes, though, occasionally, stray late broods may be seen hovering over the sheltered banks of rivers and streams till the middle of November. The redwings now begin to come in flocks, and pick over the root-crops and pasture-lands in search of grubs and insects, till stress of weather sends them to happier hunting-grounds. Larks and other birds which stay the winter with us also congregate in flocks on the approach of frosty nights; and the touch of winter begins to be perceptibly felt morning and evening. The lingering late leaves will soon be down, and the noble trees, but lately standing clothed in grand masses of colour, will be stripped bare of foliage; and the sighing winds exchanged for louder, rougher tones, that eddy round the hills and woods in wild rushing blasts. The whir and rustle of birds, the crack of the gun, the scuttle and rush of dogs, and the cheery 'View halloo!' of the huntsman, all tell how swiftly the eventful year is speeding to its close. Silently it has slipped away in all its glowing splendour, its soft promise of spring, the rich fulfilment of summer, and ripeness of autumn; and soon the 'old year will lie a-dying' under the glittering eternal stars, with all its loves and hopes, its joys, ambitions, and lost opportunities, to vanish in turn in the abyss of time.

SEA-VOICES.

WHERE the broad sands lay smooth for fairy feet,
And shells of pearl shone in the dim moonlight,
The fisher-lads were courting while the bleat
Of moving flocks came through the peaceful night—
And ever like a plea
Rose the insistent murmur of the sea.

And when the fishers sailed to snare the fins
That ripple all the surface of the deep,
They went a-smiling, for 'he laughs who wins'—
Although the peewits neared in boding sweep,
And to a minor key
Was changed the boding music of the sea.

But when the storm-winds tore the gathering clouds,
And loosed their fury on the watery world,
So that the dead must gibber in their shrouds,
And into space th' unready quick be hurled—
Then ominous and free
Woke the remorseless thunder of the sea.

But when the oil of heaven had calmed the waves,
And noon was ripening over hill and lea—
Over the mourners and the ocean-graves,
Hark to the bitter sobbing of the sea!
For sorrow that must be,
The bitter, bitter grieving of the sea.

A SECRET OF THE SOLOMON ISLANDS.

By J. F. HOGAN, M.P.

A CABLE message from Brisbane published towards the end of July this year announced the proclamation of a British protectorate over the Pacific group known as the Solomon Islands. Thereby hangs a tale, and not the least singular of the many romances of real life that are associated with the early history of Australia. It is the story of one of the most colossal speculators of the nineteenth century, and of his unwitnessed, but, there is every reason to conclude, horrible fate. His name was Benjamin Boyd, and he was born about 1796, the son of Edward Boyd, of Merton Hall, Wigtown, a member of an old Scottish family. He claimed to be a direct descendant of a brother of the Thomas Boyd who was the ancestor of the Earls of Kilmarnock. For some years he carried on business in London as a stockbroker; and in the year 1840, being then in his forty-fourth year, Ben Boyd—to give him his familiar colonial designation—arrived at the antipodes in the capacity of managing director of a new financial institution called the Royal Banking Company of Australia, but which was in reality a syndicate of Scotch and English speculators, who had convinced themselves that huge fortunes for each and all were to be made in a few years by large and judicious investments in Australian land. As a matter of subsequent history, they were perfectly right in their calculations; but the proverbial slip between the cup and the lip came in the collapse of their trusted colonial agent (Mr Boyd) when they were all on the eve of becoming millionaires. Had they been able to hold on to their investments until the gold discoveries had sent up the value of Australian land a hundred, and even a thousand fold, they would have rejoiced in the title of lucky speculators; but the fickle goddess decided against them. They not only lost most of their original capital, but they had the added mortification of seeing others reaping the golden harvests that they had sown.

But I am anticipating the course of events. From the nature and constitution of the Royal Banking Company of Australia—a syndicate of British speculators with no practical knowledge of the colonies, and only anxious to acquire wealth without working for it—it is obvious that Mr Boyd, the managing director, and the man on the spot, could do what he pleased with the subscribed capital of the organisation. There was practically no check whatever upon his operations. Finding himself virtually uncontrolled, and with large financial resources to draw upon, he lost no time in either purchasing or leasing from the State immense areas of land in New South Wales and the districts that have since become the separate colonies of Victoria and Queensland. These he stocked with sheep and cattle; and he thus rapidly blossomed into one of the most enterprising of pioneer 'squatters.' As a further outlet for his superfluous energies, he organised a fleet of whalers, with which he pursued and captured the leviathans of the deep, that were then pretty numerous in the Australian seas, but have since been mostly scared away in the direction of the South Pole.

As a headquarters for his whaling industry, as well as a port of accommodation for his numerous squatting stations in the south of New South Wales, he resolved to build a town on the southern shore of Twofold Bay. In the establishment of this town, which he named after himself, he sank thousands of pounds; and it proved the most disastrous of all his speculations. It involved him in a long and ruinous conflict with the New South Wales Government, who were sensible of the great future importance of Twofold Bay as the one safe and commodious harbour between Sydney and Melbourne. They accordingly proclaimed a Government town on the northern side of the bay, and christened it Eden, which paradisiacal title it bears to this day. The fight for supremacy between these two towns was fierce and vigorous in the extreme. Eden of course was pushed ahead by all the motive-power of Government patronage and State

expenditure ; while Boydtown was built up into prominence and seeming prosperity by the capital of the confiding shareholders of the Royal Banking Company. It was probably to keep these latter in good humour that a most attractive and reassuring picture of Boydtown found its way into an early number of the 'Illustrated London News.' Amongst his other varied accomplishments Mr Boyd must have thoroughly mastered the art and practice of 'booming,' for in a voluminous 'Gazetteer of New South Wales' brought out in 1848 in London and Sydney by the Government Surveyor of the colony, there are actually more than twenty pages devoted to a most eulogistic description of Boydtown ; while the rival Government town of Eden is dismissed in a dozen lines. He must have been a smart man who accomplished that feat. There are besides in the Gazetteer two steel engravings illustrative of Boydtown in the heyday of its brief prosperity, one showing a number of whales being harpooned in the harbour, and the other exhibiting Boydtown as apparently the most solid, substantial, and progressive of budding cities.

Alas for the gorgeous dreams of its enterprising founder ! Boydtown has been defunct for close on forty years, although I am aware that it still retains a ghostly existence on most maps of Australia issued in Great Britain. Geographers, or, to be more specific, map-producers are one of the most conservative races under the sun. Once a town gets upon a map, it has got to stay there apparently, and the fact that it has vanished off the face of the earth is a matter of no consequence. It so happens that I have wandered amongst the ruins of Boydtown, and I can certify in the presence of Messrs Stanford, Keith-Johnston, Bartholomew, and all the other geographers, that they have been unconsciously for many years perpetuating a little fib. Boydtown is now, and has long been, a deserted and almost lifeless collection of magnificent ruins—all that is left to represent many thousands of good British money.

Boydtown is associated with my first experience as a special correspondent. It was soon after I joined the 'Melbourne Argus' that a large steamer called the 'Balclutha' disappeared in a furious gale between Melbourne and Sydney. Government steamers promptly started from each of these capitals—the 'Despatch' from the former, and the 'Captain Cook' from the latter. I was on board the 'Despatch' as the representative of the 'Argus.' We searched all along the coast until we arrived off Twofold Bay, where we fell in with the 'Captain Cook.' Neither had discovered a solitary trace of the missing steamer, nor was any evidence of her fate ever afterwards elicited. Both the 'Despatch' and the 'Captain Cook' steamed up Twofold Bay to Eden, where we all went ashore and telegraphed reports to our principals. We remained off Eden for a day to await further instructions. I availed myself of this opportunity to go round the head of the bay to the ruins of Boydtown, and see all that was to be seen of the vanished glories of the most daring and colossal of colonial speculators. I surveyed the silent walls of the towering, magnificent, but now empty abode that Mr Boyd had built and destined for

himself, where he would reign as *de facto* Governor of all the southern district, and from which he could exercise sway and influence over a country larger than France. I strolled over the monster hotel he had erected for the accommodation of the host of visitors and intending settlers that he fondly anticipated would arrive in regular batches when the name and fame of Boydtown, and the province of which it was the predicted capital, became known all over the English-speaking world. I wandered alone through the grass-grown streets by roofless cottages and past gigantic warehouses and factories that, even in their decay and abandonment, told of the phenomenal, if fleeting, prosperity of the place, and compelled a silent tribute of admiration for the luckless adventurer who could conceive and execute such titanic and far-reaching schemes. I walked along the rotting wharves and jetties, once all life and activity with the loading and discharging of ships, now without a solitary vessel moored to their worm-eaten sides. I climbed up the headland, on the highest point of which there stood the towering white-stone lighthouse that never was a lighthouse, for, after erecting it at an immense cost, Mr Boyd found that the Government had power to prevent him from ever exhibiting a light from its summit. And I came away from all these melancholy survivals of one man's mad ambition, unbridled speculation, and evanescent glory, with the philosophical reflection that, even in a young country like Australia there is abundant material for moralising on the vanity of human wishes.

'But what has all this got to do with the Solomon Islands?' I fancy I hear the reader exclaiming. Well, I am going to establish the connection now. It was necessary to give some account of the comet-like career of this extraordinary character, in order to understand and to appreciate the appalling fate that was so soon to overtake him at the hands of the Solomon Islanders. As time went on, and as the promised dividends failed repeatedly to be forthcoming, the British shareholders naturally became dissatisfied, and at last burst forth into loud murmurs against their local managing director. They demanded some more substantial return for their money than pretty pictures of Boydtown in the 'Illustrated London News,' glowing accounts of the hundreds of thousands of acres they owned, covered with multitudinous flocks and herds, and the fleets of whale-ships they possessed all over the southern seas. Boyd, besides, had 381,000 acres of land, which were his own property. Had the shareholders been patient a little longer, they would really have become, in the language of the Adelphi hero, 'rich beyond the dreams of avarice ;' but by insisting on a change of management, they deprived themselves of all the enormous added value to their properties that the opening-up of the Australian gold-fields conferred, and virtually wrecked the gigantic and far-reaching enterprises that Boyd had built up with their and his money. The upshot of the negotiations was that Boyd agreed to retire and resign all claims on the syndicate in consideration of his receiving three of the whale-ships, his yacht the 'Wanderer,' and two sections of land around Boydtown. On his retirement, the vast Australian properties he had acquired soon fell into the

English Court of Chancery, and were disposed of in London at prices that represented only a fractional part of their value twelve months afterwards. The shareholders had to make good a deficit of £80,000.

Having been thus compulsorily relieved of all cares and responsibilities in connection with the Royal Banking Company of Australia, this mercurial and most sanguine of speculators light-heartedly went on board the 'Wanderer,' and careered across the Pacific on a visit to the newly-discovered gold-fields of California. According to the popular novelist, Rolf Boldrewood, who was acquainted with Boyd and the 'Wanderer,' the latter belonged to the Royal Yacht Squadron, and was a handsome topsail schooner of two hundred and forty tons register, fitted up with great elegance, and well armed. 'She might have passed for the model of one of Tom Cringle's fascinating privateers.' It was on June 3, 1851, that the 'Wanderer' steamed through the Golden Gate of San Francisco on the return voyage to Australia. On October 14 she found herself becalmed off Guadalcanal, one of the Solomon Islands. A book that is now exceedingly rare, 'The Last Cruise of the Wanderer,' thus pictures the scene: 'How can I describe the beauty of the scene now presented to us? The lofty hills crowned with forest cast a deep shadow across the little bay. Canoes were skimming and glancing through the calm water. The wild natives shouted, whether in welcome or otherwise, we could not say. Mr Boyd never appeared in better spirits, walking up and down the deck exclaiming: "Is not this delightful?" Intending to have a day's shooting on the morrow, we had our guns cleaned in readiness for the morning's sport.' Then, under date October 15, the diarist of the cruise continues: 'Having been on watch during the night, I did not rise as early as I intended. On reaching deck I perceived that Mr Boyd had anticipated me, and was half-way between the schooner and the shore. I hailed him. He said he should be on board to breakfast, and bring off some game for dinner. These were the last recorded words ever uttered by him. He was accompanied by Kapartania, a native of Panapa, who sculled the boat. We saw them enter the creek and disappear round a bend of the stream. We heard two shots at intervals of a quarter of an hour, of which at the time we took no notice.' But suddenly a number of canoes filled with evidently hostile savages put off from the shore towards the yacht. What followed is thus described:

'Suddenly a cry arose from the water—a cry, which, once heard, could never be forgotten. It was as if a host of demons had suddenly been let loose. The air resounded with their yells and the sullen roaring of war-conches. A shower of spears and arrows with other missiles came hurtling among us. Sheltering ourselves behind the bulwark till the first storm passed, we fired into the canoes with deadly effect. Many were shot down before they were driven from the after-part of the vessel's side. On they came again, and were rapidly driving our crew aft, their boarding-pikes being opposed by the wicker-work shields with which the natives defended themselves. However, these proved of no avail against the white man's fire. Our crew made a charge and cleared the decks, despatching the

wounded and throwing them overboard. Then we brought a two-pounder swivel gun, loaded with grape, to bear upon the canoes. This decided the battle. Thoughts of poor Boyd crossed my mind often during the conflict. None of us now doubted but that he had been cruelly murdered, the last report of his gun probably preceding his death. The poor lad with him could offer no resistance, as he was unarmed. The defeated savages retreated about a hundred yards, huddled together in the greatest confusion. We ran out our deck guns and opened upon them with grape. We could hear the iron hail crashing through the canoes, when all made instant retreat for the shore. The majority of the canoes, in consequence of our continued fire, were left on the beach, the natives escaping to the woods, carrying their dead and wounded. One native was seen running along the beach with Mr Boyd's hat on.'

For several days in succession the officers and crew of the 'Wanderer' searched all over the island for traces of their unfortunate chief, but all in vain. They discovered nothing but the sword-belt which he had on when he left the vessel on the fatal morning. They found it amidst ominous surroundings—in a stranded canoe filled with water and blood. More than forty years have passed, and during all that time not the slightest scrap of evidence has been forthcoming as to the manner in which this bold, adventurous, and remarkable celebrity vanished beyond mortal ken. But as the Solomon Islanders were then, and to no small extent still are, amongst the most notorious cannibals of the Pacific, it is to be feared that the official placing of the group under the protection of Her Majesty will not appreciably contribute to the solution of the mystery.

By a sad and striking coincidence, the day on which Ben Boyd vanished into the unknown was actually the day preceding the first authoritative publication of the news of the gold discovery in Australia, a discovery that was destined to add immensely to the value of the vast areas he had acquired when he was the Napoleonic managing director of the Royal Banking Company. 'What an ironic stroke of fate,' exclaims Rolf Boldrewood, 'that the doomed "Wanderer" should be on her way to Australia in the month of the year 1851 when her owner would have heard of the wondrous gold discovery by which his vast properties, with his increasing flocks and herds, were quintupled, yea, advanced tenfold in value—that, while on his way to the golden land to hear of marvels worthy to be ranked with the tales of Scheherazade, with Sindbad and the valley of diamonds, he should have gone ashore at a fateful isle in the South Seas to shoot a few pigeons and return for breakfast, and—never to be seen again.'

There is a portrait of Boyd in the British Museum, taken in Sydney in 1848, when he was at the zenith of his Australian pride, power, and magnificence as the largest 'squatter' or pastoral prince in the southern hemisphere. Beyond a general suggestion of shrewdness and solidity, there is nothing strikingly Scotch in the face, which on the whole conveys an impression of kindness, thoughtfulness, and benevolence. The eyes are somewhat keen and penetrating—an

index, no doubt, to the character of the cool, far-seeing speculator. The forehead is high and massive, and the head is crowned with masses of curly hair. Altogether, the features are decidedly pleasing, and even prepossessing.

P O M O N A.*

CHAPTER VIII.

And yet he glanced not up, nor waved his hand,
Nor bid farewell, but sadly rode away.
This was the one discourtesy that he used.

Tennyson.

It was very wet the following morning; the rain came down in torrents, swelling the brook that ran down the side of Scar Street, till it became quite an important-looking stream, and whirled away the cabbage stalks and lobster shells, as if it would not stand any nonsense or stick at trifles.

Nigel had a sore heel, contracted during some of his breakneck climbs on the Landalip; but this did not signify, as jam-making was the order of the day, and for that occupation you can shuffle about comfortably in one of Mrs Rockett's old slippers, and can cross the road when necessary on Dennis's back.

Sage did not mind the rain either; she would have been equally serenely happy if the sun had shone, which would have meant a long morning on the cliff or shore or in a boat on the shining blue sea, always in that company that made sunshine quite independent of the capricious luminary overhead. But as it rained, it would be almost more delightful to spend the time in the studio with the painter working at his canvas, so absorbed sometimes in his work that he was unconscious of the presence of others, who in their turn became unconscious of him, and wandered away into that solitude à deux which is so blissful.

'What are you smiling at?' Kitty asked suddenly, looking up from weighing the blackberries with much-stained fingers.

And Sage flushed up all over her face and delicate neck, for she was smiling at the anticipation of the brisk step that was sure to sound in a few minutes down the street, and the figure that would fill the low doorway, obstructing the light that found its way mainly into the room by the door; and the cheerful, pleasant voice that would convey a peremptory message from the painter to come and cheer his loneliness, as he was bored to death with Maurice's company.

Sage had helped Mrs Rockett to wash up the breakfast things, after which that lady had gone stumping across to the 'Black Dog,' with her skirts tucked up abnormally high, and children and blackberries following close at her heels; so Sage was left alone in the little kitchen with the big eight-day clock in the corner tick-tocking away, an hour and a half slow, and the drip-drip of the rain from the eaves.

Sage got out a little sketch and began touching

it up, not improving it very much, I fancy, for it was only done from the wish to appear occupied when that step should come down the street, so that she might not seem to be listening and expecting with every fibre of her body.

'I say, Sage,' cried Nigel, entering, 'haven't you any more jars or anything we can put the jam in? I wonder if Mrs Stock has a few jars she could lend us? She's awfully good-natured. It's not raining half as bad as it was' (just then a swirl of wind and rain blew in at the door and rattled the casement); 'don't you think you could just go up to the farm and ask? I'd go in a minute, if it wasn't for this jolly old foot; and I don't want Dennis and Will to meddle with my pots; they're a lot better than theirs.'

Sage got up with more alacrity than you would have expected from her listless attitude a minute before. Here was a plausible excuse for going up to the farm, an excuse she had been trying vainly to find for the last hour. A fortnight ago, no excuse would have been needed; but now Nigel's jam pots were hailed as an excellent reason for leaving the picturesque, little kitchen, where the silence had become almost intolerable, and for sallying forth into the stormy, gusty weather, to climb the windy, exposed path to the farm, and find out what had happened to alter the usual course of events in such an unaccountable way.

She reached the farm, all blown about, breathless, and dishevelled. Mrs Stock was shaking a duster at the door, and received her with loud exclamations at her venturing out on such a rough day.

'Come right away into the kitchen; and take off your cloak, and let me see if your petticoats is wet. Why ever didn't one of the chaps step up for the jars?—Bless you, I've a plenty. I'll send Bill down with a basketful on 'em.—And don't they want some apples to put along with the blackberries? It makes it a deal nicer, to my thinking, though I don't care much for it anyhow, with all them seeds getting into your teeth and teasing the very life out of you.—There; I'll just go up to the apple-room and look out a few, as I don't think Mrs Rockett had a-many on them trees of hers, and not good cookers, if she have.'

From the open kitchen door the studio door was plainly to be seen, and Sage felt sure that door would open directly Mrs Stock's very audible voice was heard; but this did not happen; and a little return of the chill of disappointment crept into her heart as she stood by the kitchen fire, while Mrs Stock went off to the apple-room with her mind absorbed in jam-pots and fruit.

The smell of tobacco smoke was reassuring, and with a sudden impulse she plucked up her courage and went across and knocked at the studio door.

'Come in,' sounded the painter's voice; and, with a very fluttering heart, she opened the door and went in.

Owen Ludlow was painting, with his back turned to the door, and an appearance of great application and absorption. There was no one else in the room.

'Is that you, Sage? Come in, my dear. What a miserable wet day for you to come out, child!

I am improving the shining hour—not very shining is it, though?—and am trying to finish off that little bit on the beach with old Lot in his boat.—Come and see what you think of it.’

Sage crossed the room, and stood behind the painter's chair with her eyes fixed on his canvas, but I do not think she could have told what was the subject there portrayed, for, mentally, she was examining the room, which with her bodily eyes she had taken in at a glance, for reassuring signs that Maurice's absence was only temporary, and that in another moment he might be there. It struck her with a little chill that the room looked neater than it had done of late; for Maurice was one of those men who make their presence evident by a newspaper left here, a pipe there, a glove dropped on the ground, and the chairs pushed about anyhow. To be sure, an open book lay face downwards on one of the chairs, and on this her mind fixed while she stood behind the painter, who talked away more volubly than was his wont about his work, a volubility that had a touch of feverishness about it, if Sage had been alive to peculiarities of manner just then.

But at last he stopped rather abruptly, perhaps aware of how little attention his silent auditor was paying to his somewhat pedantic harangue on tone and colour; and he bent more closely to his work on the toe of Lot's boot, as if his life depended on depicting the ravages of time and sea-water on that article; and he said in an artificially careless manner: ‘Moore had to be off sooner than he intended. He went up by the 6.30 this morning. He asked me to say good-bye for him.’

There was a murmur in response that might have meant surprise or regret or interest; and the painter went on with a few remarks on the train-service from Shingle and the advantage of being able to catch the express at the junction; and she answered ‘Yes’ and ‘No,’ not always quite appropriately; and presently she turned away with a little shiver and sat down in the arm-chair where the open book lay.

A fire had been lighted in the studio, as it was damp and chilly; and the painter, who felt that little shiver, and knew that it was mental chill which induced it, pretended to attribute it to her windy, wet walk, and pushed the chair close up in front of the fire, which he stirred to a cheery blaze, and bade her sit there and roast, as he had often nipped a cold in the bud by getting very hot.

He scrupulously avoided looking at her face as he did so; and during the silent hour that ensued, he only now and then stole a glance at the girlish figure, and the little, white face with the great eyes fixed on the blaze. Surely, it was a good thing there were no more sittings needed for the picture, or else that look might have crept into the picture unawares, as the look of recognition and the look of love had come—this new look, that was so pathetically like a broken heart.

They had often had such silent times before; when Ludlow was much absorbed in his work or his thoughts, he would not scruple to be silent, and leave Sage to her own devices; and so now the girl, with that instinct common to man and brutes to hide their hurts, comforted herself with the feeling that there was nothing

remarkable in the silence, and that it was an infinite relief that Mr Ludlow was so engrossed by his picture, though she could not quite remember which it was.

And so she spent all that September afternoon in profound quiet in the soft, rainy dullness, turning the leaves of the book that had lain open on the chair, hardly noticing what book it was, only feeling that it had been left there by the hand that had held hers the night before, and that most likely would never hold hers again.

If she had noticed where it lay open, it might have given her a clue to the reason of Maurice Moore's sudden departure; but I hardly think it would have occurred to her to connect herself in any way with ‘the lily maid of Astolat,’ however ready she might have been to compare Maurice Moore with Sir Lancelot.

It was Tennyson's ‘Idylls of the King,’ and, on the story of Lancelot and Elaine, Owen Ludlow had founded his lecture to Maurice the night before.

As has been said, Maurice came in from that lingering moonlight walk with Sage with an unaccountably apologetic feeling in his mind; and one glance at the painter's face told him he was in for it; and he sat down in the chair opposite his old friend with a look of comical concern that was not entirely a joke, and said: ‘Go it, old chap; but draw it mild, and let me light my pipe first.’

But he was not prepared for the way Ludlow began, and the somewhat forced merriment died away from his face.

‘I’ve told you about my wife; haven’t I, Moore?’

Maurice nodded.

‘But I don’t think I ever told you of her baby, a little girl who, if she—had been with me now would have been just the age of this little Sage Merridew, and I sometimes think might have been not unlike her.’

‘Ah!’ Maurice said sympathetically between the puffs of his pipe.

‘It is partly this that has made me take such an interest in the little girl, and— Maurice, old man, I think I feel as much about her happiness and peace of mind as I should about my own daughter’s.’

‘You don’t suppose?’—

‘No; I don’t; but I am pretty sure that what’s play to you is deadly earnest to that poor child.’

‘Do you think I have no gentlemanly feeling?’

‘I know you have, and that is why I am speaking to you to-night, for you have quite a right to say it is no concern of mine, and that I’m a meddling old fool.’

‘Ludlow! you of all people!’

‘Yes; all right. I know you think I have a right to interfere in your concerns, because I gave you a pill and draught years ago. I don’t think I have any right on that score; but never mind; if you think so, I’ll avail myself of it, and say: “Mind what you’re about with this little girl, as you don’t mean to marry her.”’

Maurice laughed; but it was an awkward, uncomfortable laugh.

‘Upon my word, Ludlow, this is the first time I have ever had my intentions asked. Nobody

cares what the intentions of an unlucky beggar like me may be. I'm what they call a detrimental; it's only elder sons and millionaires who are supposed or permitted to have matrimonial intentions.'

'That's just it. Your marrying Sage Merri-dew is out of the question.'

'Quite. Every one must know it.'

'No; she would not. Your income—what is it? two or three hundred a year—would sound like wealth to Dr Merri-dew's daughter, who could live pretty comfortably on what you spend in gloves and button-holes.—Oh no! I know well enough it's not wealth by any means. I know, quite as well as you do, that it would be sheer madness for you with your expensive tastes to marry on that, even—if you wished it.'

Maurice was silent, pulling at his moustache rather savagely, and letting his pipe go out. It was quite true; but it was not pleasant to hear Ludlow say it.

'It would not matter a bit with one of your society girls; they are made of sterner stuff than little Sage, and can give and take and be none the worse; but with Sage it's different—it's all give, and no take; and that's a terribly losing business.'

'Well,' Maurice said impatiently, getting up and walking up and down the room, 'anyhow, there's only one more day of it, and then I shall be off, and she will forget all about me.'

'If she can.'

Then there was silence for a bit, with Maurice pacing the room, and Ludlow lying back in his chair, puffing at his pipe; but at last he said—and Maurice thought at first that he was abruptly changing the subject and perhaps wishing to have done with it: 'Maurice, do you remember the story of Elaine, that poem of Tennyson's?—Yes; I expect you do, for I used to spout it to you often enough at the ranch. I was mad about it then, and knew every line.—Well, don't you remember the father's appeal to Lancelot, when he was leaving?

Too courteous are ye, fair Sir Lancelot.
I pray you use some rough discourtesy
To blunt or break her passion.

It has been running in my head while you have been wearing out Mrs Stock's carpet with your perambulations.'

Then further silence and more paces, and at last Maurice said: 'Ludlow, old fellow, I think I'll go up by the early train to-morrow. There's a fellow I want to see in London.' He said it in a hurried, shamefaced way, avoiding the painter's eye, and being very busy cleaning out the stem of his pipe with a straw. 'I'll just step over to Shingle; and you can send my traps after me later in the day. All the same, I think it's a great piece of nonsense. Girls' hearts are not so brittle as you seem to imagine. Little Miss Sage will forget all about your humble servant in a few days; and some smart, young medico will turn up far more to her taste.—Well,' he added, with a very evidently simulated yawn and stretch, 'I think I'll turn in, as I shall have to be such an early bird to-morrow to catch the train, instead of the worm. Good-night and good-bye, old man.—And I say, Ludlow'—he turned with his hand on the door, and there was a very

genuine, little shake in his voice—'I think you might spare a crumb of pity for me from all the big loaves you are lavishing on her, for, by Jove, I don't think the pain is all on her side.'

BEEHIVE HUTS.

By S. BARING-GOULD.

IN Dr Mitchell's *The Past in the Present*, one of the series of Rhind Lectures, the author describes his amazement on visiting the island of Lewis, in the Hebrides, to find there hovels inhabited by human beings that have been generally supposed to have belonged to a prehistoric savage period of our islands. He says: 'My first visit to one of these houses was paid in 1866 in the company of Captain Thomas. They are commonly spoken of as beehive houses, but their Gaelic name is "bo'h" or "bothan." They are now only used as temporary residences or sheilings by those who herd cattle at their summer pasturage; but at a time not very remote they are believed to have been the permanent dwelling of the people. I cannot suit my present purpose better than by telling what Captain Thomas and I saw on the occasion of the visit to which I have referred. At Larach Tigh Dhubhstail, the summer pasturage of the tenants of Crolisra, we found one of these beehive houses actually tenanted, and the family happened to be at home. It consisted of three young women. It was Sunday, and they had made their toilet with care at the burn, and had put on their printed calico gowns. None of them could speak English; but they were not illiterate, for one of them was reading a Gaelic Bible. They showed no alarm at our coming, but invited us into the "bo'h," and hospitably treated us to milk. They were courtously dignified, neither feeling nor affecting to feel embarrassment. There was no evidence of any understanding on their part that we should experience surprise at their surroundings. I confess, however, to having shown, as well as felt, the effects of the wine of astonishment. I do not know I ever came upon a scene which more surprised me, and I scarcely know where or how to begin my description of it.

'By the side of a burn we saw two small round hive-like hillocks, not much higher than a man, joined together and covered with grass and weeds. Out of the top of one of them a column of smoke slowly rose; and at its base there was a hole about three feet high and two feet wide, which seemed to lead into the interior of the hillock—its hollowness, and the possibility of its having a human creature within it, being thus suggested. The dwelling consisted of two apartments opening into each other. Though externally the two blocks looked round in their outline, and were in fact nearly so, internally the one apartment might be described as irregularly round, and the other as irregularly square. The rounder of the two was the larger, and was the dwelling-room; the squarish and smaller one was the storeroom for the milk and food. The floor-space of this last was about six feet each way. That of the other was about six feet in its shorter and nine feet in its longer diameter.

The greatest height of the living-room—in its centre, that is—was scarcely six feet. The door of communication between the two rooms was so small that we could get through it only by creeping. The creeping was only a little less real in getting through the equally tunnel-like, though somewhat wider and loftier passage, which led from the open air into the hut or dwelling-room. At the right-hand side on entering there was the fireplace. The smoke escaped at a small opening at the apex of the door. The floor was divided into two spaces by a row of curb-stones eight or more inches high. These served as seats, the only seats in the house; but they at the same time cut off the part of the floor on which the inmates slept, the bed, in short—the whole space behind the row of stones being covered with hay and rushes. In the part of the wall bounding the bed there were three niches or presses, in which, among other things, we observed a hair-comb and some newly-made cheeses.

The walls of these Beehive Huts are made of stone, undressed, laid in rude courses; and the dome is constructed by bringing the courses to overlap, till at length they are drawn together so closely all round as to leave nothing but a small hole, which may be closed at pleasure with a turf or a stone, or left open to admit light and allow the escape of smoke.

In some cases the houses are more extensive, with several chambers, all constructed in the same manner, and all domed in the same fashion, so as to resemble a series of conical hills united at their base.

But what is exceedingly interesting in the description of the Lewis houses in occupation is that they resemble precisely a number of ruined structures scattered over not Scotland only, but the moors of Devon and Cornwall as far as the Land's End, so that the description of the house in Lewis might be taken as that of one on the tract of moor that stretches from Bodmin to Camelford, or, indeed, of numerous ruined prehistoric settlements on Dartmoor. Not only so, but it inevitably reminds the reader of the internal structure of a great many cairns and tumuli for the dead. In fact, there can be very little doubt that the mansions of the dead were at one epoch made in very close resemblance to their habitations when alive, and that their habitations when alive were beehive huts.

The rude stone monuments in Scotland have been very carefully examined and planned, and among these are the sepulchral chambers in the cairns both circular and oblong. They present very much the same character, of passages leading into chambers, these chambers either roofed over by broad slabs of stone or domed by narrowing layers of stone. There are frequently small side compartments for the dead, very much as in life they may have had compartments in their beehive huts for their beds.

There are to be found in Cornwall some of these beehive huts almost as perfect as when first constructed. Originally, indeed, they were embedded in peat-banks, or walls of turf to the width of nine feet. This has in a great number of cases disappeared. It has been washed away by the rains, so that only the skeleton, so to speak, of the old house remains, the stonework

which was not originally exposed. There is, however, on the south flank of Dartmoor, on the side of the river Erme, a beehive hut that is still in great part buried in its turf case, now luxuriantly overgrown by heather. The entrance consists of two granite jambs about two feet six inches high with a granite lintel, still in place. On crawling within, the structure is seen to be precisely that of the Hebridean beehive houses. It is domed over by layers of overlapping stones.

It is the same with several under Brownwilly, the highest of the Cornish tors, and sufficiently remote from habitations not to have become a quarry for builders. The top of Brownwilly consists of a ridge with five peaks of granite; on two of these are great cairns, that have never been explored. A little way under the brow of the hill to the east, below the easternmost cairn, are two almost perfect beehive huts nestled like swallows' nests into the rocks. One joins on to the other very much like the structure in the Hebrides described by Dr Mitchell, only that the storeroom is but four feet six inches in diameter. Both are part domed and part roofed with covering slabs, and natural rocks have been utilised for one side of each.

Below Brownwilly is a solitary farm, and between the farm and the stream is a beehive hut quite perfect, even to the smoke-hole, with the stone at top covering it. This chamber is rudely square within. It is quite possible that this, like the Hebridean huts, may be of much more recent construction, may even conceivably not be more than a hundred years old. In which case in Cornwall, as in the Hebrides, the old mode of construction in use in primeval times has been blindly followed to a comparatively modern period. This is possible in Cornwall; in the Western Isles it is certain.

But not only does the description of the 'bo'h' still in use apply in its general features to the beehive huts of the west of England, but it does also in even minute particulars, such as the division of the main apartment by curbstones to form the bed. Even these stones are found—or one is much deceived in some of the remains of beehive huts on Dartmoor and in Cornwall, and without the light thrown on their significance from actual usage by Dr Mitchell, the antiquary exploring with the spade among the ruined hut circles in the west of England would be much puzzled to account for the divisions his spade encounters when making out the plan of the floor. The little lockers Dr Mitchell saw in use are also found in the prehistoric dwellings, though no longer containing cheeses and hair-combs.

These beehive huts are found in clusters, villages, almost towns of them, though rarely with their domes complete, for in probably the majority of cases they were not stone domed, but roofed over with logs or poles brought together in the centre, and covered with thatching of straw or ling.

Dr Mitchell informs us that many of the primitive cottages in the Hebrides have their roofs pulled off and renewed every year because of the value as manure of the thatching impregnated with peat-smoke and black with soot. It may have been the same with the prehistoric cottages; but certainly only here and there was one domed

over with stone, the majority were merely thatched.

That these habitations belonged originally to a people who erected megalithic monuments can hardly be questioned, as almost invariably a village of circular huts has on the hill above it cairns containing kistvaens, and very generally avenues or circles of upright stones in its neighbourhood. In many if not most cases in Devon and Cornwall, this people was a mining people and worked for tin. The settlements are generally associated with old tin stream-works. And the workings may be observed to turn round and avoid a spur of ground occupied by some of the huts. That the people were a flint-working race is also apparent from the numbers of flint weapons and chips found near these settlements. And the flint not being found near, had to be brought, and was an object of barter with the natives of the chalk and flint districts.

We do not know enough of the primitive population of the British Isles to say which was the beehive hut dwelling race. But it is certainly remarkable that in Devon and Cornwall, where not only the Cymric branch of the Celt came, but also the Gael, leaving traces in the forms of the names of places and people, that we should find houses of precisely similar construction to those still extant, and still used in the Gaelic islands in the west of Scotland.

At the same time it would be unsafe to rush to a conclusion from such coincidences. If we turn to Mr Hall's 'Life among the Esquimaux,' we find that this primitive people construct their igloos or snow-houses on a precisely similar pattern, even to the raised platform for the bed. Primitive man is much alike everywhere, and to whatever race he belongs, he seeks out the simplest form of habitation, and it is only as he advances in civilisation that he varies his type, and that he becomes impatient of the simplicity and rudeness of the habitations of his ancestors.

THE BURDEN OF ISABEL.*

CHAPTER XXXIX.—OUT OF THE 'CORNER.'

WHILE Suffield pondered during the next day or two how it could be brought home to Gorgonio that the five hundred pound note which he had received from Tanderjee was his share of the Tanderjee cotton fraud—which Suffield did not for a moment doubt—a letter was on its way to him from Marseilles from his son concerning this very matter. George was returning home with both criminals; but they were all so worn with fatigue that they could not set out so soon or travel with such speed as the letter, which was mainly written to advise the arrest of Gorgonio (if possible): Tanderjee had denounced him as a participator not only in the cotton fraud, but also in the theft of the plans!

That letter reached him at a critical moment, and with it in his pocket he went to Liverpool to call on Gorgonio. It was only three days to the 31st of January, when all the cotton transactions in which Gorgonio and his son were involved must close, and when the

final reckoning must be made up according to the prices with which the month would close. He was therefore determined to make a final effort, by means of a threat, to encourage Gorgonio to get rid of most of the cotton promises at a tolerable price before the final, fatal day. When Suffield entered Gorgonio's office, the latter merely sat back in his chair and waited: their relations were too strained for the exchange of civilities.

'More than a month ago, Mr Gorgonio,' said Suffield, taking a seat, 'you received from Mr Tanderjee one of several notes for five hundred pounds, the which he had received from the bank in payment of a cheque which my son gave him: would you mind telling me why Tanderjee gave you that note?'

Gorgonio looked at his claws a moment and then at Suffield. 'Yes,' said he, 'I remember. Tanderjee gave it to me in way of business—yes; in payment of matter of business between myself and Tanderjee.'

'Will you swear, if required, that the matter of business for which Tanderjee paid was not the help you had given in his cotton fraud, and in another matter concerning my affairs which I will not name at present?'

'Who say that, Mr Suffield?' exclaimed Gorgonio, turning a very evil colour. 'Who, Mr Suffield, have the impudence to say such thing?'

'Tanderjee has,' answered Suffield calmly.

'Tanderjee?' Gorgonio looked about him in perplexity. 'When can Tanderjee have say that? Tanderjee is gone!'

'But he will come again!' said Suffield. 'He is on the way back now—under the charge of my son and a detective.'

'Ah—that, then, is the reason,' exclaimed Gorgonio in a burst of enlightenment, 'why Mr Suffield, younger, go away on voyage! That is so!'

'Well, then, Mr Gorgonio, is Tanderjee a liar?—or, has he told the truth?'

'Tanderjee is liar, certainly! I will tell him he is liar, to the face—when he come!'

'Will you be prepared, when Tanderjee and the other man stand their trial, to clear your character, and give the details of the business for which Tanderjee paid you five hundred pounds?'

'I will, Mr Suffield!—Pon my sacred word of honour, I will!'

'Mr Gorgonio,' Suffield broke forth at length, 'I believe you to be a creature without honour or honesty!—to be a liar and a thief! It would do me good to be able to kick you into the street, and down the street, and into the Mersey—and so out of England, which creatures like you pollute wi' your presence! But I can't afford to do that! It is my deplorable lot at present to be tied to you—sink or swim! You would be glad if I sunk, I know; but—please Providence!—I don't mean to sink if I can make use of a reptile like you!—you've done badly for me in this cotton business, for your own ends, as I believe, though—God help me!—I can't prove it! But now I give you one chance to do better! There are three days left! If by the end of that time you haven't unloaded at a fair price, at least three-fourths of these responsibilities that still remain—I can't

* Copyright reserved in the United States of America.

in reason ask you to do more than that in the time, but you know how to manage it'—

'I cannot!—no man can!—do that—I have say again and again, Mr Suffield, that you cannot unload much and not send down the price! And it is not possible to unload so much as, you say in three days at any price!'

'Then,' said Suffield, 'I shall have you arrested to stand your trial with the two others! If you accomplish what I ask, I shall say no more about this!—That is my last word!'

Suffield rose to go; and there was about Gorgonio, as he leaned over the table, and, with a snarl on his lip, glared at the big Englishman over his hunched shoulder, something of the ugly, obscene suggestion of the hyena at bay in his cage—some hint of the brute's evil temper, evil colour, and bristling back.

'I will try to accomplish what you say. It is difficulty; but I will do it!'

'Very well,' said Suffield, and went.

It was a desperate task that Gorgonio had promised, under compulsion, to perform—so desperate, that he would seem to have soon determined to abandon it. For the past fortnight he had really sold much less than he had reported to Suffield that he had sold, holding on with the gambler's hope of emerging on the last day of the month in possession of a considerable 'corner,' and so of forcing up prices and reaping his profit in spite of Suffield, even if he also made—as he would make—a profit for Suffield too. But when the sturdy Suffield presented his ultimatum, he had a horrible vision of final ruin, of trial in a terrible English court, where a man cannot bribe, of imprisonment in an English jail, whence it is difficult for a man to escape: then panic seized him—as in an unforeseen emergency it often does seize the craftiest, coolest man and the most savage and courageous brute—his nerve went, and he could think of nothing but flight.

In the afternoon of the day before the last, Suffield received a telegram signed 'Gorgonio,' and demanding an immediate interview. Suffield went; but when he arrived at Gorgonio's office he found no Gorgonio. He was received by the confidential clerk of Gorgonio, who said that his master had not been in town all day, nor had sent any explanatory word; that he (the clerk) had first telegraphed to his home in the suburbs, and had then gone to it: the house was shut up, and no news of Gorgonio was to be had! The only possible conclusion was that Gorgonio had fled!

'And,' said Suffield, 'if I have driven him out of Lancashire, and perhaps out of England, I shall reckon I ha' deserved well o' my country! But he must ha' gone because this business is in a bad way.—You're an Englishman, I hope, my lad?'

'I'm a Welshman, Mr Suffield,' said the young man with a smile.

'That's the same thing, my lad. I can trust tha. Tha knows all Gorgonio's business, I suppose? Well, then, show me all this business, and help me to decide what's to be done, and thou shannot lose by it.'

So they sat down together and went through the records of all the transactions; and it became evident to Suffield that comparatively little had

been sold—that more than one hundred thousand bales of contracts still remained.

'Why, Mr Suffield,' said the young man, 'you command the market yet! If you don't sell to-morrow—if you decide to hold the corner—prices will go up, and you will make a big haul!'

For one hesitating moment a vision danced before Suffield of a profit, instead of a loss—his apparently prosperous position maintained and established instead of shrunk into something like poverty; his daughter's distinguished marriage coming to fruition instead of being perhaps blighted; and his wife's innocent ambitions fulfilled instead of thrust into the limbo of first-loves, broken promises, and wasted efforts. The dream lasted but a moment: the next he had recovered himself.

'No,' said he, 'I'll sell out! I'd rather lose half my capital than ha' it said of me I ever made a penny by cornering! Sell out, my lad; sell carefully and craftily, so as not to scare the prices—but sell!'

He decided, after a little hesitation, that there would be no advantage in his remaining in Liverpool for the last day, especially since he desired that he should not be openly identified with this business; and he left the confidential young man with the assurance that he trusted him, and the encouragement to do his best.

The record of the last day is common property: was it not written and published in all the newspapers of the principality, under the heading 'Final Collapse of the Corner?' Thus the leading Liverpool daily wrote of it: 'On the last day the opening quotation of the market was 6'15, and for the first hour it ran down and up with remarkable uncertainty till 6'10 was reached. It then became evident that many "bulls" had been riding on the back of the leading operator, in the hope that he would help the market at the close. It was remarked as strange that the leading operator, Gorgonio, had not been seen; but it was rumoured that he had been quietly selling through another. The rumour spread, and then others scrambled to get out; and the prices fell down, down till 5'16 was reached as twelve o'clock struck.'

All the while Suffield was in telegraphic communication with Liverpool. Messages came regularly, marking, as it were, the quarters of each hour, and chronicling in the most unfeeling way the fluctuation, and then the steady declension, of the prices; and at the same time a clerk was kept passing to and fro between the office and the Exchange to check the telegrams by the prices registered there. Thus the quarters passed rapidly away, until half-past eleven. At that hour Suffield left the office and went on 'Change to 'see the last of it,' as he said to himself. He walked up the noble crowded hall, and as he passed to his usual station the hubbub was hushed, and all eyes were turned on him, to observe how he was taking it. The anxiety of the past month had wrought a greater change on him than he was aware: the careless, boyish ruddiness of his cheek was gone, and his hair had become white. He was there to show that the worst would not break him, that he still meant to hold his head up among his fellows, and that if there was any man on 'Change had aught against him, he was ready to listen to his

demand; and there was more than one creditor there who had meant to descend upon him, but who, seeing him, held his hand: they were proud now to have so much personal interest in him as to have him in their debt.

About ten minutes to noon his clerk brought him a telegram reporting that the price was 5·16, and that there still remained so many bales.

'Thank God!' said he. 'It might be worse!'

He lingered a few minutes longer, chatting to old acquaintances about other things than cotton; and then, when the hour struck which closed the business of the last day of the month on the Liverpool Cotton Exchange, he left his place and walked out. He had sacrificed the corner, but he had saved his business; and they all guessed it! The throng, as if involuntarily, made an avenue for him and took off their hats as he passed—an action to which he responded by taking off his own—and as he went out at the wide portal, a ringing cheer broke forth: 'Bravo, George!'

Suffield's heart was stirred within him, and reinvigorated. 'I'm turned fifty,' he said to himself, 'but I'll make my business again!—And now I'll sleep to-night!'

JOTTINGS ABOUT BANK-NOTES.

IN the British Museum there is a very old and very rare Chinese Bank-note. It was issued in the reign of Hung-woo, the founder of the Ning dynasty, who died in 1398. The face-value of the note is about a dollar; but it is one of the only issue of paper currency ever guaranteed by the Chinese Government. (Only another similar note is said to be in existence, being in possession of the Oriental Society of St Petersburg.) Its value to native bankers and note-collectors all over China is well known. The late Governor of Hong-kong, Sir John Pope Hennessy, bought the note about twelve years ago at an auction of the effects of a deceased Captain of one of the Chinese Customs cruisers, who had amassed a large collection of Chinese coins and notes, amongst which was this Ning bank-note. The Captain had acquired it for a very considerable sum from the successors of a continental banker, who had been a collector of rare Chinese coins and bank-notes. Sir John was in the habit of leaving it for safe-keeping in the custody of the authorities of the British Museum. The note is said to answer the description of the paper which, according to Marco Polo, the Great Khan, six hundred years ago, caused 'to pass for money all over his country. What they take is a fine white bast, or skin, which lies between the wood of the trees and the thick outer bark, and this they make into something resembling sheets of paper, but black.'

Bank-notes were issued in China as early as the ninth century, when the art of printing was unknown in Europe. These notes have generally been redeemed, because in China, when a bank fails, all the clerks and managers have their heads chopped off and thrown in a heap along with the books of the firm. And so it has happened in these good old barbarous times that for the past

five hundred years not a single Chinese bank has suspended payment. Now that China is coming under the sway of Western civilisation, we have no doubt it will have the same financial troubles as its more civilised banking brethren.

Since the English one pound bank-note was abolished in 1821, a preference has arisen in England for the sovereign, although the value of the latter is often diminished by what is known as 'sweating,' by attrition, and by the tear and wear of daily use; whereas the one pound note suffers rather by violence, and its face-value, with ordinary usage, remains unimpaired. We are informed that Americans when they come to England are astonished at our use of specie in ordinary business, and express their surprise that we have not adopted the fractional currency which they find so convenient. An eminent banker remarked the other day: 'Payment in coin is, after all, the method of barbarous people; and the time may come when a man getting out of a hansom at his door will pay the driver with a small note like a postage stamp.'

Bank-notes have an individuality which gold lacks, and being easily identified when 'ear-marked,' serve often as links in the chain of criminal detection. This was illustrated a few years ago during what was known as the 'turf frauds.' The complicity of several detectives in that elaborate conspiracy was discovered through a bank-note of a large denomination being presented for payment. Because of a theft of notes of a certain bank, all the notes of that denomination had been recalled from circulation, with the view of isolating the stolen notes that were outstanding. One day, a note of this description was cashed to a respectable person at a branch of the bank that had issued the notes. The banker at once informed a police official of the transaction, and said it had the name of a leading detective officer on the back of the note. The police official obtained the name, and wrote up forthwith to the metropolitan authorities on the subject. No reply came. At the end of some days, business called him to London, and he asked the chief of the department to which he had written if his letter had been received. 'What letter?' was asked. None had reached him, as it had been destroyed, to avert suspicion. A duplicate of it was at once wired for; a clue was established to the crime; and in the end a gigantic conspiracy of detectives and criminals was unravelled and exposed.

Bank-notes have curious histories attached to them in the way of human comedy, tragedy, and melodrama. A collector at Paris of such curiosities got hold, some years ago, of a five-pound Bank of England note which had somewhat of a tragic interest connected with it. Some sixty odd years ago the cashier of a Liverpool merchant had received in tender for a business payment a Bank of England note which he held up to the scrutiny of the light, so as to make sure of its genuineness. He observed some partially indistinct red marks of words traced out on the front of the note beside the lettering and on the margin. Curiosity tempted him to try to decipher the words so inscribed. With great difficulty, so faintly written were they and so much obliterated, the words were found to form the following sentence: 'If this note should fall into the hands of John Dean,

of Longhill, near Carlisle, he will learn hereby that his brother is languishing a prisoner in Algiers.' Mr Dean, on being shown the note, lost no time in asking the Government of the day to make intercession for his brother's freedom. It appeared that for eleven long years the latter had been a slave to the Dey of Algiers, and that his family and relatives believed him to be dead. With a piece of wood he had traced in his own blood on the bank-note the message which was to procure his release. The Government aided the efforts of his brother to set him free, this being accomplished on payment of a ransom to the Dey. Unfortunately, the captive did not long enjoy his liberty, his bodily sufferings while working as a slave in Algiers having undermined his constitution.

A famous historical inscription is that which Lord Cochrane, the great seaman, penned on a one thousand pound Bank of England note which he tendered in payment of what was afterwards pronounced to be an unjust fine. He had been debarred, during his period of imprisonment, of the common privilege of taking open-air exercise in the prison-yard, to the detriment of his health. There was no alternative left him but to pay. He thus expressed himself on the back of the note: 'Grated chamber, King's Bench Prison, July 3d 1815.—My health having suffered by long and close confinement, and my oppressors being resolved to deprive me of property or life, I submit to Robbery to protect myself from Murder, in the hope that I shall live to bring the delinquents to justice.'—(Signed) COCHRANE.

On the 6th of August of the same year, a collection was made in the parish church of Sorn, Ayrshire, in aid of the Waterloo Fund, when thirteen guineas were received. On one of the notes then put into the box the following lines were written:

FOR THE SUFFERERS AT WATERLOO.

Yes! there were deeds of wonder done
Round Britain's flag, to death unfurl'd:
The chaplet torn, the laurels won,
From bands who conquer'd half the world.

Another contribution to bank-note literature is found in Lockhart's 'Life of Scott.' Lady Louisa Stuart sent the great novelist a copy of some lines which were also written on a guinea note, then in possession of Lady Douglas. They were as follows:

Farewell! my note, and wheresoe'er ye wend,
Shun gaudy scenes, and be the poor man's friend.
You've left a poor man; go to one as poor,
And drive despair and hunger from his door.

Sir Walter expressed himself as very much pleased with these lines. Their sentiment seems to have struck a congenial chord in his benevolent breast, for he added: 'I think it will give the author great delight to know that his lines had attracted attention, and had sent the paper on which they were recorded, heaven-directed to the poor.'

Robert Burns knew the value of Scotch notes. In a letter to Mr M'Murdo, dated December 1793, he says: 'But for these dirty dog-eared little pages,' &c. This, unfortunately indicated what was the poet's normal pecuniary condition. When thinking to leave for Jamaica in 1780, he penned the following lines on the back of a

guinea note of the Bank of Scotland, which had then as now a branch in Dumfries:

Wae worth thy power, thou cursed leaf!
Fell source o' a' my woe and grief!

For lack o' thee I leave this much-loved shore,
Never perhaps to greet old Scotland more.

Happily for Scotch poesy, Burns did not go to the West Indies, but remained at home to pour out the treasures of his muse.

The 'leaf' on which Burns wrote this inscription was a one pound note of the Bank of Scotland issue of 1st March 1780, as Scott Douglas states in his edition of the poet's works. The lines are believed from their internal marks to have been written about August 1786, and they appear to have been first printed in the 'Morning Chronicle' of 27th May 1814, being subsequently transferred to the 'Scots Magazine' in the following September.

There is a great deal of writing on bank-notes which is mainly the product of the love of scribbling possessed by a good many persons. Much of it is ridiculous rhyme unworthy of repetition; but occasionally it is smart and apposite to the purpose of bank-notes. A sample or two of such writings may be given. On a pound note appeared the following:

Ye ugly, dirty, little scrap!
To look at, hardly worth a rap;
And yet I'll give my hearty vote
None can produce a sweeter note.

Another inscription is:

It's odd that any man should wish
A dirty, scabbit rag like this;
Yet mony a ane would cut a caper
To get a wheen sic bits o' paper.

This other quotation contains a blend of sentiment and pessimistic reflection:

Ye're my ain, ye're my ain,
And to keep ye, I'd be fain;
But the poor man can never keep his cash;
For 'twill gang, quickly gang,
Like an easy-goin' sang,
Let ye be however carefu' or rash.

Oh! money's no the thing for the poor man to keep;
Oh! little's the interest that the poor man's cash can reap;
It maun gang to fill the coffers o' the rich and the great;
And I, like a' the rest, must quietly bow to fate.

When bank-notes are presented for payment in a defective condition, from whatever cause, it is the practice of some banks to pay according to the proportion of the note which is presented. Thus, if four-fifths of a one-pound note were tendered to a bank, it would pay sixteen shillings to the owner; and if two-thirds of a five-pound note were offered, the bank would give the owner three pounds six shillings and eightpence only. Other banks are in the habit of paying the amount claimed, or nothing at all. In every case, an affidavit must be subscribed before a justice of the peace in support of each claim, which must contain a narrative of the circumstances attending the partial or, as sometimes happens, the complete destruction of the note. In the latter case, the bank when it makes payment always insists on a guarantee.

As may be supposed, the greatest amount of

claims in connection with the destruction of notes arises in Scotland after the New-year's holidays and convivial seasons generally. Pipe-lighting is the commonest form of destruction, notes especially for one pound being stowed away in any pocket handy and used as if they were mere match-paper. These notes get torn in domestic brawls, are snatched at by thieves, and occasionally thrown into the fire, to be hurriedly extricated from the flames. Dogs, cattle, sheep, and cats chew them. Landladies have been known to wash their lodger's garments containing notes, reducing them in the process to a sad state of pulp. Hens have pecked at them, pigs have gulped them, mice have nibbled them, and even jackdaws have stolen them to coat their nests. Notes indeed are liable to many vicissitudes, being wholly at the mercy of their owners. In the north of Scotland, most claims arise from fishermen, whose bank-notes suffer from the varied incidents which take place in the pursuit of so perilous a calling.

Bank-notes have not now so long an existence as formerly. When Bank of England notes re-enter the portals of the Bank of England, they never return into circulation, it not being the practice of the Bank of England to issue them a second time. If notes are stopped payment at the Bank of England, it must be done under a guarantee, which usually takes the form of an assignment of Government stock in security to the Bank of England, and is of the value of the notes stopped. There is a story which goes so far back as the year 1740, and it is to the effect that a director of the Bank of England of that day lost a bank-note for thirty thousand pounds. It was said to have been carried by a draught of air up the chimney, where it lodged in an out-of-the-way crevice. Its fate was not known at the time to the director, who supposed it destroyed, for he made a successful claim on the Bank for the amount. Years afterwards, when the building was being dismantled, the masons engaged in taking to pieces the chimney discovered the note in question. The Bank had to pay the value of the note again on its presentation by the heirs of the deceased director, for the latter had come under no obligation to indemnify the bank in the event of the missing bank-note making its appearance.

The Scotch bank-notes in circulation are not nearly so dirty as they used to be. The great majority of the notes have an existence of from one to two years, and many of them much less. They are withdrawn from circulation whenever their external appearance is unsatisfactory, and are consigned to the flames, the close retort being most commonly used in their destruction. Several banks have big occasional burnings; while others have numerous burnings for smaller amounts.

The life of a Bank of France note is about two years, it being issued so long as it is usable. In the matter of destroying their notes set apart for cancellation, a new departure has been made by the Bank of France. The former practice was to incarcerate their doomed notes for three years in a large oak chest before submitting them to conflagration. Thereupon, a huge fire was set aflame in an open court; the notes were thrown into a sort of revolving wire-cage, which was kept rotating over the fire; and the minute

particles of note-ash escaped into the air through the meshes of the cage and darkened the atmosphere all around. The burnings took place daily, and were of a certain amount. Now, the practice is to have about twenty cancellations of notes each year, at uncertain times, and as the needs of the service determine. A hole is punched in each of the notes, which are also stamped as follows: 'Cancelled the _____ by the branch at _____, or the Head Office of the Bank of France.' The notes are then marked off in the registers of Bank Notes Issued, according to their numbers and descriptions. A Committee of the Bank directors are present at their destruction. The cancelled notes are no longer burned, but are now reduced into pulp by means of chemical agents. Each destruction of notes averages about six hundred thousand of all kinds; and about twelve million notes are annually destroyed. The Bank of France has been little troubled of late with forgeries. The greatest forger it ever had was deported to Cayenne, and in attempting to escape, got stuck in a swamp, and was eaten to death by crabs.

Like the Bank of France, the Imperial Bank of Germany has no set time for destroying its notes. It only does so when a stock of cancelled notes has accumulated in its hands. These notes have a hole punched out of them. The agency employed in their destruction is fire, a close furnace being used, so that the possibility of any particles of burnt notes making their escape therefrom may be put beyond a doubt. The notes are placed in this furnace beside some lighted straw, which sets the notes aflame. No fuel, whether of coal or wood, is used, the notes, fanned by a current of air, maintaining their own fire, and burning until they are wholly consumed. The economy of this arrangement may be noted. The Imperial Bank of Germany has burned 10,355,364 notes within the last ten years, and of the following denominations: 686,460 notes of one thousand marks (£50); 517,030 notes of five hundred marks (£25); and 9,151,874 notes of one hundred marks (£5).

With the Bank of England, the destruction of its notes takes place about once a week and at seven P.M. It used to be done in the daytime, but made such a smell that the neighbouring stockbrokers petitioned the Governors to do it in the evening. The notes are previously cancelled by punching a hole through the amount (in figures) and tearing off the signature of the chief cashier. The notes are burned in a closed furnace, and the only agency employed is shavings and bundles of wood. They used to be burnt in a cage, the result of which was that once a week the City was darkened with burnt fragments of notes. For future purposes of reference, the notes are left for five years before being burned.

The number of notes coming in to the Bank of England every day is about fifty thousand; and three hundred and fifty thousand are destroyed every week, or something like eighteen millions every year.

The stock of paid notes for five years is about 77,745,000 in number, and they fill 13,400 boxes, which, if placed side by side, would reach two and one-third miles. If the notes were placed in a pile, they would reach to a height of five and two-third miles; or if joined end to end,

would form a ribbon 12,455 miles long. Their superficial extent is rather less than that of Hyde Park; their original value was over £1,750,626,600; and their weight over ninety and two-third tons.

THE CAMERA-OBSCURA.

CHAPTER II.—CONCLUSION.

I LEFT the little wooden house wondering what was best to be done. Should I go straight to Helston or Falmouth for help, and bring a strong body of men direct to the underground cave? Or should I arrange matters so that the Nanjulians might be caught in the midst of their spoil? The latter course seemed most desirable to me. I remembered the sneers and sly laughter which had so often greeted my approach when they thought I had been engaged in watching their movements. I had gone home with tingling ears many a time when they had laughed at me in this way, and had comforted myself at such times by thinking that I should ultimately have the laugh at them. That time was come at last. Was it likely I would let the opportunity slip?

I made a hasty adieu to Bertha and her father, and went along the cliffs in the direction of Porthlock. My first intention was to proceed to Falmouth and get sufficient help for that night's work; but, as I thought the matter over, I decided not to do anything hasty. I wanted to win as much glory and credit by the affair as I possibly could, and it seemed to me that I had better exercise some ingenuity. For example, I was not yet certain that I had hit upon the right track. The cavern under the rock might not conceal the contraband goods of the Nanjulian tribe. To be sure I had no doubt about it in my own mind; but it would be as well to make the certainty absolute. If only I could get inside that cave and see for myself what its contents were, my doubts would be set at rest. But how to do it?

I went along the cliffs until I was exactly above the Six Sisters. There was not a soul in sight just there. Far away, nearly at Porthlock, I saw a black speck going along the level sands, which I believed to be the Nanjulian who had spread the sand over the trap-door after his brothers had gone into the cave. That seemed to indicate a long stay in the cavern. It would perhaps be advisable for me to hide myself, and watch for some one coming to release the men. Sooner or later, they would have to come out. When they were once away, I might find a chance of investigating their hiding-place.

I always carried food in my pocket, never knowing how long I might be kept out of the reach of my usual meals. I was therefore prepared to spend a long day watching the rock below. I went cautiously down the face of the cliff, and found a hiding-place where it was impossible for any one to see me, either from the cliffs above or from the sands beneath. Into this I crept, and fortified my mind for a long vigil by thinking what a fine thing this capture would turn out for me.

The day passed on slowly, more slowly, I think, than any day I ever remember. Morning

went, afternoon passed, and the winter evening soon came. I began to feel cold and numbed, though I had my thickest clothing on. I could now only just see the rock. The tide was nearly at its height, and four of the Six Sisters were almost submerged. Then, with an anathema on my own stupidity, I saw that it was impossible for any one to reach the fifth and sixth rocks by way of the shore. The tide made that impracticable. The men in the cave, then, would have to remain there until low tide, unless they had some means of letting themselves out. I hardly saw how they could do that, however. It did not seem possible for them to raise the trap-door from below. I left my hiding-place and went up the cliffs again. The moon had come out, and as the night was sharp and clear, there was a good view of any object on the headlands. At a little distance stood old Mother Trethewy's cottage, a solitary ramshackle old hut, in which no one but herself would have lived. She, however, being half-witch, half-ghoul, liked it probably from kindred feeling for aught that was weird and eerie.

There was a bright light in Mother Trethewy's window, which suggested heat, and consequent warmth. I thought it would do me no harm to spend a few minutes before the old woman's fire, and I went up to the door and knocked. She came to answer the summons with alacrity, and I fancied that she was rather disappointed on seeing my face.

'Let me come in and warm myself a moment, Mother,' I said, stepping across the threshold. 'It's terribly cold to-night on the headlands.' 'You're welcome,' she croaked, eyeing me, however, with anything but welcoming glances. —'Aw, 'tis terrible weather for a poor old woman like me.'

'Well, you've got a grand fire anyway, Mother.'

'It be driftwood, driftwood, just driftwood. A weary climb I do have many a day in summer to bring un up from the beach below.'

I sat down on a stool in front of the fire and spread out my hands to the blaze. The ancient crone sat down in her chair by the hearthstone and watched me. I tried to make her talk; but she was evidently not inclined to hold conversation with me. She kept glancing at me out of her wicked old eyes, as if I disturbed her.

'You've a nice quiet place here, Mother,' I said. 'No disturbing voices or anything to bother you. You'—

Just then a strange sound seemed to come from beneath my very feet. It was like somebody striking two or three blows with a heavy hammer under the floor of the cottage. I looked at the old woman in astonishment. She was obviously very ill at ease.

'What's that?' I said. 'I heard a sound.'

'A deal o' quare sounds there is here,' she croaked. 'They do say the place be haunted; but ne'er a sperrit have I seen. What wi' sounds and cockroaches, I do be pestered a'most to death. They cockroaches—there, that's the sixth I ha' killed to-night.'

She caught up a heavy poker and brought the point down with considerable force on a black speck on the hearthstone which might have been either a cockroach or a cinder. She was evidently

not satisfied with one blow, for she delivered one, two, three on the unfortunate object of her resentment, each resounding sharply from the hard stone. This done, she poked the ashes over the crushed speck.

'Well, I'm pretty warm now, Mother Trethewy,' I said; and bidding her good-night, left the cottage and went away along the cliff. Turning round, I saw her watching me from the doorway. I kept on my path.

But I did not intend to go far. Two matters had set me thinking. What did that dull knocking under my feet mean, and why did Mother Trethewy answer it as she did with three hard taps of her poker? Did it not mean that there was some one under the cottage who wanted to get out, and that Mother Trethewy had signalled to him, or them, that the coast was not clear? A third matter seemed to hold some relation to the other two. In one corner of the cottage stood a strong crowbar. What did an old woman like that want with a crowbar? It might have been left there by her dead husband—true! but it had been recently and constantly used, for the point was bright.

I went along the cliffs until a turn hid me from the cottage, and then I doubled, and went back to a point from which I commanded Mother Trethewy's door. I waited there, secured from observation, for nearly half an hour. At last the door opened and four men came out. They passed close by me, going towards Porthlock, and I recognised them as Matthew, Simon, Cleophas, and Pharaoh Nanjulian.

So at last, thanks to chance, I had come across the Nanjulians' secret. Underneath my feet lay their cave, with its sea-entrance at the Six Sisters, and its land exit in Mother Trethewy's cottage. I went homewards in good spirits. I would find my way into that cave and examine its contents for myself. That done, a raid should be made on the whole gang.

I occupied myself for hours that night in wondering how I could get into the cave. If I had not been so young and hasty, I should have sought superior counsel. As it was, I wanted to keep the matter all to myself, so that I might have all the glory and credit. My feeling was that I would not share the honour with a second party. It did not strike me that two heads are always better than one.

How to get into the cave unaided?—that was the question. I went to sleep thinking about it, and fell to thinking again as soon as I woke in the morning. Standing on the quay-side during the forenoon, I saw the Nanjulians, one and all, man their boats and go out to sea with several other Porthlock craft in company. I knew then that they would be away all day, and made up my mind to enter the cave in their absence.

At last a thought struck me: I must trick old Mother Trethewy. I must get her out of her cottage for some hours, and make use of the entrance, which I had no doubt I should find in the floor. A capital ruse soon occurred to me. The old woman sometimes went out nursing or laying-out dead bodies. I would send her a message telling her to go over to St Mirions, a village three miles inland, there to lay-out a fictitious person. She would go quickly enough, I knew, if there was promise of money.

There was a lad in Porthlock who had taken a great fancy to me, a lad who was somewhat of a harum-scarum type, and never up to anything but lurking and loafing round the quay-pool. I resolved to press young Nick Perran into my service. It was rather a scurvy trick to play on the old woman, but in dealing with rogues it is sometimes unavoidable to destroy them with their own weapons.

I found Nick Perran readily enough, and was soon walking with him in the direction of Mother Trethewy's cottage. He was delighted at the prospect of doing anything for me, and I had soon instructed him in his part. He was to knock at the door and tell Mrs Trethewy that she was wanted at the 'King George' inn at St Mirions to lay-out the body of a traveller who had died there suddenly. He was to give her five shillings, and say that fifteen more would be paid her when the work was done. When he had delivered his message, he was to go straight home to Porthlock.

I hid myself behind a conveniently placed rock while Nick advanced to Mother Trethewy's door. She soon answered Nick's summons, received message and money, and, judging from her nods and motions, promised him to go at once. The lad set off again in the direction of Porthlock; and within ten minutes more the old woman came out of her cottage carrying her basket. She locked the door behind her and set off over the headlands towards St Mirions.

I watched Mother Trethewy safely away. When she was a small speck in the distance, I went round to the rear of her cottage and looked about me for some easy entrance. There was a small window there, which I easily unfastened. In another minute I was inside the little living-room, looking round for a likely spot on the floor. I went into a tiny shed opening out of the house and found there a collection of ropes and pulleys. These were doubtless used for hauling goods out of the cave below. Two or three lanterns hung on the wall near, and these I found on inspection to be newly trimmed. I had brought one of my own with me, however, and with it a revolver, which I thought might prove equally useful.

A careful inspection of the floor showed me a mark on the stones close to the earth where a crowbar had been used. Mother Trethewy's crowbar still stood in its corner. I laid hold of it and inserted the point at the spot indicated. The flag came up easily enough, revealing a dark cavern underneath. Turning the light of my lantern over this, I saw a flight of steps, apparently cut out of the rock, leading downwards. The air came up through the cavity, cold and damp.

I was fairly in for it now, and I dropped through the hatchway and went cautiously down the steps. The lantern, strapped to my waist, threw its dim light on shiny, damp walls, through which the brine was oozing. I counted the steps until they numbered fifty-two. Then came a passage, the floor of which sloped away at a rather quick rate. This, too, had been excavated through a soft bed of rock. It continued for nearly twenty yards, and then opened into a cave which I at once saw to be of natural formation. Standing in the middle of this, I tried in

vain to get an idea of its height. It towered above my head so much that I could not see the roof. The floor at my feet, however, seemed trodden into a path, and following this, I came to another passage, some fifteen yards in length, which finally emerged in a second cave, evidently of greater extent than the first. As I stepped into this, the faint booming of the sea met my ears. It was into this cave, then, that the entrance from the beach must lead.

I freshened the wick of my lantern and began to examine the cave carefully. I had been right in my conjecture—the Nanjulians' stores were accumulated here. The nooks and crannies were packed with them. Casks, bales, tubs, boxes, were piled one on another, carefully assorted and arranged. One corner sent forth a smell of spirits, another of tobacco. There must have been many a boat-load in that cave. Here and there I found goods literally rotting with old age and mould. Bales of foreign goods, silks, cloths, the contents green with mould, lay thrown about in prodigal confusion. I noticed, however, that in the dryer part of the cave, where the spirits and tobacco were stowed, there had been good care taken to preserve the stock.

Round and round and in and about that cave I went for nearly an hour examining and calculating. There would be a rich haul for us when we made the seizure. I should certainly get promoted and rewarded too. I began to build castles in the air. I would marry Bertha Penraddock, and live in a little house which I had taken a great fancy for. We—

'Stand!' cried a voice, so close to me that I felt the man's hot breath on my cheek. I paused on the instant, and looking through the gloom, saw right before me the evil face of Pharaoh Nanjulian. He stood immediately opposite me, not two yards away, his right hand raised, and pointing a revolver full at my head. There was murder in his eyes; and a great wave came up in my heart as I realised how entirely I was at his mercy.

'If so be as you move a finger, co'sguard, I fire,' said Pharaoh Nanjulian. 'Move you back agin that wall.'

I obeyed, hardly knowing what I did. He followed me, keeping the pistol upon me, until he could touch me. 'Give me the lantern.' He took it out of my hand, and set it on the floor at his side, never turning eye or hand as he did so. The barrel of the pistol looked straight into my face, and the hand that held it never trembled or flinched.

'Now,' said Pharaoh, 'I'll make so bold as to tell 'ee, Master Walsh, what I think. You're acquainted with our little hiding-place, it seems. But wun't go out of un; no, not unless I like. What say 'ee to a bargain, co'sguard? Do you promise faithful to gi' up courtin' my girl and not to say nothing about the cave, and you shall have your life? Don't waste no time in thinking 'bout it, co'sguard. If you say "No," then I shoots, and your brains goes spatter agin the rock.'

Staring straight beyond him, my eyes saw a strange sight. A face, white, startled, full of excitement, came out of the gloom—the face of the boy, Nick Perran. He stole softly up behind Pharaoh Nanjulian, his naked feet making no

sound on the dry sand. His eyes stared straight at Pharaoh's head; his hands clutched Mother Trethewy's crowbar. He swung it up noiselessly for the blow—one, two, three—

'Don't waste no time, co'sguard,' said Pharaoh.

Crash! Bang! The great crowbar came down, and at the same instant the pistol exploded with a voice that woke a thousand horrible echoes. The bullet whizzed past my ear and flattened itself against the rock behind.

'Ah! ah! ah!' screamed Nick Perran, almost frantic in his excitement. 'Quick, Master Walsh, and bind him up. Quick, before he comes to his senses.'

But there was small fear of Pharaoh Nanjulian coming to his senses just then. The crowbar had knocked all his wits out of him. Nevertheless, we secured his hands and feet, and having made his head comfortable, hastened out of the cave as fast as possible. On the way to Porthlock, Nick told me how he chanced to come up at the nick of time. Going along the headlands close to the town, he met Pharaoh, and seeing that he was making for the cottage, followed him at a safe distance. Looking in at the window, he saw Pharaoh descend into the cave. Then Nick saw possible danger for me, and made after the smuggler.

Well, I got a big force together that day and made a seizure, Pharaoh Nanjulian included. The other Nanjulians got wind of what had happened as they came in at night, and made off, nor were they seen at Porthlock again for many a day. I got my promotion, and married Bertha; and we both attributed our great happiness, first, to the camera-obscura, from which I got the important clue; and second, to Nick Perran, who saved my life.

SENTRY-GO!

THE foregoing is the cry that authoritatively rings out every two hours from the sentry's post on all military guards, informing the occupants of the guardroom and vicinity in general, and the next man for sentry in particular, that the hour has arrived for relieving sentries.

Military guards are of twenty-four hours' duration, the men mounting guard at ten A.M., and remaining on till relieved at the same hour on the next day. Guards relieve each other thus: on the approach of the new guard, the sentry outside the guardroom door calls, 'Guard, turn out!' at which summons the old guard hurry out and fall in, with shouldered arms. The new guard is formed up facing them, and compliments are exchanged by the guards presenting arms to each other. The new guard is then numbered and told off by its commander, three men being allowed for each post of sentry duty, and numbered one, two, and three, in which order they are taken for duty. This allows each man four hours between every two hours on sentry.

When all the sentries are changed, and the guard premises duly handed over to the new commander, the old guard march away to their quarters, receiving the parting compliment of a 'present' from their comrades in arms; and the latter are then dismissed to the guardroom. When off sentry, the men sit about in the guard-

house—or outside, if the weather be fine—smoking, reading, or spinning yarns to each other.

During the time they are on duty, guards are visited by officers of different standing, termed 'Grand rounds' and 'Visiting rounds.' The latter is a duty performed by a regimental officer, whose instructions are, to visit the barrack guard once by day and once by night. At his approach, the sentry turns the guard out, and the men stand with shouldered arms for inspection, the commander of the guard reporting if correct or otherwise, after which the men are dismissed. The officer also examines the sentries, to see if they are well informed as to the orders of their posts.

'Grand rounds' is a duty performed by field-officers, taken in turn from the majors and lieutenant-colonels of the garrison. A little more ceremony appertains to these visits, the guard presenting arms on the approach of the officer. At night, there is usually a countersign, which has to be correctly given before the officer is permitted to approach the guard; and ludicrous scenes occur sometimes in consequence of the visiting officer having allowed the countersign to slip his memory.

On some guards—at large convict establishments, for example—the orders for sentries in reference to the countersign are very strict. They are to allow no one to come within a certain distance, unless the countersign is given up; and if it cannot be elicited who the wanderer may be, the guard is to be at once alarmed. On these duties, each sentry is furnished with ball-ammunition, in case of emergency. There is a chain of sentries around such buildings as convict prisons, magazines, &c., and during the night the word is passed from one to the other, in a loud voice, 'Twelve o'clock, and all's well;' and so on at the expiration of every hour.

All sentries challenge persons approaching their posts after ten p.m., the ordinary form, when there is no countersign, being, 'Halt! who comes there?' to which the individual challenged replies, or should reply, 'Friend.' The sentry then says, 'Pass, friend;' and when he sees that everything is correct, 'All's well.'

Certain compliments have to be paid by guards and sentries, in accordance with regulation. When any officer below the rank of major—or the corresponding rank in the navy—passes his post, the sentry stands at 'attention,' with shouldered arms; to majors and officers of higher rank, he will present arms. To the officer commanding a regiment or detachment, the barrack guard is turned out once a day, and all guards turn out to general officers in uniform. On the approach of an armed party, the sentry turns out the guard, who stand at the 'present' if it is a battalion of infantry or similar body of troops; with shouldered arms to companies and other small parties.

To all members of the royal family, arms are presented, much amusement and wonder often being caused to the uninitiated by the sight of a sentry performing some mystic evolution of his rifle to a child in a perambulator or go-cart.

Officers of any recognised foreign service are paid the compliments prescribed for those of the British services. No compliments are paid after 'retreat' has sounded—at sunset—except that the guard turns out to armed parties and to visiting officers.

Prisoners are confined in guardrooms when drunk or riotous, awaiting trial, &c., the commander of the guard and the sentry on the guardroom door being responsible for their safe custody. In the event of a prisoner making his escape, the non-commissioned officer and men responsible are tried by court-martial, and severely punished for the neglect of duty.

In addition to the greatcoat and cape which are issued to every soldier, and invariably taken on guard, 'watchcoats' are provided for the use of sentries during the cold season. The sentry-box is for the shelter of the sentry during inclement weather, but often proves a poor protection in a violent storm, especially if it be beating in the direction of the opening. In thunder-storms, sentries may remove their bayonets, or other parts of their arms and equipment likely to attract the lightning.

To sleep on his post is a serious offence for a sentry, and when men are detected in this irregularity, they are usually severely punished.

Guard-mounting parade is the strictest inspection parade of the day. The dress worn is generally 'marching-order;' and the guards are inspected by the adjutant and sergeant-major, who minutely examine every detail of the clothing and equipment of the men going on guard.

Guard-duty is done in turn, by a roster—that is, a military register—throughout each regiment, and, to encourage cleanliness, it is customary in many corps to detail one man more than is required. When the inspection is taking place, the adjutant notices the man whose general turn-out is the cleanest, and this man does not go on guard, but returns to his quarters, gets rid of his rifle and equipment, and is employed at one of the regimental offices as an orderly, till guard-mounting hour on the following day. Instead of patrolling a sentry's post, he gets his 'night-in-bed,' and a guard is marked to him as though he had actually performed it. Tommy Atkins terms this 'getting the stick,' as the orderlies are equipped with a stick or cane in place of a rifle.

On the day of dismounting guard, the men perform no further parade or duty, finding for a few hours plenty of occupation in thoroughly cleaning straps and accoutrements, especially if they have been favoured with wet weather.

P E A C E.

THE wandering winds are silent on the sea,
That sleeps in sunlight, smiling in its sleep:
No wavelet stirs the bosom of the Deep:
No cloudlet mars the blue immensity;
And yet anon the storm will hither haste,
And lash to wrath with mighty arm the main,
And dash the azure black with wintry rain,
And wildly rave across the watery waste.
There is no staying peace in outward things,
Yet through them ever moves the moulding Will,
From silence into silence touching still
The lyre of Nature with its twanging strings.
Thou art a part of the eternal whole;
Live thou true life in restfulness of soul.

IN WILD SPAIN.

THE epithet in the above title bears no reflection upon human nature in the Iberian Peninsula, but refers solely to the uncultivated as distinct from the cultivated portions of its territory—what Shakespeare calls the ‘high wild hills and rough uneven ways.’ The joint authors of the book which suggests this paper (*Wild Spain*, by Messrs Chapman and Buck. London: Gurney and Jackson) have for more than twenty years undertaken numerous sporting expeditions into various parts of Spain—chiefly in Andalucia. They are naturalists as well as sportsmen; and the long experience they have had of España Agreste gives that touch of verisimilitude to their word-pictures which nothing but long and skilful personal observation can secure.

It is not every one who could afford to follow after wild sport in Spain, as Messrs Chapman and Buck have done. It requires so much that only a comparatively few people have; especially a long purse, and almost unlimited leisure. To visit Andalucia, for instance, for purposes of sport, horses are required, as in the wild land of that district there are no roads, no rails, no bridges, and riding is the sportsman's only available means of locomotion. The occasional village inn is his only place of shelter, and these are sometimes few and far between. A ride through the wilder regions, we are told, and especially among the sierras, involves an amount of forethought and provision that are well-nigh incredible. ‘In the open country no one lives, and nothing can be obtained; or, at least, it is unsafe to rely on it for anything. Thus one is obliged to carry from the town all the necessaries of life. . . . First there is provend for the beasts; heavy sacks of grain, straw, &c., necessitating mules to carry them, and this, in turn, nearly doubling the quantity. Thus an expedition of a fortnight or so signifies nothing less than the transport of huge mule-loads of impedimenta, the most bulky of which are for the use of the beasts themselves; though the indispensables for

the riders are considerable—bread, meat, eggs and oranges, skins of wine, and, in most cases, tents with all the paraphernalia of camp-outfit, cooking apparatus, and the rest.’

All this of course means the employment of a small army of attendants, mule-drivers, and the like. And even then, progress is sometimes slow and not very certain; the pocket compass, or instinct, or a doubtful guide, being in general the only means of finding one's way to where sport is expected. And seldom, moreover, does a ride through the wilder portions of Spain pass without incident. Thus, once our two sportsmen were carried off as prisoners by the Civil Guard, and taken forty miles for the purpose of identification. Sometimes, also, they have to do with the fraternity who live by robbery and spoliation. At another time it may be a wild bull that disputes the way, when a well-directed bullet or two generally ends the strife; or, as a warning of what may be in store for himself, the sportsman may come upon the body of a murdered man. ‘On all the by-ways of Spain, and along the bridle-paths of the sierras, one sees little memorial tablets or rude wooden crosses, bearing silent witness to such deeds of violence.’ All this, however, is not without its humorous side, for our two sportsmen and their long cavalcade were occasionally themselves taken to be a gang of brigands, their sudden ‘appearance striking dire dismay in the breasts of peaceful peasants and muleteers; and on two occasions, again, on entering villages, they were hailed as a strolling company of acrobats. “Here come the mountebanks!” sung out the ragged urchins of the plaza, as our cavalcade with its tent-poles, camp-gear, and, to them, foreign-looking baggage, filed up the narrow street.’

But towns and even villages are seldom met with in the sierras, and scattered cottages hardly ever. The herdsmen and other peasantry gather together, as a rule, into villages, as it would not be regarded safe to have their houses in lonely and distant places, as our shepherds have in this country. Many of the poorer classes, however,

live by charcoal burning, and the blue smoke curling upwards is always to the traveller a sure landmark of human existence. These have perforce to live in the woods; as also do those who are in charge of the herds of cattle which are pastured in the more distant forests; their poor huts consisting of walls of undressed stones, thatched with reeds. 'By day and night the herdsman guards his cattle or goats, often having to sleep on the hill, or under the scant shelter of a lentisco, for which he receives about eightpence a day, with an allowance of bread, oil, salt, and vinegar. His wife and children of course share his lonely lot, their only touch with the outer world being a chance visit, once or twice a year, to their native village.'

To sportsmen or naturalists out all day among the dry scrubby wastes of the sierras, one pleasant hour to them is their arrival in the evening at some *posada*, or village inn, where, after supper, comes the song and the dance, and all the gaiety so characteristic of the Spanish peasant. Here is a pretty little episode. Our two sportsmen had been living above the snow-line of the mountains, for ten days, hunting the ibex, and had returned at length to the comparative comforts of the *posada*. Supper over: 'Now all we need is a song from the Murillo-faced little girl who is fanning the charcoal embers. "Sing us a couplet, Dolores, to welcome us back from the snows of Alpujarras!"

'*Dolores*: With the greatest pleasure, Caballero, if José will play the guitar. No one plays like José, but he is tired, having travelled all day with his mules from Lanjaron.

'*José*: No, señor, not tired, but I have no soul to-night to play. This morning they asked me to bring medicine from the town for Carmen; but when I reached the house she was dead. I find myself very sad.

'*Dolores*: But as she already has her palm and her crown?

'*José*: That is true! Bring the guitar, and I will see if it will quit me of this melancholy.'

We pass over boar-hunting and trouting, as not conveying much that is either striking or new; as also the shooting of the Great Bustard, by driving or stalking. But the manner in which, in winter, the peasantry capture the Great Bustard for food, though not sportsman-like, is picturesque. Two men are required, one of whom carries a gun, the other a *cencerro*, or cattle-bell, and a dark-lantern. 'The pack of bustards will be carefully watched during the afternoon, and not lost sight of when night comes until their sleeping-quarters are ascertained. When quite dark, the tinkling of the *cencerro* will be heard, and a ray of light will surround the devoted bustards, charming or frightening them—whichever it may be—into still-life. 'As the familiar sound of the cattle-bell becomes louder and nearer, the ray of light brighter and brighter, and the surrounding darkness more intense, the bustards are too charmed, or too dazed, to fly. Then comes the report, and a charge of heavy shot works havoc among them. As bands of bustards are numerous, this poaching plan might be carried out night after night; but, luckily, the bustards will not stand the same experience twice. On a second attempt being made, they are off as soon as they see the light approaching.'

These bustards are very large and heavy birds, three of them, which on one occasion fell to the gun of one of our sportsmen, weighing together ninety-three pounds.

To naturalists, even more than to sportsmen, the chapters descriptive of the animal life of the marisma, and of the wonderful swamps which compose that immense marshland, will appeal strongly. The marisma is the name given to the great level delta of the Guadalquivir, covering some hundreds of square miles. This huge triangular area is described as, in fact, a wilderness, the greater part of which in winter is a dismal waste of waters. 'For league after league, as one advances into that forbidding desolation, the eye rests on nothing but water—tawny waters meeting the sky all round the horizon.' The marisma is intersected by the Guadalquivir and its various branches and channels. In winter these marshy plains are the haunts of abundant wild-fowl—ducks, geese, and water-birds of various kinds; but it is the spring months that are of most interest to the naturalist. 'Imagination can hardly picture, nor Nature provide, a region more congenial to the tastes of wild aquatic birds than these huge savannahs, cane-brake and stagnant waters, and their profusion of plant and insect-life. Here, in spring, is an ornithological Eden.'

'One cannot go far into the marisma without seeing that extraordinary fowl the Flamingo, certainly the most characteristic denizen of the wilderness. In herds of three to five hundred, several of which herds are often in sight at once, they stand like regiments, feeding in the open water, all heads under, greedily tearing up the grasses and water-plants that grow beneath the surface. On approaching them, which can only be done with extreme caution, their silence is first broken by the sentries, which commence walking away with low croaks; then the whole five hundred necks rise at once to full stretch, every bird gagging his loudest as they walk obliquely away, looking back over their shoulders as though to take stock of the extent of the danger. Shoving the punt a few yards forward, up they all rise, and a more beautiful sight cannot be imagined than the simultaneous spreading of their thousand crimson wings, flashing against the sky like a gleam of rosy light. Then one descends to the practical, and a volley of slugs cuts a line through their phalanx.' Some of these beautiful birds, with their very long legs and long necks, stand as high as six and a half and seven feet.

Equally graphic and interesting are the descriptions we have of other birds that haunt the marisma, the lake and lagoon—Avocets and Stilts, Storks and Herons, Egrets and Spoonbills, and scores of others—but these we must pass over. One very remarkable fact, however, and one we should think very little known, is, that there are actually a herd of wild Camels existing in the marisma. The statement that there are wild camels in Europe does at first hearing sound strange; but such is the fact, and this is how it came about, as is explained in a book published at Seville in 1869:

About the year 1830, a number of camels were brought to the south of Spain from the Canary Islands, and in a few years increased to a herd

of about eighty. In 1833 they were used as beasts of burden and transport in the province of Cadiz, employed in the carriage of materials used in making the high-road from Port St Mary to San Lucar de Barrameda, and also in conveyances to Arcos, Jerez, Chichlana, and other towns. But horses were frightened at the strange animals, and could on no account be got to work with them, or even live in the same yard with them; and so the camels fell into disuse as beasts of burden and carriage. They were then tried in agricultural work, but with no better success. The result, in short, was that they were allowed to occupy the marisma, and have wandered there for nearly a quarter of a century. It is difficult, however, getting nearer to them on these level marshes than within a mile or so, as they are extremely wild and shy, and fly off at the first suspicion of the approach of a human being.

When first Mr Chapman, about nine years ago, announced through the press his having seen these wild camels, it was in some quarters promptly questioned. But time has proved the fact. And our two sportsmen have fallen in with them on several subsequent occasions. On January 6th, 1888, they descried a herd of nineteen, of various sizes, all dreamily ruminating, knee-deep in the marisma, each form reflected in the still water beneath. The herd remained for half an hour in sight, and by the help of field-glasses were brought very close and well seen. 'Presently they moved on to a rushy islet, some three miles from shore; hard by stood a rosy troop of flamingoes, and the intervening waters were dotted with numberless flocks of ducks and geese. It was a unique spectacle, one that could hardly be matched outside this out-of-the-world corner of Europe.'

With regard to another animal closely associated with Spain—namely, the Bull—we have here also some characteristically fresh information. Most people in this country no doubt will fancy that any sort of bull is good enough to put in the arena, to be teased into rage, and then killed. This, however, is not so. The bulls used for fighting purposes are a specially selected and specially cared-for class. They are all pedigreed. Andalusia is especially the district of the bull. Here, at the age of one year, the young bulls are separated from the heifers, branded with the owner's mark, and turned out loose on the plains to graze with others of their own age and sex. When a year older, the young bulls are gathered together, in order that their mettle and fighting qualities may be tested. One of them is separated from the herd, and chased by a man on horseback, who, by the skillful use of a blunted lance, overthrows the escaping bull, whereupon another rider comes in front of the animal with a sharper lance, to withstand the expected attack. If the bull on regaining its feet attacks the rider twice, it is passed as a fighting animal; but if it turns tail and runs off, then it is set aside to be killed, or to be used in agricultural work. And so with each animal until the whole herd of two-year-olds have been tested. Each bull that has stood the test successfully is then entered in the herd-book, with a description of its appearance, and receives a name—such as *Espartero*, *Hamenco*, and the like. This process of careful selection goes on from year to

year till the bull is five years old, when, should its mettle still prove true, it is ready for the arena, and flaming posters appear on the walls of Madrid or Seville announcing that *Espartero* (or whatever its name is) will on such and such a date make its first and final appearance. A good 'warrantable' five-year-old bull for the fighting ring costs from seventy to eighty pounds sterling.

This book is a specially attractive one, and it would be easy to dwell much longer over its pages. The stories of the haunts and habits of eagles and vultures, of the lammergeyer, of the ibex, the lynx, the wild-cat, the red deer—all these are tempting; but we can only commend the reader curious on these subjects to survey the pages for himself.

POMONA.*

CHAPTER IX.

When to the sessions of sweet, silent thought
I summon up remembrance of things past,
I sigh the lack of many a thing I sought,
And with old woes new wail my dear time's waste.

SHAKESPEARE.

CHRISTMAS Eve, with nature trying its hardest to chill and discourage the cheerfulness and good feeling that, even in these cynical days, bubble up in the very midst of poverty and sickness and want of employment. A frosty fog brooded over London, through which the gas lamps winked dejectedly at mid-day without doing anything but make the darkness surrounding them more apparent.

In Dr Merridew's house the Egyptian darkness that could be felt would not have checked the Christmas rejoicings and preparations. There is such a lot to be done on Christmas Eve: such doing-up of parcels, such directing of Christmas cards, such dashing out into the fog to get sealing-wax or string or a card for some one forgotten in the first reckoning; such elaborate decorations of the shabby, little dining-room with lop-sided wreaths and garlands, that came floundering down if the door were shut forcibly, which occurred once in ten minutes.

It was also necessary to make constant visits of inspection into the kitchen, where a goose, which had arrived from Scar the day before, was being picked and prepared for next day's dinner. Such a splendid goose, too, which the children tried hard to identify with one of the stately flocks on the pond at the farm, who, when they happened to be on land, filled Kitty's soul with fear, as she passed, with their long necks and loud hissing.

It had come in a big basket, with apples and a jar of cream and a couple of lobsters and some walnuts and a cake—just what a Christmas hamper should be, they all agreed.

Sage was not so demonstrative in her pleasure at its arrival. She was a little bit dull altogether that Christmas Eve; the boys more than once suspected her of being cross, only she was more open to what they considered reason than usual, and gave in to sudden demands for advances of pocket-money with an amiability that was above suspicion.

Father pretended to suspect biliousness, and really watched her surreptitiously, as he had done a good many times since her return from Scar. Fathers are not generally very observant about daughters' feelings; but Dr Merridew was fidgeted by the feeling that there was a change in Sage which he could not account for. The two months at Scar seemed to have been all that was delightful—the whole party agreed in that; and Sage was up in arms if anything was said against the place. Dr Merridew, in that unreasonable way parents have, regarded Sage as still quite a little girl in respect to love affairs; but it did at last dawn on him that this might be a possible explanation of the change in her.

Could it be this artist fellow, of whom all the boys and Kitty were so full? He paid more attention than was usually his habit to the children's descriptions, but could not gather much information, so he tried to sound Kitty on the subject.

'Kit.'

'Yes, father.'

'What was that Mr What's-his-name like, down at Scar?'

'Who?'

'Why, the artist who painted you. Queer sort of artist he must have been to paint my ugly duck!—Now, Kitty, if you behave so disrespectfully to your paternal relative, I shall order a dose of Gregory's powder every night for a week.'

'If you mean Mr Ludlow,' Kitty said disdainfully, 'I can tell you that he is the greatest painter in England by far, and his picture will be the best in the Academy.'

'Number 269,' murmured Dr Merridew—'An ugly Duck.—Kitty, leave my whiskers alone.—Well? What was this Mr Ludlow like? Was he old?'

'Yes.'

'Very old?'

'Yes.'

'As old as me?'

'Nearly, I should say.'

'Thank you, Kitty. Was he as decrepit as your aged parent?'

'Oh no; of course he was not so very old as that, only pretty oldish.'

'Was he good-looking?'

'Oh no; he had gray hair.'

'Bald?'

'No.'

'Stout?'

'No. Oh, I don't know what he was like exactly—just like most oldish people. You know what I mean.'

'Did Sage like him?'

'Oh yes; awfully.'

'Did he like her?'

'Oh, I suppose so; he liked us all.—But I'll tell you who *did* like Sage awfully.' Kitty's voice sank to a mysterious whisper, and Dr Merridew pricked up his ears, thinking, 'Oho! now we're coming to it.'

'And who was that?'

Kitty held father's head firmly with her two hands, and put her lips close to his ear, breathing into it with the usual tickling sensation, 'Maurice Moore.'

'Oh-h-h!' a long whistle of disappointment

from Dr Merridew. 'Is that all? Why, he was the one-eyed man who took you out lobster-catching.' Which shows the chaotic effect produced by the very partial attention Dr Merridew bestowed on the children's narrations.

'Father!'—reproachfully—'I've told you hundreds of times that was Lot. And he wasn't one-eyed either, only one eye was always rather screwed up.'

But just then the surgery bell rang, and Dr Merridew never got any further, being left with the prevailing idea that this Maurice Moore, who liked Sage awfully, was one of the Scar fishermen, even though he might not be the one-eyed lobster catcher.

'I am not ungrateful,' Sage was telling herself; 'I don't mean to be ungrateful; but I don't think Christmas is merry after one is grown up. Of course, one can be happy and quite contented and grateful, but not merry. I don't think one need feel one is wicked because one can't be merry.'

And then she watched with wonder—and perhaps a very slight mixture of contempt was in the wonder, but very little, for she loved and honoured him, and made a hero of him still—father romping with Kitty as if he had not known years of trouble and wearing anxiety, and had not buried his love years ago.

She had painted a little Christmas card to send to Mr Ludlow, taken from a small sketch of hers of Scar Head with a sunset sky behind it; and when it was done, something she had meant for a bush thrown up against the orange sky, took so curious a likeness to a human figure coming, as some one had seemed to come one September evening, straight out of the sunset, that she could not bring herself to part with it, partly on her own account, and partly because she feared that Mr Ludlow might see the resemblance, and remember that evening.

She went up now and then, when the merriness of Christmas became too oppressive, to have a look at the little picture, which she had put inside the cover of her Bible. She was afraid Owen Ludlow might think it unkind of his friend to send no greeting to him at Christmas. Kitty and the boys, with much discussion and consideration, had chosen cards which they considered appropriate for the painter; but Sage could not make up her mind to send him anything but the sketch of Scar Head, and that she could not bring herself to part with, even though by so doing she might appear neglectful of her friend.

Ludlow had written to her several times; and Dr Merridew, with his suspicions not quite allayed by Kitty's assurances of the age and uninterestingness of the painter, had read the letters with interest and a little wonder. Not being himself a man who could make a friend of a girl, and having a constant tendency to depreciate his own belongings, he found it hard to believe that his little girl, Sage, could inspire such a dignified emotion as friendship.

Sage had answered the letter; but I do not think quite so satisfactorily as she might have done but for that final fortnight at Scar. I do not fancy friendship and love can reign side by side in one heart unless it be a very large one.

Dr Merridew was late in coming in to supper

that Christmas Eve; and as the usual hours of going to bed were set aside to-night, the children were all waiting for him with much impatience. I firmly believe that Kitty had gone to sleep on the hearthrug with her head resting against Sage's knee, or else why should the goose prepared for to-morrow's dinner have suddenly joined the party by the fire and spread out a webbed foot to the blaze; but it was prevented from further demonstrations by unmistakable sounds of Dr Merridew's return, and discreetly retired to its place in the larder, while Kitty jumped up, tossing the hair out of her eyes, and forgetting all about the strange incident that had just occurred.

'Here he is! Hooray!'

'Tell Sarah to hurry up the pie.'

'Don't let him go up to wash his hands, Kitty. Make him come straight in. Hands always are dirty at Christmas. Just look at mine, they're beastly; but'—

A silence of consternation fell on the family, for further delay seemed impending. A haughty rattled up to the door, and pulled up noisily at the curb; and they heard the doors flung open and a man's voice talking to Dr Merridew on the doorstep. Cabs were not frequent at the doctor's door, and when they came, they invariably meant a patient in a desperate hurry who had sent to fetch the doctor.

'It really is too bad,' they all agreed; and then they gave a sigh of relief, for they heard father's latchkey in the door, and the cab drive off; so they knew that Dr Merridew had not been carried off from his anxious and hungry family and from that much-enduring steak pie.

Kitty was starting to meet him, and prevent any unnecessary ablutions, when voices in the passage made her pause again.

'There's some one come in with him, and they'll go into the surgery and stop hours and hours!'

But again they were wrong in their dark forebodings, for Dr Merridew did not pass on to the surgery, but stopped at the dining-room door; and, as he turned the handle, they heard him say, 'Come in, come in; you'll find all the youngsters here.' And then the door opened, and father came in, ushering in Owen Ludlow.

CHAPTER X.

Why else was the pause prolonged, but that singing might issue thence?

Why rushed the discords in, but that harmony should be prized?

BROWNING.

'You see,' Mr Ludlow said, with a helping of the steak pie before him, 'my old friend Collins—you know who I mean?—the man I was with so long out in California—has gone off for the winter to Italy. He wanted me to go with him; but I've grown old and lazy, and not to be roused up to go a-gadding even to Italy. So, when he found I wouldn't come, he said I could have the use of his house while he was away, free, gratis, for nothing, a jolly little house up in Regent's Park, with a studio fit for a king. I didn't think much of his offer at first; but a day or two ago it dawned on my mind that it would be pleasant to come up and see my friends for a bit at Christmas.'

'Very pleased to see you,' Dr Merridew said. 'I've had it on my mind ever since the children came home, that I've never thanked you for your kindness to them at Scar.'

'Oh, I assure you it was no kindness on my part.—We had a jolly good time, didn't we, boys? and Sage and Kitty were the most long-suffering of models. You know that I painted them into my picture, didn't you, sir? You must come and have a look at them and my Pomona. Yes; I brought her up with me, and endured mental torments all the way, from the conviction that she was ruined and done for through the outrageous violence of the porters. But there was not a scratch or a rub on her when I unpacked her; indeed, I think she had improved during the two days she was shut away from my sight. You must give me your opinion of her. I've got her in exactly right light. She won't look half so well in the Academy.'

Dr Merridew and Mr Ludlow got on famously, much to Sage's relief. Sage herself was very quiet, and the painter fancied she was a little pale, and that there were some patient lines about her mouth that were not there when he painted her at Scar. The beauty that had flashed out so untimely when Maurice was present had died away again, he noticed; but he had never cared for it or dwelt on it with satisfaction, and he was glad to find his quiet, little friend again with her only charm, the soft, sympathetic eyes, that seemed so transparent you could almost see the pure young soul within.

Before Mr Ludlow went, he made Sage and the children promise to come up and see him to-morrow, or rather to-day, for it was Christmas morning by that time. He wanted them to come and dine; but when he heard of the Scar goose, he understood the impossibility of such a proceeding; and so it was arranged that he should come and have a share of that wonderful bird, and afterwards conduct the whole party up to Regent's Park to spend the rest of the day.

This being settled, Ludlow took his departure, and the children went up to bed, and Sage sat down with her father in the little sitting-room.

The appearance of the painter had rather shaken Dr Merridew's faith in Sage's feelings of friendship. Owen Ludlow was a decidedly younger-looking man than the one Dr Merridew saw in the glass when he shaved; but then he had not had the cares of a family and a very uphill practice to take the youthfulness out of him. It was difficult to realise that to Kitty's eyes Owen Ludlow looked an old man, and even to Sage decidedly middle-aged; and though women are generally supposed to be more impressed by dress than men, Dr Merridew was much more carried away by Mr Ludlow's splendid fur-lined coat than either Sage or Kitty.

But his doubts were reassured by Sage's undisguised pleasure and entire want of embarrassment; and also he noticed that even when Mr Ludlow was present, and the children were chattering, and Owen taking his full share in the fun and nonsense, Sage still had that plaintive, little, far-away look, as if her thoughts were not always occupied with what was going on before her.

'It must be the one-eyed man who caught

lobsters, after all,' was the only conclusion Dr Merridew could arrive at.

Next day was all that Christmas Day should be—frosty and bright, without any of the fog that in these degenerate days so often accompanies frost. The goose for dinner began to emit savoury odours at an abnormally early hour, and yet was only just done to a turn when dinner-time came, and Owen Ludlow with it.

He had brought a present for Dr Merridew; but he said the others must wait for theirs till after Christmas, as he had not had time to get them; and he was not sure what they would like; so they must come out with him one day and choose for themselves.

'But I have something for you at home, Sage,' he said, with a strange look at her, which made the blood rush up into her pale, little face, and her heart flutter in an odd, tiresome way.

'No; I'm not going to say what it is,' he said in answer to Kitty's whispered inquiry as to whether it was a picture; and Sage felt sure it was one of the many sketches of Maurice Moore that lay about in the studio at Scar—Maurice in all sorts of easy, out-of-the-way, graceful attitudes. She resolved instantaneously in what place of honour it should hang, where she could see it from her bed, where the morning sun would fall full on it, over the chest of drawers, on the top of which were her few books and treasured little nicknacks. How good of Mr Ludlow to think of giving her that, and how strange that it should have occurred to him when, of course, he could not have the least idea that it was the one thing in the world she would value most!

His present to Dr Merridew was that picture of Kitty of which mention has been made, sitting on the boat with a group of the men on the shingle below; and it was 'framed beautiful,' the servants said, when they were brought in to look at it, evidently considering the frame the principal part of it.

Dr Merridew was very much pleased with it, and so was Kitty, who had always rather resented the fact that a photograph of Sage was the only picture in his room; and a very ugly photograph, too, with very staring eyes and large hands and hair done in a pigtail.

The goose, they all agreed, was perfection; and so was the plum-pudding; and though an ominous little tinkle from the surgery bell caused anger and consternation to appear on most of the countenances round the table, it turned out to be only a young woman with the toothache, which was dealt with summarily; and Dr Merridew came back, with a whiff of creosote hanging about him, to finish his pudding.

And then, without paying half the usual and proper attention to the oranges and chestnuts which usually occupied all Christmas afternoon till the tea-tray appeared, Owen Ludlow carried them off, one and all, for the rest of the day to Regent's Park. I am ashamed to say I do not know what is the best way from Dalston to Regent's Park; but my better-informed reader will be sure to know, and will be able to trace the party by omnibus, train, or underground railway, as they wended their way to Mr Ludlow's quarters.

Christmas daylight is short; and by the time they reached Regent's Park, darkness had come,

with great frosty stars up above, and twinkling rows of gas-lights below.

'Here we are!' said the painter, as they stopped at a gate leading into a garden surrounding a detached white house. The hall was lighted by a hanging lantern brought from Damascus, of softly tinted glass; and at the foot of the staircase was waiting a kindly old housekeeper to show the two girls up-stairs to take off their hats. There were such lovely thick carpets on the broad shallow stairs that Kitty could not resist treading it as a cat does in moments of great content with a movement of the paws as if she were kneading.

Kitty was impatient to join the rest of the party down-stairs, being afraid that father would be shown the picture of Pomona without her being there to point out the chief points of interest; so she left Sage, who was more leisurely in her movements, and ran down without her; and when Sage was ready, she found that the attendant housekeeper had also disappeared, and she must find her way down by herself. From the hall a passage led off to what she concluded was the studio; but on either side were other doors, and one of these stood a little open, and showed a light within; and Sage, with a sudden hope that perhaps her picture might be there, and that she might get a sight of it without others standing by, went in.

Some one was standing by the fire, and, seeing this, Sage would have withdrawn, had not that some one turned with an exclamation of great pleasure, and come towards her with both hands outstretched in eager welcome.

He had held her hand last in the moonlight on Scar Cliff. It was Maurice Moore.

(To be continued.)

THE SILVER QUESTION.

A SPECIAL session of the Congress of the United States has been summoned to consider a subject which is agitating all the civilised nations of the world, and which is generally called the Silver Question. With the deliberations and contentions of the American legislature we shall not concern ourselves here; but we propose to explain briefly, and as simply as the complexities of the matter will allow, how it is that the Silver Question has reached a crisis in the great Western Republic, and has produced a continuous crop of commercial disasters, almost unprecedented in number and extent, in the course of the present year.

In former articles,* we have explained the theory of Bimetallism and the origin and meaning of the Pound Sterling, and we will assume our readers, therefore, to be in possession of the elementary facts. The agitation for Bimetallism, it may be recalled, arose chiefly in consequence of Germany having demonetised silver, after the close of the Franco-German war, and of the United States having resumed specie payments in 1879.

We must, however, go back to the year 1878 in order to trace the economic development of the

* 'What is Bimetallism?' April 17, 1886. 'The Pound Sterling,' December 10, 1887.

question. The silver dollar was restored by an Act of Congress of that year, now commonly referred to as the Bland Act, taking its name from the introducer of the Bill. The silver dollar had been the usual currency before the civil war; but the exigencies of that period of storm and stress required the creation of a vast paper currency—greenbacks—which it was the object of the Bland Act to replace by metal. This Act provided that the Government should purchase every month not less than two million dollars' worth (£400,000), and not more than four million dollars' worth (£800,000) of silver bullion, to be coined into dollars.

Now, while this Act compelled the purchase of at least £400,000 worth of silver per month, it did not as is commonly supposed, involve the issue of silver dollars to the same amount. The price of silver varies, and the amount of bullion purchasable for two million dollars was not always the same. Thus, at the time the Bland Act was passed, a paper dollar or greenback (then inconvertible), was not worth its face-value in gold; and therefore the amount of silver purchasable by greenbacks depended both on the gold-price of silver bullion, and on the gold-value of the paper. But when specie payments were resumed at the beginning of 1879, then the Government greenbacks, being redeemable in gold, became the measure of gold-values, and could be used to purchase the silver at the current price of that metal in gold.

Did all the silver coin go into circulation month by month? There was just the difficulty. The Act provided for the issue of silver-certificates against a deposit of silver dollars—in amounts of ten dollars and upwards—and in practice these certificates were found much more convenient than the coins. They were not, like the old greenbacks and the silver dollar itself, absolute legal tender; but as they were receivable in payment of taxes, of customs duties, and of all public dues, they circulated freely. These certificates and the coined dollars formed the silver currency of the Bland Act.

The passing of the Bland Act was in part the result of the commercial depression which followed upon the inflation of 1871-73—in which the low prices were ascribed to the contracted currency—and in part the result of the efforts of the Silver States to find a larger outlet for the product of their mines. It did not establish Bimetallism, and it was a compromise intended to appease all parties, but which ended in satisfying none. It was a novel experiment in economics—to introduce a regular monthly addition to the currency without regard to the quantity of coins already in circulation, or the need of the community for more—and it endured for twelve years, with curious results.

In the first place, the banks did not care for the new silver money, and would not allow it to accumulate in their vaults, for gold

remained, as ever, the basis of credit and of foreign trade. For several years they prohibited the settlement of balances at the Clearing House in New York, and in some other cities, either in silver certificates or in silver dollars. They were obliged, of course, to receive the silver currency when tendered on deposit, or in payment of debts; but they paid it out again as quickly as possible, and turned over both dollars and certificates to the Treasury through brokers and others who had heavy payments to make to the Custom-house and other public departments.

Thus, as fast as the Government coined the silver, it came back again to the Treasury vaults—all but a small proportion retained in circulation for purposes of small change. Professor Taussig of Harvard, an acknowledged authority on American economics, thus describes the operation: 'The employees to whom the silver dollars are paid, get rid of them as fast as they make purchases: the shopkeepers in whose tills they accumulate, finding their customers averse from taking them in change, turn them into the banks on deposit, and the banks finally turn them into the nearest sub-treasury in payment of public dues. The round trip from Treasury back to Treasury is easily made, in some districts in the course of a single week. The degree of favour which they meet of course affects this movement, and varies in different parts of the country, apparently reflecting in a curious way the popular feeling as to the desirability of having silver currency at all. They circulate very little east of the Alleghanies, but are used more freely and permanently in the Mississippi Valley. Among the negroes of the South, big pieces are said to be favourites, and find a permanent lodgment. Their greatest circulation was reached in 1886.'

Coinage under the Bland Act began in March 1878, and practically not one-fifth of the coins went, and remained, among the people. Meanwhile, 'dead' silver was rapidly accumulating in the vaults. In 1880, however, the Treasury stimulated the circulation of certificates by offering to give, in exchange for gold deposited at New York, drafts on the Government offices in the South and West, payable in these certificates. It was an easy and cheap way of remitting for those who had to send money thither, and by the end of 1881 some sixty-two million dollars' worth of silver certificates were in circulation. The abundant crops of 1880-82, the demand for them from Europe, and the subsequent extension of railways, &c., greatly facilitated the operation by causing a greater demand for currency. Thus it was that, down to the end of 1883 or so, the silver trouble was not much felt in America.

With 1884, however, came a reaction, and many disastrous failures of large firms, banks, and railways. The railroad-building mania ceased, loans were called in, credit was shaken, and the circulation of the silver currency shrank rapidly. Once more 'dead' silver accumulated in the Treasury; and by the middle of 1886 some ninety-four millions of dollars were held in the vaults, with no use and no demand for it. As fast as silver was paid into the banks, on deposit

or in the ordinary way of business, it was turned over by them to the Treasury, in the same way as before.

A curious thing in connection with American currency now comes into view. Between 1880 and 1890 there was a considerable increase in the number of silver coins—not certificates—retained in the hands of the public, and yet there was no apparent increase in the circulation of them. How was this? Simply because a large part of the silver coinage is not used as money at all, but is melted down by the jewellers and others. The coined silver is, no doubt, a great deal dearer than bullion silver; but people who want only a small quantity of the metal at a time, in order to produce something the value of which will depend more on the workmanship than on the metal contained in the articles, find it more convenient to melt down the dollars than to buy silver bullion. It is estimated that between fifty and sixty millions of the silver dollars issued have been thus used up in the arts.

We must now pass more rapidly on to 1890, when, by the joint influence of the Bimetallists and the Silver-producing States, was passed what is known as the Sherman Silver Purchase Act. This repealed the Bland Act of 1878, and decreed that the Secretary of the Treasury should every month purchase, at the market-price, four and a half million ounces of silver, paying for it in Treasury notes of from one to one thousand dollars each. These notes are what the old silver certificates were not—except for public dues—direct legal tender for all debts, unless an express contract is made to the contrary. They are also redeemable either in gold or silver, at the option of the Treasury. It was provided that the coinage of silver ordered under the Bland Act should cease on the 1st of July 1891, and that thereafter only as many silver dollars should be coined as might be needed for the redemption of the Treasury notes—which means none, for redemption is always wanted in gold, and has never so far been refused. The Treasury notes issued monthly vary in value according to the market-price of the four and a half million ounces of silver for which they are given. Now, for a short time after the passing of the Sherman Act, silver advanced, and went pretty rapidly up to about 1·20 dollars per ounce. But then came a reaction; and ever since, there has been a steady fall, which has brought about the present crisis. At the close of 1892 the price was only eighty-five cents, and it has since gone much lower.

The tremendous fall in the gold-price of silver, notwithstanding the large monthly purchase of the United States Government, has been puzzling alike to Bimetallists and Monometallists. It seems to be due to the very large increase in the output of the silver mines of the world, not only in America but elsewhere, and to a greater demand for gold for the settlement of international balances. Whether or not the Sherman Act would have succeeded in its purpose of preserving a permanent ratio between gold and silver, had it not been for the great and unexpected decline in silver, need not be here discussed. It has failed, and failed dismally; but it has also served to demonstrate the futility of any nation attempting to establish Bimetallism for itself and without regard to the other nations.

In the first year of the operation of the Sherman Act, there was a considerable addition to the volume of silver currency, due to special causes relating to the Tariff and Treasury disbursements, and this addition was mainly in the form of Treasury notes for the smaller amounts. What helped this circulation was an agreement among the banks to regard these notes as ordinary money, receivable for all purposes, as having a legal-tender quality and a gold basis. But in 1891 was experienced the great depression following upon what is known as the Baring crisis, with a consequent arrest of circulation, and accumulation of paper and silver in the hands of the banks. They resorted to the old practice of sending silver back to the Treasury through the Custom-house, &c.; while every month the Treasury was adding to the stock of notes in want of circulation. The silver purchases must go on, whatever the price, and so, month by month, the trade and commerce of the United States became crushed under the weight of redundant money.

It seems an odd thing to say, that a country can have too much money; but everything depends on the quality of the money. Of small-money, till-money, change-money, for the smaller purposes of daily life, a community needs only a limited supply, and any excess over actual needs must fall into the vaults of the banks or of the Government. Now, money is of no use when buried; it must circulate to be fruitful, and the more the volume of unproductive money increases the greater becomes the burden on the people. In active times of business, more change-money, or let us say pocket-money, is needed; and in dull times less; but the experience of America has proved that you cannot increase the demand for such money by merely increasing the supply.

We have said that the Sherman Act permits the redemption of the Treasury notes—paid for silver—in either gold or silver at the discretion of the Secretary; and we have also referred to these notes as resting on a gold basis. This apparent inconsistency requires explanation. While the Act allows this discretion, it also declares the policy of the United States to be to maintain the two metals on a parity with each other, at such ratio as may be provided by law. This declaration neutralises the discretion, for a refusal of the Treasury to pay any of the notes in gold when demanded, would have the immediate effect of depreciating the notes, and of thereby disturbing the parity between gold and silver. They would, in short, become mere silver certificates negotiable at fluctuating exchanges as the price of silver in terms of gold varied.

At the end of the third year of the operation of the Sherman Act—namely, in July 1893—there had been issued 147,000,000 dollars of these Treasury notes in payment of the purchases of silver bullion which the Act decreed should be made monthly. Only a small fraction of the bullion was actually turned into coin, and while the bulk remained unminted, the most of the Treasury notes given in payment had been presented for payment in gold and had been so paid. In the last year, for instance, 54,000,000 dollars of notes were paid for silver, and 49,000,000 dollars of these notes were redeemed in gold within the year. The Treasury

dare not, for the reasons explained, fall back on its option of paying them in silver; and in consequence the gold reserve which the Government is bound to keep for the redemption of other national obligations, was seriously reduced.

Silver continued to fall until in the present year it reached the lowest point on record. This continuous and serious decline was so menacing to the silver currency of India, and to the industries of the country, that the Indian Government declared they must either adopt Bimetallism—the remedial properties of which are, of course, denied by those who believe only in a single standard—or stop what is called the 'free coinage' of silver, that is, the issue at the mints of rupees for silver bullion, at a fixed rate, in any quantity to any person. Thereupon was appointed a Parliamentary Committee, under the presidency of Lord Herschell, to inquire into the whole circumstances, and to report to Parliament on the plans of the Indian Government. That Committee practically declared in favour of the suspension of free coinage, by admitting their inability to advise the Government to overrule the proposal. Immediately on the publication of the report, the Indian Government closed their mints against further receipts of silver—except in special circumstances, and for the necessary upkeep of the currency—and offered to supply rupees in exchange for gold (not silver) at the rate of one shilling and fourpence per rupee—that is, one-third less than its nominal value in India (two shillings).

We do not propose to deal just now with the tragic story of the 'demoralised rupee,' but return to the dollar. The effect of the decision of the Indian Government was to give a shock to metallic currency all over the world, to send down the price of silver still further—only temporarily, it is contended, as the supply will soon be brought into nicer relations to demand by the closing of unremunerative mines—and to produce a financial panic of an acute and far-reaching kind in the United States. As President Cleveland stated the position in his Message to Congress: 'The knowledge in business circles among our own people, that our Government cannot make its fiat equivalent to intrinsic value, nor keep inferior money on a parity with superior money by its own independent efforts, has resulted in such a lack of confidence at home and instability of currency values, that capital refuses its aid to new enterprises, while millions are actually withdrawn from the channels of trade and commerce, to become idle and unproductive in the hands of timid owners. Foreign investors are equally alert, and not only decline to purchase American securities, but make haste to sacrifice those which they already have.'

Not only was the situation serious, but it was becoming every month more grave, because the supply of silver is increasing, with no present prospect of the maximum of production having been reached. It is almost impossible to exaggerate the economic evils of a depreciated currency; but if these evils press more heavily on one class than on another, it is upon those who earn their bread by the sweat of their brow at labour provided by capital. It is upon the masses of the people of the United States, therefore, that the burden of the 'dead' silver of the Sherman Act

falls, and it is to devise means for lightening or removing the burden that Congress was summoned to a special session after the Indian Government closed their mints—the first design being the repeal of that Act.

THE BURDEN OF ISABEL.*

CHAPTER XL.—IN THE BOSOM OF THE FAMILY.

EARLY that morning, Mr Suffield had received a brief telegram from his wife: 'George back. Broken down.' Suffield at once arranged to go to London; and he arrived there in the evening, travelling third-class; for he accepted his poorer position at once without demur. 'And really,' he said to himself, 'I believe I prefer third—unless I should want to sleep.' When he entered the house at Rutland Gate he went first to the library; and as he glanced round upon the serried portraits of the Lords of Padliham, it was with an absolute sense of relief that he thought he would soon see them no more: he would no longer be afflicted with the sense of their superciliousness. He would go back to his own people, with his own people, and live and die among his own people, performing the duties he had foolishly laid down to take up others for which he had little taste and indifferent aptitude. He was thinking thus hopefully, when his wife entered behind him.

'I have been looking for you, my dear,' said she, approaching to greet him with a kiss. 'Oh my poor, dear George!' she cried. 'My owl lad! What has come to you? You've no colour in your poor cheek, and your hair's as white as it should be at eighty! Oh, my husband! My dear! And has it all worked this change upon you, my poor lad! My poor George! Oh, my dear! And you never told me!'

She kissed him, and wept over him, as a girl might over her soldier-lover, from whom she has long been parted, and who returns wounded and worn. And he stroked her dark hair in silence, and kept as firm a mouth as he could.

'You got my letters, of course?' said Suffield, who had written—with some reserve—to his wife daily during his absence in Lancashire.

'I did.—But what about yesterday, George, my dear? What's the end of it all?' she asked.

'It's all over, my lass,' he answered.

'You mean,' she exclaimed, clasping her hands tightly before her, 'that we are completely ruined?'

'Not altogether that, Joan, my dear,' said he. 'But we must leave this house, and sell or let th' Hall and Park, and we must let Parliament alone, and go back to work.'

'You have not made much of Parliament, have you, my dear owl lad?—so that need not distress us,' she observed with a smile.

'No, lass,' said he; 'I have not. I haven't spoken, I admit. But I've given a good many

votes, and I've set a good example. There's too much talk there already, and too little work.'

'And it's all,' said she, taking little note of what he had said, but sitting down, glancing this way and that, as if to review the whole situation, 'through the recklessness of that boy!'

'Nay, lass; it's our own fault,' said Suffield. 'Don't be too hard on th' lad. He's our own son, Joan: carried away wi' his own plans for getting on. He meant no harm—I ha' thought it all out—the thing is he shouldna ha' had th' whole machine trusted to him at his age.'

'And is it really so bad, George, as that we must go back to Lancashire and live in a small house?'

'It is, my lass,' said he, turning away and sitting down, saddened by the distress written on her face. 'There's about a hundred thousand gone, more or less!'

She followed him to his seat. The full light of the lamp now fell on him, and she again noted the worn and aged look he wore. The change in him smote her anew to the heart, and set free again her native founts of tenderness and generosity.

'Oh, my poor owd lad!' she cried, throwing her arms about his neck. 'How terrible it must have been for you to bear! I had hardly thought of that! I believe I've grown a selfish woman, my poor dear! My George! My husband!' She laid her head upon his breast and wept.

'There, my dear lass!' said he, soothing her. 'There! My dear wife! My owd sweetheart! My bonny bride!'

'Don't say these things to me now, George!' she murmured. 'I must think about all this, and see where we are. Have patience with me, won't you?'

'Patience, Joan, my dear!' said he. 'Of course, I'll have patience! And if this business makes us pull well together again, I shall thank God for it from th' bottom of my heart.—Do you know what we shall do, my lass? We'll go away back, out of the hurry and scurry of this London; when all is said and done, it's not very filling or satisfying!—away back to our ain countree! You remember, Joan, how we used to sing, "O the oak, and the ash, and the bonny birken tree!—They all are growing green in my ain countree!" We'll go back, my dear, to our ain folk, and we'll be as happy as ever we were—happier than we ha' been this twelvemonth! I ha' got my eye on that nice little house—for a year or two, at least—wi' th' creeper and the jasmine on the walls, and the evening primroses in the side-garden! And thou shalt be my own brave manager again!—mother o' th' house, and queen o' th' whole place!'

'You are very, very good to me, my dear!' said she.

Truly, 'sweet are the uses of adversity!' This worthy couple were beginning to discover—as

many have discovered before them—that worldly success—the gawds and superfluities of life, are only won by the sacrifice of much of life's essence. The cares of this world and of a family, and the deceitfulness of wealth and ambition, had choked the tender shoots of sentiment and driven love into abeyance, and, therefore, demonstrations of love into desuetude. It was only now, when they were awaked by the shock of their calamity, that they perceived how far apart they had drifted, and then they came together again, provoked by something of the warmth of a new affection!

'And now you will see George—won't you?' asked his wife.—'And about Lord Clitheroe!' she said suddenly. 'He's with George. I suppose he must be told?'

'Of course, he must!' said Suffield. 'Mustn't he? Are you afraid he'll want to cry off with Phemy?'

'He may,' said his wife, 'though not of himself, I think—but he may, under family pressure.'

The discussion of that matter, and of other matters in their mind, was interrupted by the announcement of the servant that Miss Raynor had called and was in the drawing-room.

'I wanted to speak to you about Bell, by the way,' said Mrs Suffield. 'She has called here every day almost since you have been gone, asking how things were going and if you were back yet. I can't make her out. She's so unlike herself—so subdued, so afraid of something, as it were. She hasn't been the same person, it seems to me, since Christmas.'

'Sayst tha?' exclaimed Suffield. 'Dost think she may repent o' her engagement to George? I always thought, tha knows, lass, that Ainsworth was th' man. Poor Bell! It won't do to let her make a mistake! We've had enow o' mistakes in th' family! I must talk to her.'

So they parted then, he to talk to Isabel, and she to make a preliminary statement to Lord Clitheroe, who was sitting by George.

'Well, Bell,' said Suffield, as he entered the drawing-room, 'what's this I hear about tha?'

Isabel turned palpably pale. 'What, uncle?' she asked. Then she exclaimed: 'Oh, how changed you are! My poor uncle!'

'Thou'rt changed, too, I hear. Looking ill and worried, I'm told. Let me look at tha?'

She submitted to his inspection, and blushed under it.

'What dost blush for?' he said kindly. 'I believe thou'rt turning more of a silly girl than thou ever wert! But tha doesn't look well. Tell me: what's th' matter?'

'I'm really very well, uncle,' said she. 'But I have been troubled about you. How has this business turned out with you, uncle? Aunt has told me something of it.'

He was silent, as if considering what he should say.

'Won't you tell me?' she said.

'Well,' said he, 'things have turned out what would be called "bad;" but somehow their "badness" makes me happier than if they had

turned out better. We'll ha' to give up this house at once, and sell or let the Hall and all about it; we shall be just able to keep the works going, and so we'll ha' to live in a very economical way in a small house for some years.'

'My poor dear uncle!' exclaimed Isabel.

'Law bless thy heart and soul!' said he. 'I like to think of it! I shall be out of this blessed Parliament business; and I'll go back to real work!—And,' he added in a lower tone, as if to himself, 'the wife and I'll be together again!'

'Uncle,' said Isabel, 'I have a request—a petition—to make of you.'

'Say on, my lass,' said Suffield. 'Thou shalt ha' 't, though 'twere th' half o' my poor kingdom.'

'It's a favour I failed to get from you, uncle,' said Isabel, 'a little while ago.'

'What's that?'

'Take this money now! You need it now, if you didn't before! Don't—please, don't!—refuse me again! Dear uncle, you don't know how much you will oblige me, how happy you will make me, by doing as I ask you!'

'Bell, my dear, let's ha' no more o' that! That money's thine, and 'twill be settled upon thee at thy marriage!—Hast seen George, by the way?'

'Yes,' said she with a blush; 'I have seen him. He is changed too.'

'There's a small favour I ha' to ask o' thee, Bell, my dear,' said her uncle, taking her hand. 'I ha' been a kind o' father to you, lass—ha'n't I?'

'Dear uncle, you have been more than a father!—you've been the dearest friend as well!'

'Now I claim th' privilege o' a father and friend. Answer me a question, like a good, honest girl, as yo' are: Art quite happy in thy engagement to George? Don't be afraid to answer me, my dear!'

Isabel was taken unawares, and was painfully moved; but she kept her self-possession.

'That is a question, uncle!' said she. 'But I will not answer it until you have granted me the favour I ask, and accepted my money.'

Her uncle shook his head, dropped her hand, and turned away. That had barely happened, when Mrs Suffield entered to say that George wished to see his father. Isabel said she could not stay longer that night; so she went, and her uncle and aunt went up to George, who was in bed.

Father and son gripped each other's hand and looked into each other's eyes, with perfect understanding of sincere repentance on the one side, and complete forgiveness on the other.

'It has taken it out of you, dad,' said George.

Then his father, having described his difficulties with Gorgonio and the cotton, demanded an account of his son's—and his prospective son-in-law's—adventures.

'Thou'rt more reduced than me, my lad,' said he.

'I'm all right, dad,' answered George. 'I'll be up to-morrow.'

'No, you won't,' said Clitheroe, stroking his big red beard.—'He caught low fever in Spain,' he observed to Suffield: 'the floods were out.'

'You had rather a bad time of it, then?' said Suffield.

'Very bad,' answered Clitheroe, looking at his hairy hands.

'And where are your prisoners?—I suppose you brought them safe?'

'And now,' said Clitheroe, 'they're in safe keeping!—the brutes!'

'Hain't yo' better tell me all about it?' said Suffield.

'Let me ask you this, father,' said George with a smile, 'before Clitheroe begins his story: Can you understand anybody being afraid of your Tame Philosopher and Secretary?—mortally, supernaturally afraid?'

'No,' said Suffield decidedly; 'I certainly cannot.'

'Well, I have found there is such a man; and his name is Daniel Trichinopoly! M'Fie is the one man in England that Daniel fears, or, for the matter of that, I believe, respects. He has a dread of his tremendous speeches, which he can't understand any more than I can, and he thinks him learned enough to be a wizard or something of that kind. I've told you that, father, because, if it hadn't been for Daniel's fear of the Philosopher, we should never have caught him or the other! He and Tanderjee would have got away a week sooner, and have reached Port Said—where they meant to leave the ship—if Daniel had not been afraid to stir while the Philosopher was weltering in that opium den: he was afraid the spells of the Philosopher would blight his life, if he did not himself release him from that horrible place! And Daniel insisted, in spite of all Tanderjee could say—insisted on staying to release him! So your Philosopher has been of more use than I ever thought he would be!'

'It is certainly most astonishing,' said Suffield.

'But let me hear the whole story.'

Clitheroe then, aided by George at intervals, related their adventures.

They reached Marseilles at midnight of the day after they left London. No regular steamer could possibly reach Gibraltar in time to intercept the *Travancore*; and both floods and bandits were said to be out in Spain, so that the train did not seem hopeful either. They therefore resolved to try to hire a fast steam-vessel, and that without delay, or else they would not reach Gibraltar in time. By exceeding good luck—so good that George called it providential—they met on the quay a yachting acquaintance of Clitheroe's, who was waiting for his belated boat to take him on board his steam-yacht outside. To him Clitheroe told their urgent need, and he at once responded by offering to take them to Gibraltar. Therefore, when the boat came, all four entered it: the owner, Clitheroe and George, and the detective. The weather was foul, and they reckoned it would take them all their time to reach Gibraltar by Tuesday, the *Travancore's* day of call. It was then George showed his prowess and skill as a stoker. He stripped to feed the furnace himself, on a method he had developed for keeping the fire always bright, and forcing the pace without waste of fuel.

'If everything else failed him,' said Clitheroe, 'he would soon get a place as chief-stoker.' (That was his only allusion to their losses.)

They reached Gibraltar in good time, and had everything in order for the arrest of the fugitives. When the *Travancore* came in, they boarded her without ostentation. Daniel was nicely caught as he appeared from below to take the air; and Tanderjee had a hand laid on his shoulder as he stood contemplating the great fortified rock: neither, it was clear, had in the least expected that they might be pursued and arrested. Daniel set his arrest down to the evil divinations of the Tame Philosopher. Daniel wished to throw his turban overboard; but George caught it, and found the plans concealed in its folds. The bank draft on Bombay for the six thousand pounds was found on Tanderjee's person, and in his baggage a considerable number of sovereigns.

'You did very well then, my lad,' said Suffield. 'I was afraid to ask you what success you'd had.'

So they brought their prisoners away in the yacht, without mishap. Daniel's behaviour was singular. He laboured to propitiate George; he was submissive, sweet-tempered, and affable; and he begged that his hands might be left free, even if his legs were tied, so that he might stoke the furnace in place of 'the respectable Sahib George.' But George answered him: 'There is a saying, Daniel, in your own India: "If a man deceives me once, shame on him; if he deceives me twice, shame on me!"' With which words of wisdom Daniel seemed so subdued and humbled that he urged his request no more.

They steamed on for about three days, making but poor progress because of a head-wind. But on the third day a gale arose and grew to a hurricane. They panted and bored through a complete welter and bewilderment of mingled sea and sky. Never, George declared, had he been in such weather, nor had he ever conceived the Mediterranean capable of it. They had been somewhat hugging the Spanish shore, and in their attempt to weather the projecting land between Alicante and Valencia they were driven ashore; but fortunately they drove into a fairly sheltered cove. They passed a terrible night on land, even though after an hour the storm sank almost as suddenly as it had arisen, and though they were able to bring some means of shelter ashore from the yacht. Then they had experience how little Daniel's professions were to be trusted. He and Tanderjee were caught in the night in an attempt on the persons and purses of George and Clitheroe. (The detective had been left on guard over them, but had succumbed to sleep.) In the morning they found a fishing village; but by then George was alternately shivering and burning with fever. By the close of that first day on land he was helpless and delirious, and they had perforce to remain in such poor accommodation as they could find.

'It was a terrible time,' said George. 'But the Spanish folk were very kind; and I should like to go and see them again some day.'

Meantime the owner of the yacht and his small crew took the vessel back to Alicante for such repairs as she demanded. Those left behind resolved to remain until the return of the yacht; for they were in a wild country, far from a railway—and the safety of railway travelling was still uncertain at best—and George was and would be for days unequal to the fatigues of a

rough journey. At length the yacht returned, and so—and so they returned to Marseilles, and home.

'And all's well that ends well,' said Suffield. —'And now, my dear,' said he to his wife, 'would you and our good friend, Clitheroe, mind leaving George and me together? I have one or two things I should like to talk to him about.' When the two had withdrawn. 'You've seen Isabel, I suppose, my lad?' said he.

'Yes, father, I've seen her.'

'And what dost think o' her?—her looks, I mean?—Dostna think she looks ill?'

'She doesn't look well, certainly. I suppose she has been worried like the rest of us. Poor Bell! I don't know why our worry should wear her.'

'That's just it,' said his father. 'I don't think "worry" accounts for it. Hast ever noticed anything in her way wi' yo' that might make yo' think, when yo' consider, that she's not just over head and ears in love wi' yo', my lad?'

'I don't think, dad, she *is* over head and ears: she is very nice and affectionate: I think—I believe—she likes me very much. What more would you have? I don't think Bell is a girl to be over head and ears in love: she is too sensible and wise.'

'That's where, in my opinion,' said his father, 'most o' us are wrong about that girl.—Now, my dear lad, I should be sorry to upset you about nothing; but I think it's best to be frank about this matter I ha' in my mind. Bell is a girl that don't make much fuss about her feelings, but she's got them stronger than most girls. One o' her strongest feelings—I know it: I understand her—is enormous, absurd gratitude to this miserable family for the little we've done for her. It has always troubled her that she had no great chance to show it. A chance came. Dost know, lad, that twice over she's begged and prayed me to take her money—all o't!—to help us in this business?'

'She pressed it—pressed it hard!—on me that afternoon I went away.'

'There yo' are!—Now I ha' it borne in on me—I may be wrong; I hope, my lad, for your sake, I am—that her promise to marry you, lad, is part o' that same absurd gratitude! She knew you wanted her; she knew I'd like it; and she saw latterly your mother was not against it! And so, to please us all, thinking little o' herself, she engages herself to marry you, my lad! And now, when she thinks o' th' thing, it looks a more serious business to give herself away like that than she imagined. I'm sure she's got stronger feelings in her than she ever seems to ha' shown to you, lad. I hope to goodness, my dear lad, I'm wrong. But tha dostna want to mak' another mistake, and tha dostna want, I'm sure, to tak' Bell to wife on those terms. Think it over quietly, lad—speak to Bell about it to-morrow—she'll be here, no doubt—and according as tha finds her, do th' right thing by her and by thyself!'

George was pale and agitated. 'All right, father. I'll think it over.—You'd better leave me alone now, dad.'

'God bless tha, lad,' said his father, with a quiver of the lip, 'and gi'e thee a brave heart!'

George lay still—wretchedly still!—for a little

while; and then suddenly he jumped from bed and hurriedly dressed, weak and trembling though he was. In a few minutes he slipped down-stairs, passed from the house, and called a cab. He must see Bell! He could not wait!

(To be continued.)

THE MONTH: SCIENCE AND ARTS.

THE question has been mooted whether it is possible to raise the wreck of the ill-fated 'Victoria' from her watery grave of eighty fathoms (four hundred and eighty feet). It is reported that a firm has already offered to undertake the work of salvage; but it is improbable that there is any possibility of floating the vessel. The greatest impediment is that of depth, for even with improved apparatus the diver—whose help in stopping leaks is imperatively demanded, as the prelude to such operations—is limited in his excursions from the surface of the water. The greatest recorded depth to which any diver has penetrated is claimed for Captain Christiansen, who recently, at Elliott Bay, Washington Territory, remained for twenty minutes at a depth of one hundred and ninety-six feet from the surface. It may be mentioned here, that, according to the calculation of an officer of the United States navy, the blow which sent the 'Victoria' to the bottom of the sea had a force equivalent to that of a railway train of six large Pullman cars drawn by the heaviest locomotive and running at a speed of fifty miles per hour.

A most magnificent specimen of a sixteenth-century Persian carpet has just been acquired by the South Kensington Museum. It has come from the Mosque of Ardabil, where it has been well known and much coveted for some time past. The sum required for its purchase was so great that had it not been for the generosity of several English gentlemen, the nation would not have been able to secure this carpet, which is quite the finest of its kind in Europe. The groundwork is of dark blue, ornamented with a floral design; the centre consists of a large medallion worked in pale yellow, with various coloured cartouches disposed round it. Each corner of the carpet contains a section of the same pattern as the centre medallion, with cartouches surrounding it. The border is very beautiful, and is formed of alternate long and circular panels, around which—on a brown ground covered with a floral pattern—is a lobed outline. A panel bearing the following inscription makes a heading to the carpet: 'I have no refuge in the world other than thy threshold. My head has no protection other than this porchway. The work of the slave of the Holy Place, Maksoud of Kushan, in the year 942 (1535 A.D.).' 'The work of the slave' Maksoud is thirty-four feet six inches by seventeen feet six inches, and so finely is it woven, that there are three hundred and eighty knots, all hand-tied, in a square inch. There are thirty-three million hand-tied knots in the whole carpet. As a work of art this carpet is most remarkable, on account of its beautiful colouring, grand design, great size, and extreme fineness of texture. The fact also of the date and place of manufacture being inscribed upon it, acts

as a guide in trying to fix the date and locality of certain textures of Persian carpets.

The extent to which the flowers of the 'Chrysanthemum cinerariifolium' are cultivated in Dalmatia in order to supply the world with so-called insect powder is little known. The plant can be cultivated in almost any kind of soil, and it is a matter for some surprise that it should hitherto have been confined to the Austrian province of Dalmatia and the neighbouring Montenegro. The flowers find a market at Trieste, where the annual value of the trade amounts to as much as fifty thousand pounds. But it would seem that there will shortly be competitors to deal with, for the plant has recently been introduced into South Africa, California, and Australia. It is said that the plantations in Dalmatia have suffered much from the severity of the past winter, and the result of the recently gathered harvest is therefore awaited with some anxiety.

The question has often been asked, whether any meaning is to be attached to the song of birds, and some doubt has been thrown on the supposition that joy or sorrow is thus expressed by the fact that birds have been known to break into apparently happy melody when flames have been threatening their cages. Dr Morris Gibbs, an American naturalist, has been making observations in this direction by robbing the nests of song-birds and then listening for the result, allowing in every case ample time for the more gifted male to hear of the burglary. In no case was it possible to say that the song which ensued expressed sorrow or complaint; and Dr Gibbs says that he could never distinguish any difference between it and the warbling he was accustomed to hear. While expressing a hope that the burglar duly restored the stolen property after he had satisfied his curiosity, we may venture to remark that as there are sounds beyond the limit of the human ear to appreciate, so there may be others the meaning of which the ear can never fathom.

The *Journal des Mines* in a recent issue states that the trade of the island of Madagascar in 1892 received a decided stimulus by the discovery of a new india-rubber tree. The discovery of this tree came very fortunately to relieve the Madagascar market, which was at such a low ebb that the Tamatave houses were closing their agencies on the north-east coast, and the Americans suppressed their Majunga houses. The discovery is of very great importance, and almost constitutes a commercial revolution. The trade formerly carried on between Farafangana and Fort Dauphin was confined to a few products, which were obtained only in small quantities. Merchants were almost completely disheartened, and had abandoned the market to small traders. As long as the working of the new rubber tree lasts, things will go well; but unfortunately the probable duration of this working is estimated at only two years.

A firm of manufacturers in Chemnitz has patented a new material which is said to be admirably adapted for curtains. In composition it consists of seventy-five per cent. of india-rubber, three per cent. wool-dust, five per cent. pulverised fruit-stones, ten per cent. amber varnish, and five per cent. leather waste, to which infusorial earth

can be added if convenient. This compound, after being tempered with carbon bisulphide, is kneaded into a thick mass, which is afterwards rolled into leaves and decorated as fancy may dictate.

Mr W. S. B. Woolhouse, a distinguished mathematician, who died in London recently at the age of eighty-four, had at one time a curious problem to solve. This was in connection with the Ten Hours' Bill, and the question to be determined was the distance daily walked by a factory girl in attending the 'mules'—running backwards and forwards and tying the threads. The late Lord Shaftesbury commissioned the mathematician to go down to Manchester and obtain the necessary data; and the journey was made, the calculations done, and the report of the result sent off the same evening. It was found that each girl made a journey of upwards of thirty miles daily—a record which would put to the blush many strong men who regard themselves as able pedestrians.

A new method of preserving timber is by the use of naphthaline. The timber to be treated is placed in a tank of the liquid, which, by means of steam-pipes, is maintained at a temperature of about two hundred degrees Fahrenheit. According to the size of the timber, it is subjected to immersion in this heated liquid for from two to twelve hours, during which time the sap is expelled and the naphthaline takes its place. It is said that the system gives excellent results, and that wood treated in the way described is so susceptible of polishing that the mere rub with a rag will make its surface shine.

The unveiling of a granite memorial, and the presentation of congratulatory addresses to Sir J. B. Lawes and Dr Gilbert at Rothamsted, is an event that must not be passed over in silence, for the occasion is unique. For fifty years past have these two industrious workers been solving problems and making careful experiments in order to place agriculture on a more scientific basis. Both in the field and in the handsome laboratory which they have equipped, has this work gone on continuously for the past half-century, and this at the expense of Sir J. B. Lawes. Not only this; but the work is not to cease although the original labourers must at some time rest. The experimental ground and the laboratory, together with a sum of one hundred thousand pounds, are vested in trustees, and the future guidance of the magnificent enterprise will be under a Committee. It is seldom that a great work like this which might well be expected from a Government department, is undertaken by individual and unselfish effort.

The gradual development of the railroad is well illustrated in the 'Transportation Building' of the Chicago Exhibition. First, there is part of the plank road laid by the Romans across a moor near Osnabrueck, which was unearthed last year from the six feet of moss, &c., which had covered it, and probably preserved it. The wooden planks are of course much decayed; but the method of fastening down by long wooden pins is quite apparent. Another type of tramway is illustrated by a thirty-inch gauge road dating from the sixteenth century, and still in use in many parts of Hungary. Next is shown a piece

of the rough road with its cast-iron rails which was in use in Wales more than a hundred years ago. It was upon this railway that Trevethick tried in 1804 to run an engine driven by steam. These old methods of laying railroads are contrasted with great effect with the ponderous steel railroads of to-day.

A curious reversion to an old photographic process is seen in the productions of the recently established Birmingham Dry Collodion Plate and Film Company. The dry collodion plate dates from 1856, and at one time it was largely used, especially by landscape photographers. It was so slow in action that it was not adapted for portraiture, and we need hardly say that such, so-called, instantaneous pictures as are now possible with gelatine plates were quite beyond its ken. But about three years ago it was announced that Dr Hill Norris, who was one of the pioneers of the process, had solved the problem of producing a dry collodion plate which was equal in rapidity to gelatine, and the company above mentioned was formed to work the process. It remains to be seen whether these anticipations will be realised. If, happily, they should be, photographers will have at their disposal a plate combining more advantages than any light-sensitive surface yet discovered.

The electric current as now 'laid on' in so many Metropolitan thoroughfares is likely to prove an immense boon to manufacturers requiring motive-power at a cheap rate. The current can be switched on or off as required, and the consumer pays only for what he uses. We recently saw in a workshop in London an automatic shaping-machine worked by the electric current from the street main. In this case the motor was doing all the work of a gas engine which it had replaced, and although it was kept constantly at work during the daylight hours, the cost of current was less than two shillings per week.

The operation of building a boat is always a pleasant one to watch, for from the time when the keel is laid it seems to gradually grow under the workman's hands as he adds plank to plank and secures each by copper nails. But this mode of construction is now giving way to a very different one. Boats are now being made of mild steel in two halves, which are pressed into shape by hydraulic power. The two parts are riveted to a metal bar which is bent up to form stem, keel, and sternpost all in one. Buoyancy chambers are then added, the usual fittings put in place, and the thing is complete. Such a boat, it is found by experience, is far more efficient than a wooden one; it offers so little friction to the water, that it will sail faster and pull easier than a boat of the old kind; and it will never leak, although it may be kept out of the water for months at a time.

According to the 'Newcastle Chronicle,' the police of that place are provided with a telephonic apparatus, which by means of an affixing pin and small key will enable them to communicate with the fire brigade through the medium of the street fire alarms placed in various parts of the city. In the case of a fire occurring on his beat, the policeman would open the glass door of the fire alarm, affix his telephone to the apparatus and would then be in direct communication with the brigade, so as to give them the

exact locality of the fire, and thus save those first precious minutes which often decide the fate of a burning building.

Five years ago, a Commission was appointed to inquire into the action of light upon water-colours; and as a result, certain pigments were found to be most fugitive, and therefore not fit for use by the painter. But it was found that all pigments preserved their tints if deprived of air. Acting upon this hint, Mr W. S. Simpson has devised a means of keeping water-colour drawings 'in vacuo,' and therefore quite protected from both air and damp. The plan is a simple one, the drawing being laid face down in a tray having a glass bottom, and being then covered in at the back; by means of a Sprengel pump the air is then exhausted from the little chamber formed by the tray, and the picture is subsequently sealed up. By means of a small instrument attached, it can be seen if any leakage occurs; but if the seal remain intact, the picture may be regarded as absolutely safe from any chance of fading.

The 'Primula obconica,' a very beautiful and favourite plant, has been charged again and again with very mischievous effects upon the skin of those who handle it; while others who are well acquainted with plants have found it to be quite innocuous. It would seem, however, that certain persons are affected by it. A doctor, writing to the 'Lancet,' describes how a lady patient of his, in order to test the question, lightly brushed a bundle of leaves of the suspected plant across her forearm, with the result that twelve hours afterwards an eruption appeared, accompanied by an almost intolerable itching. She also found that the fingers after touching the plant would communicate the eruption to the face. Before this test, the patient in question had suffered much from skin irritation, but with the banishment of the cause the malady ceased altogether.

The plague of wasps which this exceptionally dry summer has brought upon us has caused many suggestions to be made as to the best way of destroying these destructive insects in their nests. The killing of a few stray wasps has little effect in diminishing their numbers, and they must be attacked *en masse*. A spoonful of powdered potassium cyanide dropped into the entrance of a nest at night-time is said to be effective in destroying all the inmates; but the risks attaching to the handling of such a deadly poison are far more serious than any connected with wasps. Coal-tar mixed with paraffin to render it more fluid, is a good and cheap nest destroyer, and we have used a small quantity of strong ammonia with effective results. The correspondent of a contemporary asserts that a pledget of tow dipped in coal-tar and thrust into the entry to the nest will effectually dispose of the inmates. They do not store food, as bees do, and are dependent upon a daily supply; and as they will not, or cannot, get through the tarry obstruction, they quickly die by starvation. It is certain that all nests discovered should be destroyed, or the prospects for next season will be alarming.

Experiments have recently been made by Rigler with a view to determine the value of ammonia vapour as a disinfectant, when various organisms were subjected to treatment, including Koch's cholera bacillus, the typhoid

bacillus, and the bacilli associated with diphtheria and anthrax. These organisms were exposed in a room filled with ammonia vapour, while at the same time others were exposed to air. In every case the ammonia vapour killed the organisms in from two to four hours. It is therefore indicated that ammonia vapour is a valuable means of disinfection; and its cheapness, cleanliness, and harmless character as regards furniture and clothing should further recommend it. It would be interesting to know whether a room charged with ammonia vapour to such a degree as not to impede a person's breathing would have a beneficial effect upon a patient suffering from any one of the diseases which the bacilli experimented upon represent.

A statement was recently made to the effect that the eucalyptus takes six months to sprout, and that sixty years must elapse before it grows into a tree of respectable proportions. Lieutenant Sclater, who has had much experience of the tree in Africa, says that this is a mistake. At Blantyre there is a fine avenue of these trees, which were planted by the Church of Scotland Mission only sixteen years ago, and now they are sixty feet high and from two to three feet in diameter. Other trees had grown to twenty feet high in as many months. The two statements possibly refer to eucalyptus trees of different varieties.

ON EXTINCTION.

THE passing away of ineffective things, the entire rejection by Nature of the plans of life, is the essence of tragedy. In the world of animals, that runs so curiously parallel with the world of men, we can see and trace only too often the analogies of our grimmer human experiences; we can find the equivalents to the sharp tragic force of Shakespeare, the majestic inevitableness of Sophocles, and the sordid dreary tale, the middle-class misery, of Ibsen. The life that has schemed and struggled and committed itself, the life that has played and lost, comes at last to the pitiless judgment of time, and is slowly and remorselessly annihilated. This is the saddest chapter of biological science—the tragedy of Extinction.

In the long galleries of the geological museum are the records of judgments that have been passed graven upon the rocks. Here, for instance, are the huge bones of the 'Atlantosaurus,' one of the mightiest land animals that this planet has ever seen. A huge terrestrial reptile this, that crushed the forest trees as it browsed upon their foliage, and before which the pigmy ancestors of our present denizens of the land must have fled in abject terror of its mere might of weight. It had the length of four elephants, and its head towered thirty feet—higher, that is, than any giraffe—above the world it dominated. And yet this giant has passed away, and left no children to inherit the earth. No living thing can be traced back to these monsters; they are at an end among the branchings of the tree of life. Whether it was through some change of climate, some subtle disease, or some subtle enemy, these titanic reptiles dwindled in numbers, and faded at last altogether among things mundane. Save for the riddle of their scattered bones, it is as if they had never been.

Beside them are the pterodactyls, the first of vertebrated animals to spread a wing to the wind, and follow the hunted insects to their last refuge of the air. How triumphantly and gloriously these winged lizards, these original dragons, must have floated through their new empire of the atmosphere! If their narrow brains could have entertained the thought, they would have congratulated themselves upon having gained a great and inalienable heritage for themselves and their children for ever. And now we cleave a rock and find their bones, and speculate doubtfully what their outer shape may have been. No descendants are left to us. The birds are no offspring of theirs, but lighter children of some clumsy 'dinosaurs.' The pterodactyls also have heard the judgment of extinction, and are gone altogether from the world.

The long roll of palæontology is half filled with the records of extermination; whole orders, families, groups, and classes have passed away and left no mark and no tradition upon the living fauna of the world. Many fossils of the older rocks are labelled in our museums, 'of doubtful affinity.' Nothing living has any part like them, and the baffled zoologist regretfully puts them aside. What they mean, he cannot tell. They hint merely at shadowy dead subkingdoms, of which the form eludes him. Index fingers are they, pointing into unfathomable darkness, and saying only one thing clearly, the word 'Extinction.'

In the living world of to-day the same forces are at work as in the past. One Fate still spins, and the gleaming scissors cut. In the last hundred years the swift change of condition throughout the world, due to the invention of new means of transit, geographical discovery, and the consequent 'swarming' of the whole globe by civilised men, has pushed many an animal to the very verge of destruction. It is not only the dodo that has gone; for dozens of genera and hundreds of species, this century has witnessed the writing on the wall.

In the fate of the bison extinction has been exceptionally swift and striking. In the 'forties' so vast were their multitudes that sometimes, 'as far as the eye could reach,' the plains would be covered by a galloping herd. Thousands of hunters, tribes of Indians, lived upon them. And now! It is improbable that one specimen in an altogether wild state survives. If it were not for the merciful curiosity of men, the few hundred that still live would also have passed into the darkness of non-existence. Following the same grim path are the seals, the Greenland whale, many Australian and New Zealand animals and birds ousted by more vigorous imported competitors, the black rat, endless wild birds. The list of destruction has yet to be made in its completeness. But the grand bison is the statuesque type and example of the doomed races.

Can any of these fated creatures count? Does any suspicion of their dwindling numbers dawn upon them? Do they, like the Red Indian, perceive the end to which they are coming? For most of them, unlike the Red Indian, there is no alternative of escape by interbreeding with their supplanters. Simply and unconditionally, there is written across their future, plainly for any reader, the one word 'Death.'

Surely a chill of solitude must strike to the heart of the last stragglers in the rout, the last survivors of the defeated and vanishing species. The last shaggy bison, looking with dull eyes from some western bluff across the broad prairies, must feel some dim sense that those wide rolling seas of grass were once the home of myriads of his race, and are now his no longer. The sunniest day must shine with a cold and desert light on the eyes of the condemned. For them the future is blotted out, and hope is vanity.

These days are the days of man's triumph. The awful solitude of such a position is almost beyond the imagination. The earth is warm with men. We think always with reference to men. The future is full of men to our preconceptions, whatever it may be in scientific truth. In the loneliest position in human possibility, humanity supports us. But Hood, who sometimes rose abruptly out of the most mechanical punning to sublime heights, wrote a travesty, grotesquely fearful, of Campbell's 'The Last Man.' In this he probably hit upon the most terrible thing that man can conceive as happening to man: the earth desert through a pestilence, and two men, and then one man, looking extinction in the face.

S H E C O M E S.

I.

I sit beside the stream; and all the air
Is full of insect life. A heron dips
And flaps away. The noon-day's welcome glare
Brings drowsiness to every bee that sips.

II.

I hear Her coming! Hear her soft-shod feet
Along the dun dust road their owner bear.
Anon the winding lane will hide my sweet,
But my warm fancy pictures her still there.

III.

I feel Her coming! Glancing swallows bring
The news in flights; and each bird will rejoice
With gentle flutter, and prepare to sing
Some strains to suit the music of her voice.

IV.

I see Her coming! Fairer than before
She seems to me in grace, in every part.
Will her repose some calm to me restore? . . .
Oh! may my eyes not show her all my heart.

OLD SONGS AND NEW SAWS.

By MRS LYNN LINTON.

A VOLUME of old sea-songs makes interesting reading. It is all so archaic, so old-fashioned, yet fresh withal. The days are so far off when sailors were crimped and their Susans waved lily hands while their Annas died—when Neptune and Freedom claimed equal parts in the 'snug little island,' and the sea existed chiefly for the benefit of Britannia and her ships—when one Englishman could lick three Frenchmen, and the cry that Britons never shall be slaves went up to heaven in one of the proudest shouts the world has ever heard—when the defeat of the Invincible Armada was still a living fact in the hearts and minds of our brave, bluff, grog-drinking blue-jackets, inspiring them with confidence and honouring themselves in their predecessors—those days are all so far off now as to almost belong to another era and another race; for that sentiment of national glory and honour which they embodied has become as an idle dream. If Dibdin were to write in the same spirit to-day, he would be assailed by the press as a brutal and unimaginative Jingo; and it would be incontestably shown how far out he was in his calculations, and how, instead of success commercial, military, or naval, we Britons are doomed to failure all round—instead of victory, it is we who shall have to bite the dust, and submit to defeat in any European war that may come.

Perhaps it is so. With our 'hearts of oak' may have gone the gallant tars who manned them. Under present conditions the fighting force of a ship is greater, but the fighting value of the men is less than in the olden time. It is not men so much as machinery—not fighters so much as scientific mechanicians who crowd that huge floating workshop. Valour is at a discount, but a good eye is as priceless as was once a stout heart; and the stoker and engineer in their stifling dogholes are of infinitely more importance than the blue-jackets on deck—pic-

turesque, breezy, well-disciplined, but more automatic than in the old boarding and individual times. This change of function may have really touched the temper of the service. Undoubtedly it is less rough than in the old grog-loving days. Not even Rudyard Kipling, the most masculine of our modern writers, would put out songs such as 'Nothing like Grog,' 'The Flowing Can,' 'The Sailor's Sheet-anchor'—said sheet-anchor being 'Grog, smiling Grog'—with others of like character. In a day when great lords forbid the sale of so much as a glass of beer on their estates, and force all their hotels and wayside inns to be teetotal, the praises of 'Grog' would not be well received, and the 'can of flip' is out of date. All other things have undergone this law of change. The dainty tastes and philanthropic softness by which this generation is distinguished, have robbed the navy of its former discomforts; and the danger now is, not of unnecessary hardship but of undue coddling, by which our sailors, like our soldiers, will be rendered less fit for the rough work of war than were their less delicately handled and more Spartan-bred predecessors. Be that as it may, the sea-songs of nigh a hundred years ago breathe a spirit for which one may look in vain among our modern utterances, and we have instead a string of sayings—a set of principles utterly at variance with all we have as yet ever known or honoured.

For the old war-cry embodied in our patriotism we have substituted a something we call cosmopolitanism, which we make synonymous with civilisation, while patriotism or love of one's country is dismissed as Jingoism, the which is as a word accursed. We are told that monopoly is base, mean, selfish—the very antipodes of that altruism which as Christians it is our bounden duty to practise, which as civilised men is the sign and seal of our moral and intellectual culture. We are to have no monopoly, neither of country nor family. A very charming writer has told us so, and has shown—to his own satisfaction, at all events—what a sadly selfish and immoral

thing patriotism is. No more sea-songs glorying in our own prowess and the defeat of our foes. Instead of these, pretty little piping pæans, lauding universal peace, which we are somehow to inaugurate by giving up all pretensions to superiority everywhere, by generously opening the gates whereby our enemies may come to afternoon tea in our citadel, and our rivers may be made available for their ships of war to fraternise with our house-boats. It is a lovely picture. A doubt may arise in the minds of the sceptical whether it be possible or no. But then the sceptical, like the Cassandras, are nuisances. When they fall into the midst of the believers, the chances are they will be put out like non-paying tenants, deficient as they are in their tithe of faith in a new human nature and a new cosmopolitan policy.

One of the modern phrases which covers a great deal of ground is that well-worked 'fin-de-siècle.' Now nothing is so arbitrary as well as conditional as time. Beginning with the rotation of the earth, which of itself is not absolutely unchangeable, man goes on to the self-made and arbitrary numeration of hundreds and thousands of years. Our day and night, seasons and the years can be accounted for, and their influence on nature, and on man with the rest of nature, is a physical fact. But when we come to the end of one conventional batch of years, how in the name of fortune should there be any valid change in the condition of things human and historic? Why should the end of the century excuse—still less explain—the sudden outbursts of feminine eccentricity and of unpatriotic impulse, for both of which their apologists think they have said all that need be said when they murmur 'fin-de-siècle?' What has this 'fin-de-siècle' to do with the queer state of mind which makes certain men laugh to scorn the idea of fighting for their country should it be invaded? 'Invaders should just once bite of the dust, and not a bit more of the island,' sounds to them sheer nonsense. What does it matter under whose régime we live? 'Give me forty pounds a year, and let me live in the sun in Italy, and I would not care who governed in England,' said one of our modern patriots. 'I should prefer Frenchmen to my own countrymen,' said another of the same school. 'The French are artists, and we are not.' 'It would be a good thing,' said a third, 'if we were conquered and ruled by a foreign power; it would make a better amalgam.' That was his translation of the modern idea of a universal brotherhood. But these same impartial cosmopolitans all demand that Britain should give up India, Burma, Egypt, come out of Mashonaland, cease to share in the partition of Africa, and should bring the Empire down to the nice manageable little dimensions of Holland or Belgium, with Scotland for our summer quarters and England for our winter, and the Continent to remain as now, the waste vat wherein to pour our superfluous margin.

'The union of hearts' is another phrase which has travelled beyond its original application. It is a phrase full of beautiful suggestions, far more beautiful than those rough old injunctions to 'stand to their guns' and 'conquer again and again,' which the sea-songs of a former time insisted on. This union is always to be accomplished by the strong giving the weak the power of damaging and annoying. Set that weaker creature on horseback and then make sure that he will meekly trot at the heels of a pedestrian leader. Put the whip into his hands and the raw places well within sight and touch, and then make just as sure that he will not flick the lash when his own good is to be got out of that other's pain. This may be sublime philosophy, but somehow it does not quite smack of an unregenerate human nature; and the experiment would be hazardous, all things considered. 'Put your trust in God, my boys, and keep your powder dry,' has a better ring and seems more likely to scan right.

Again, no modern word has done so much harm as that tip-tilted sneer of 'gush.' It bans all honest enthusiasm and casts the cold shadow of contempt on the rose-coloured energies of praise. It reduces the expression of patriotism to bunkum, and that of personal affection to the silliness of sentimentality. Over whatever it passes it leaves the traces of blight, and the mildew of its poison mars the fairest thought and the sweetest emotion. But those old sea-songs are full of what the modern 'fin-de-siècle' school would call 'gush.' They are all the lovelier on that account, and have all the firmer hold on the natural and sincere. When they aver that no spot on the globe is so perfect, so beautiful, or so happy as England, we may smile; but we think that 'better form' than the lavish abuse of our own country which it is the fashion of the day to pour out. When they celebrate our victories and talk of our flag as a sacred emblem which a man would rather die than desert, that comes home to our heart more than the cynical sneer of the most un-English of Englishmen when he affirms that he does not even know our flag—would not be able to tell it from the German, the French, the Italian, and would not care a button for it if he did. Black-eyed Susan is somehow a more sympathetic figure than the future Mrs 'Awkins. 'My old Dutch' will never put the extinguisher on 'John Anderson my Jo'; nor does the hero of 'You can't 'elp likin' 'im' come within hailing distance of 'Tom Bowling.' Say what we will, there is a spirit in these old songs which preserves them alive, for all the old-fashioned garb in which they are clothed. And between jolly tars and costers we should imagine that even the music-hall masher would not hesitate as to which make the most picturesque figures, and which lend themselves most easily to song. The coster's dialect and the seaman's quaint expletives settle the philological point between them—but not in favour of the *h-less* 'Energ.

What a difference, too, there is between the cheery optimism of those old sea-songs and the pessimism so fashionable at this present time! Nowadays, every one talks bewailingly of his luck, and falls foul of the times or Fate, should he but get his finger pinched by his own careless-

ness, or catch an influenza cold after sitting in a draught. But the ideal tars whom Dibdin immortalised found time to praise God, and could be cheery and merry with half their members shot away, and even snuff and a quid rendered impossible. There were no lugubrious prophecies then of the time when the black and yellow races shall be stronger than the white—when all the possessions now held by Britain will have to be given up because taken from her—when the life of man shall be nothing but a dull gray monotonous interlude between two blanks—when even family affection and natural instincts shall have died out like patriotism and nationality. Man was not proved then to be steadily degrading—we English shown by that sapient German to be the head and front of the decadence. We held our own, resisted interference, took with a high hand what we wanted, and defied 'Devil or Don' to do his worst. The former we flouted by the grace of God still believed to be working in us and for us; the latter we mentally mauled on the grand old plea of our general superiority to the whole family of Mounseers—otherwise, the Latin races. And the sentiment justified itself, as it was justified by fact. The bewailers over life's iniquities, and the prophesiers of evil days to come, as well as the assertors of our national decadence, do not seem to remember that they help to bring about the things they assert will come. Things cannot 'be in the air' unless they are put there by the voices of the crowd; and when an evil prophecy has been shouted out loud enough and often enough, it will surely come to pass. Prophecy a man's death but long enough and your prophecy will be fulfilled. And what is true of individual deaths, is true of national decadence and national disaster—to which these Jeremiahs themselves contribute.

POMONA.*

By the Author of 'Laddie,' 'Tip Cat,' 'Lil,' &c.

CHAPTER XI.

What is love? 'Tis not hereafter;
Present mirth hath present laughter;
What's to come is still unsure.

SHAKESPEARE.

It can easily be imagined what a bewildering effect the appearance of Maurice Moore produced on Dr Merridew, all the more so as he was conscious of having heard the name; but, having always connected it in his mind with a one-eyed fisherman catching lobsters, it required a thorough readjustment of all his previous ideas to realise that Maurice Moore had all along been this tall, handsome, young fellow of distinguished appearance.

And Sage's radiant face was a revelation too; it was this that first attracted his attention when she came into his studio. It was something more than a restoration of the peaceful, placid, little girl that he knew before she went to Scar; it was a new little daughter, perfectly happy, standing in the full sunshine of content.

He could not take his eyes off her for a minute, and so he did not notice her companion till Sage's voice, with a new ripple of music in it, said: 'Father, this is Mr Maurice Moore;' and he turned round to find that Maurice Moore was not, as he had understood, a one-eyed fisherman. It took him all tea-time and the consumption of a good many muffins to get used to the idea; and he kept stealing furtive little glances at Sage, to assure himself that this little daughter of his—a dear little girl, no doubt, and, for the matter of that, a good deal better than most people's daughters, but still only little, every-day Sage, whom he laughed at and teased, whose ear he pulled, and whose opinions he pooh-poohed—had it in her to secure the friendship of such a man as Owen Ludlow; and, apparently, the love of such a young Apollo as this Mr Maurice Moore. He always felt that apologetic feeling about his children that Touchstone had for Audrey, 'An ill-favoured thing, but mine own'—a feeling quite compatible with the greatest love and admiration. It is quite comical, sometimes, to see the difficulty parents have in recognising that their offspring are full-grown men and women, standing on their own merits before the eyes of the world; they are still 'my son' and 'my daughter,' and, as such, to be modestly depreciated, as one would one's features or the colour of one's hair, though he may be a hero of world-wide renown, and she a beauty reigning over the hearts of men.

'Come and have a pipe in the next room,' the painter said to Dr Merridew, when tea was over and the children were arranging '*abiaux vivants*' with the vast assistance of Mr Collins's beautiful Oriental costumes, which Warren, the old butler, put at their disposal; and Sage and Maurice were examining a portfolio of sketches with long, long pauses between each, and low-toned criticisms, with heads bent close together over those artistic treasures. 'Come and have a pipe. I think you have a right to demand some explanation of this'—with a meaning glance to where Sage and Maurice sat in blissful unconsciousness of the world outside Eden.

'I think I have,' the doctor replied rather dryly.

'It was not of *malice prepense*,' the painter went on. 'I had no more notion last night of Maurice being here to-day than the man in the moon. But when I got back from your place, I found him established here. You know he was at Scar last September; and I warned him off then, for I saw he was getting too fond of your little girl, and I knew it was out of the question.'

'Out of the question?' interrogatively from the doctor.

'Well, you see he is a poor man.'

Dr Merridew's eyes, that had been fixed on his own shabby coat-sleeve and his cuff, somewhat fringed at the edge, raised themselves reflectively to the well-dressed, nicely-turned-out figure he could see through the half-open door by Sage's side; and Mr Ludlow replied to that glance, though the feeling it expressed was not put into words: 'You understand as well as I do that

riches and poverty are merely comparative terms ; and a man is rich or poor exactly in the same proportion as his expenses correspond with his income. A man with expensive tastes is poor, whatever his income may be ; and Maurice Moore has such tastes.'

'And how has the situation altered since last September?'

The painter stammered, and got rather red. Just then, he felt that he did not much like Dr Merridew ; there was a certain blunt directness about him that was tiresome, and bordered on the brutal.

'Well, it appears that the lad was rather harder hit than I supposed ; and he can't get Sage out of his head. I've a liking for the boy ; there's a lot of good stuff in him ; and when he came in last night and said, "I can't get on without her ; and I've made up my mind, if she'll have me, to chuck this diplomatic business, and settle down to some quieter way of earning my bread and butter, which won't make it necessary to spend two guineas while I'm earning one."'

'And how about the expensive tastes which made it out of the question in September?'

'Come, Dr Merridew, we're both of us getting old fellows now ; but from what Sage tells me, there was a time when you were not more worldly-wise than I was, when, with no prospects worth speaking of, I married a penniless girl because I loved her.'

The doctor grunted moodily : 'I don't quite see, Mr Ludlow, because one man or even two have done a foolish thing, that it is any reason for another doing it.'

'Do you know—did Sage tell you?' the painter said, ignoring the doctor's last very sensible remark—'how curiously alike our experience of life has been in some ways?' And then he told the doctor, as he had told Sage, of his marriage and his loss, and of the baby girl, who would have been the very same age as Sage if—And the doctor stretched out his hand and wrung Ludlow's with hearty sympathy and tears in his shrewd, sensible eyes.

There was no reason why this curious similarity in their past histories should have made any difference about Sage and Maurice ; but men are so very illogical when their affections are concerned, that Ludlow felt as if he had brought the most conclusive arguments to bear on the subject ; and Dr Merridew felt more than half-convinced by them, though he still tried to keep up an appearance of disapproval.

'Well, you must hear what the lad has to say about it himself to-morrow. He has all sorts of notions of what he can do ; and I have always felt that he was worth something better than the idle society life which does not seem likely to lead to anything better. I don't know what his people will say to his change of programme ; they are smart sort of people.'

The doctor's face clouded. 'I won't have that,' he said. 'I won't have my girl marry into a family that looks down on her, and thinks she's not a match for their son. I don't mind their being poor, but'—And then he gave a little laugh. 'I'm a nice person, though, to talk in this way, when my wife's family wouldn't look at me, and I married her in spite of it. I don't know if Sage told you that part of the story that

my wife had to choose between me and her family—between poverty and wealth—between Dalston and Park Lane ; and she chose me with all my drawbacks, and never regretted it. But I won't say that it didn't give me a bad half-hour now and then, when I thought of all she had given up ; and all the more, perhaps, because she never seemed to feel it a bit. And sometimes now I get a pang on Sage's account, when I think of the difference it might have made in her life if her mother's people would have looked her up a bit.—By Jove, now ! I daresay Moore's fine folk would think the better of her if they knew that her grandfather was a baronet, and her first-cousin one of the richest heiresses in England.—But no ; thank you. I won't be indebted to them even as far as that ; so we'll keep it to ourselves, if you please.'

And then the children came in to fetch them to see the tableaux, and any further revelations about Sage's aristocratic relations were put an end to.

That was the very jolliest Christmas-day there ever had been, the boys declared, only the evening passed much too quickly. The tableaux were awful fun, especially when father and Mr Ludlow came and arranged them, and took part in them too ; and some of them were capital. They must have been good, for Sage and Mr Moore were never tired of looking at them. And then came a splendid snapdragon, and they all burned their fingers in fishing out highly spirituous plums ; and then there were games. Mr Ludlow seemed to have a never-ending variety to suggest ; and in one of these games, in which it was necessary for two of the company to go outside the room while the others were making mysterious arrangements within, these two happened to be Dr Merridew and Kitty.

'Why did you never tell me about Maurice Moore, Kit, you base deceiver?'

'I've told you heaps and heaps about him ; but you never would pay any attention. Isn't he awfully handsome and nice?'

'Then why did you lead me to suppose he had only one eye?'

'Come in ! We're quite ready.'

This summons saved Dr Merridew from con-dign punishment at the hands of his youngest daughter.

Supper, though the boys emphatically described it as 'ripping,' came all too soon, and though it was prolonged by crackers to an almost indefinite extent, it came to an end at last ; and then Dr Merridew declared they must go home immediately, if not sooner ; and the girls went to put on their hats, with much open reluctance on Kitty's part, and perhaps even greater reluctance concealed on the part of Sage.

As Dr Merridew and the boys were putting on their greatcoats in the hall, the doctor found Maurice Moore by his side. The doctor felt as shy as a girl at this interview with a son-in-law presumptive, and he had not spoken two words to him all the evening ; and now he did his very best to avoid it by sudden officiousness in the matter of helping Nigel on with his coat ; but that impracticable youngster wriggled out of the paternal clutches to pull a final cracker that had just turned up on the supper table intact, and left his father to his fate.

It is a great mistake in interviews of this description to ascribe all the painful feelings to the young suitor. The stern parent, who is supposed to inspire such awe and trepidation, generally endures quite as much himself, and is as heartily glad when it is over as the most bashful and palpitating youth.

'Dr Merridew, what time shall I be most likely to find you disengaged to-morrow? I hope to do myself the pleasure of calling.'

A very ungracious grumble about being very busy, and its being impossible for a doctor to say when he would be disengaged, rose to Dr Merridew's lips; but he contrived to swallow it, and to return a decently civil answer that he would probably be at home about three, and would be pleased to see Mr Moore, if he was kind enough to call. 'Confound the fellow!' he added internally—'a stuck-up Jack-a-dandy. I can't think what Sage can see to like in him; and if she says anything to me about him, I'll just tell her so.'

These were his sentiments going down the steps from the house into the street; and then Sage slipped her hand under his arm, while the others ran on in front, and he pressed the little hand tenderly against his side and said: 'Why didn't you tell me about it, little Sage?'

And she answered: 'I've wanted to ever so often; only, you know he went away without saying good-bye; and I did not know he cared; and I thought I should never see him any more.—Father, do you like him?'

'Well, my dear— Oh yes—of course, very much. You see, I've hardly had any opportunity'—

'Oh, father!'—reproachfully—'and he likes you so very much.'

'He likes you very much, Sage.'

'Do you think he does? Do you think he really can? It seems so impossible.'

'I can't say I see it in that light myself.' An ecstatic little squeeze of his arm. 'Are you happy, little Sage?'

'Happy? Father, I'm awfully happy—not just in the boys' slang; but really there's something quite awful in being so happy. It almost frightens one.'

'God bless you, little Sage.' And there being no one in sight along the street, he kissed her.

JOHORE TEA.

'WHERE is Johore?' we can imagine many people asking, who may have come across mention of the Sultan during his recent visit to Europe and America. Little as he may be known to Mr Morley's 'plain man,' the Sultan of Johore is recognised in official circles as one of the most enlightened and progressive of Oriental potentates, and as actively engaged in developing the resources of his little kingdom in quite a remarkable manner.

Johore is on those Straits of Malacca of which the late Lord Beaconsfield once uttered a mysterious foreboding on a memorable occasion; and it is now the only independent kingdom in the Malay Peninsula. In area it covers about fifteen thousand square miles, and its population is probably about two hundred thousand; and, roughly speaking, its borders are within about

fourteen miles of the British colony of Singapore, one of the Straits Settlements. It is bounded on one side by the other British settlement of Malacca, and on three sides by the sea. Yet small as it is, Johore is reputedly one of the richest native States in Asia, a fact in no way due to the circumstance that within its borders is a mountain supposed by some to be the Mount Ophir of the Bible, but which in modern times has not yielded much of either gold or tin, although both have been found at its base. Johore is particularly rich in its deposits of tin and of iron, and in its virgin forests of valuable tropical trees.

Since the Sultan Abu Bakar came to the throne, he has displayed great energy in experimenting on the productivity of the soil. What may be called the native products are tapioca, cocoa, sago, gambier, and various spices and gums, the gambier industry being chiefly in the hands of the Chinese, who now outnumber the aboriginal Malays. To encourage the industry, the Sultan has allowed the Chinese gambier-cultivators to have land rent free and untaxed so long as they cultivate it properly; and charges only a small export tax on the gambier and other products of their holdings. This is why the Chinese have settled in such numbers and have prospered so remarkably.

Not content with the native products, however, the Sultan has introduced the cultivation of tea, coffee, and pepper, with such success that they now form the chief products of the kingdom, and exceed in value the indigenous products. It is to the new Tea industry that we propose to devote a few words, because Johore tea is now being declared by experts to be superior in bouquet and flavour to the best qualities of Assam, and even Ceylon tea.

It is only within the last twelve years that tea-planting has commenced, the original plants having been hybrid Assam and China plants imported from India. At first it was extremely difficult to get suitable labour, and labour is an important item in a tea-garden, for the whole ground has to be dug over three times a year; and the bushes need constant tending. But coolies are now plentiful, and work cheerfully and well for about the equivalent of sixpence a day. The skilled labour is performed by Chinese, who, of course, are paid better.

The tea-plant needs a moist heat, and this the climate of Johore affords so abundantly that the plants flush, or throw out fresh shoots, all the year round. It is these young leaves that are plucked to make the tea of commerce. The bushes are planted in rows about five feet apart, with a space of about five feet between each bush. Each bush flushes about three times a month; and once a year it flowers, and is then pruned.

The work on the Johore gardens begins at daybreak, when at the sound of a horn, men, women, and children turn out of their homes to pluck the young leaves. The plucking is suspended at eleven o'clock, when a horn summons the pickers to the 'go-down,' to have their morning's work weighed. Payment is by results—so much per pound of leaf plucked—and each picker receives a ticket for the weight of his basket, less the weight of the basket itself. Then

at one o'clock the horn sounds again ; and plucking is resumed until five P.M., when comes another summons to the go-down, and another weighing with a fresh issue of tickets.

An industrious picker can, when the flush is good, pluck as much as sixty pounds' weight of green leaf in a day, and the best baskets are usually made by the women and children.

In the factory the green leaf is handed over to experienced Chinese operators, who first sprinkle the leaves over bamboo trays placed on elevated stands. This is to allow the leaf to wither, and during this process it is to be handled as little as possible. The process of withering is much affected by the condition of the weather, and it needs long experience to determine when it is sufficiently complete. The test is touch and colour rather than time, and this is where experience is valuable, for an inexperienced tea-maker may spoil much good leaf by premature or over-frequent handling.

When the leaves are sufficiently withered, they are placed in a box which holds about fifty pounds, to be rolled either with a hand-roller, or in large factories with a roller worked by steam. The box is given a sort of sliding motion, so that the leaf besides being pressed, gets twisted and rolled without losing its juice.

The rolling process occupies an hour ; and the next stage is fermentation. The mass of rolled leaf is taken out of the box and placed in heaps upon a bench, where it is turned over and over again by hand, until it gradually loses its original green colour and becomes copper in hue. This also occupies about an hour ; and then the coppery, fermented rolls are spread on trays of wire-gauze, and placed in a large drying chest—called a 'sirocco'—filled with air heated up to two hundred and sixty degrees Fahrenheit. Each sirocco will hold four trays, and these are placed at different levels. The first batch of leaf is placed on the top tray, and after a few minutes, is withdrawn, turned over by hand for a while, and then placed on the second tray, while the first tray is filled with a new lot. The operation is repeated until each lot has had four treatments, and is thus 'made.'

Of course this method is only adapted to the comparatively small gardens of Johore, and would be laughed to scorn in the great tea-factories of India.

After the tea is 'made,' it has to be sorted, and here again experience is everything. The crisp leaves are turned into cylinders made of wire mesh of different degrees of fineness. As the cylinders revolve, the tea in the top one works through the meshes, according to size, into the lower cylinder, and so gradually out of that. The meshes determine the grades, which are known as broken orange-pekoe, orange-pekoe, broken-pekoe, pekoe, pekoe-souchong, and souchong, the order of merit being in the order named. Rather more than one-half, probably about sixty per cent. of a making, will be souchongs.

Now comes the last stage, the weighing and packing. If properly made, one pound of 'made' tea ought to be yielded by four and a quarter pounds of green leaf, and this is the basis upon which the coolies are paid. After the weighing test, the tea has to be carefully tasted, to detect any signs of burning, bad rolling, or imperfect fermentation.

When it passes this ordeal, it is filled into wooden boxes of fifty pounds each, lined with lead, and soldered down ; but before this is done, the tea is passed rapidly through the sirocco again, in order to expel any superfluous moisture.

As quickly as the chests are closed they are branded with the mark of the garden, the description of tea, the number, and the weight. In due time they are sent to Singapore for shipment in 'breaks,' which is the equivalent of the Chinese 'chops'—parcels of given quality and brand.

Such is tea-making in Johore as at present conducted. The quality of the tea, as we have said, is being recognised as highly superior, especially for mixing with China teas. The Johore tea is remarkable for its strength, and is thus better for blending with more delicate teas than for drinking alone ; yet, when freshly and carefully infused, it is delicious.

The Sultan is doing everything to encourage this new industry in his dominion, and it promises to become a very important one, for the soil and climate seem eminently adapted to the cultivation of the tea-plant. By-and-by Johore will make more out of its tea than out of its tin, hitherto the chief source of wealth.

It was from a Sultan of Johore that we, some seventy years ago, received the island of Singapore ; and the present Sultan is well versed in English literature and has more than once visited Europe. He wears the Grand Cross of St Michael and St George, the Star of India, and several German and Chinese Orders. He has the reputation of being humane, enlightened, and refined, as well as progressive. His capital city, Johore Bharu, across the Straits of Malacca from Singapore, contains some twenty-five thousand inhabitants. He has a palace in Singapore, besides a couple of palaces in his own territory. He is a great lover of horses, is generous and hospitable, has a magnificent service of gold-plate, and is the proud possessor of diamonds valued at two millions sterling.

THE BURDEN OF ISABEL.*

By J. MACLAREN CORBAN, Author of *Master of His Fate*;
A Soldier and a Gentleman ; &c.

CHAPTER XL.—THE BURDEN ROLLS AWAY.

THAT evening Isabel had accorded Alan Ainsworth an interview, with the resolution to see him no more again for a long time ; they were in an *impasse*, she urged ; nothing could be done at present ; George was in a condition in which it would be mean and cruel to trouble him ; therefore, she pleaded that Alan should seek no more to see her until the situation was much more propitious.

'But, you see, dear heart,' said Alan, 'that our difficulty must remain locked so long as we keep back the key of it.'

'I know, Alan, I know !' said she. 'But, when I saw George looking so broken down with his journey, and so ashamed of his mistakes, how

* Copyright reserved in the United States of America.

could I say what I had meant to say? To beat down an already bruised spirit!—to add a crueler stroke, perhaps, than any he had yet endured!—no, I could not do that! And then to have it thought that I had said what I had said because he is a ruined man!

'No one who knows you, Isabel,' said he, 'would ever think that! The fear of that may be dismissed. No doubt, it will be painful to Suffield to hear what must be said. But after all, my own dear, it *must* be said—must it not?—and every day's delay makes the saying only harder. And there are critical operations which it is kinder to perform at once, however ill able a man may seem to bear them.'

'I suppose there are,' said she. 'I know it is said there are.—But it seems to me, Alan, that you have not much pity for George.'

'Don't say that, Isabel. If he loves you at all as I do, I know how terribly he will feel when he is told he must give you up. It will be like the very prospect—the pang!—of death! The world will seem to end!—the whole universe to rush to chaos!'

'Do you love me so much, then?'

'I love you,' said he, 'as I love my life.'

'But,' said she, with a spark of her old spirit, 'does not a true lover say to his mistress that he loves her better than life?'

'That, my sweetheart,' said he, 'is the nonsense, the hyperbole, of love. I wish you to live, and myself to live also, that we may live together; therefore, I love you as my life.'

'Yes,' said she. 'Give me your hand, that I may feel strong. Poor George!—I am a foolish, weak woman! I never thought I was!—Did you ever think I was?'

'You are not, my love!' said he. 'This is a very difficult and trying time for you!—it would be for the strongest woman! It is your strength—your true strength—that makes you feel and behave as if you were weak!—the strength of your affections, the strength of your pity for George, and the strength of your regard for your uncle and aunt!—Another woman without your strength of tenderness would disregard or sweep away these feelings, and, in her absolutely selfish weakness, appear strong.'

'Yes,' said she, 'I think you are right!—I hope you are!—Tell me, love, I am not weak, and then I shall be strong!'

'Let me help you in this,' said he. 'Let me go to George and ask him to release you. It is only right that I should do that, since it is I who have put you in the wrong with him!—with my obstinate folly in trying to make a position before I spoke to you!'

'It seems to me very mean,' said she, 'to put you as a kind of buffer between him and myself. I don't think I can do that, Alan. At any rate let me go to my aunt first and tell her all. Don't you think that will be best?'

'I think that will be a good thing to do,' he answered.

'She may be harder than my uncle would have been,' said Isabel; 'but she is a woman, and she may better understand—especially since she was not at all anxious, a year ago, that I should marry George. I will go to her to-morrow, then.'

'And you will tell her all that *must* be told—won't you?'

'I will.'

At that moment the maid-servant announced 'Mr Suffield,' and turning their heads, they saw George standing in the doorway. They held each other's hand. Isabel's impulse was to snatch her hand away; but Alan held it, and still held it tight as they rose together to receive George. The meaning of the situation was so unmistakable, that none of the three said a word for an instant. At length George spoke. 'May I ask you, Mr Ainsworth, to leave my cousin and me alone a little while?'

'I should like to have a word with you before you go, Mr Suffield,' said Ainsworth. 'I shall be in the dining-room.'

'May I sit down, Bell?' said George, when Ainsworth had gone.

'Sit, George! sit!' she exclaimed. 'Oh, why have you come out, weak and ill as you are?'

'My father told me,' said he, 'something under which I couldn't rest: I had to get up and come to you, Bell! He suspects I have made another mistake!—that I have got you to promise to be my wife, without getting your proper love! Is that true, Bell? Answer me, dear!'

'I have done you a great wrong,' said she. 'I have committed a blunder—a shameful blunder—for which I ought to be punished. I am ashamed of myself, George, and—I have to ask your forgiveness!'

He looked on her with uncontrollable longing and pain; but he said nothing.

'I have led you to believe,' she continued, 'that I loved you enough to marry you!—I love you, George; but not enough!—not in that way!—not as you ought to be loved by a wife!—But if you wish me to keep my promise, I will keep it!'

He still had his eyes fixed on her: but he said nothing. She slipped to her knees by him and hid her face on his knee, while she took his hand. He drew his hand quickly away—it was the only sign he gave of resentment—and they remained thus silent for some moments.

'It is Ainsworth?' said he, at length.

'Yes,' she answered.

There was another pause; and then he put his hand in Isabel's: she kissed it.

'You forgive me, then?' said she, raising her eyes to meet his.

'Forgive you, Bell?' said he quietly, though there was a fevered light in his eye. 'We won't use that word. I am sure you meant me only kindness!'

'I did, George!—I did!'

'It has been all a mistake, I can see,' he continued. 'It is a good thing that this has happened now. If it had happened a month ago, I don't know how I would have taken it! I take it now quietly, you see,' he said with a wry smile.

'Oh, don't, George!' she exclaimed. 'Don't talk so bitterly!'

'It is bitter to lose you, Bell,' said he—'but, no; I won't complain! I had no business to think of marrying!—I was no more than a conceited boy fresh from school!—I have discovered I am only a boy!—not fit to be trusted with anything!—And when I am well, I am going to make a new start!—as you will, Bell!'

'And you will let me be good to you, my poor George!' said Isabel.

'For Heaven's sake, don't pity me, Bell!' he exclaimed. 'I can't stand it!—Give me one kiss, Bell!' She kissed him: now that she felt the close bond that had bound them was dissolved, she could do that without reluctance. 'It is over!' said he.—'But, Bell, you mustn't ask me to see him yet awhile!—Tell him I understand what he would say!—I don't blame him!—but I can't see him!'

And so in haste he took his hat and went away. Isabel turned to find Ainsworth in the dining-room.

'It is over, Alan,' said she, when she had delivered George's message. 'And I feel mean and ashamed. Please leave me, dear. I cannot bear to talk now!'

And he also went away, and left Isabel alone.

Next day she went again to Rutland Gate, desperately resolved to have her way with her uncle in the matter of the money. He was out—gone to see the Padiham agent about the surrender of the house—but her aunt was in her room, and sent word that she wished to see her. Isabel found her emptying boxes and wardrobes preparatory to the migration to Lancashire. She blamed Isabel for having almost frightened the life out of her, when she had found her son had gone out the previous night; and was in a generally resentful mood.

'It is strange, Bell,' said she, 'that you should not have known your own mind when you gave George your promise!'

'It was my own heart I did not know, aunt.'

'Mind or heart, it comes to the same thing.'

'I deceived myself. I thought I could marry George without the complete love you should have for the man you will spend your life with.'

'Fiddle-de-dee!' said her aunt impatiently. 'What should a girl know of the complete love you talk about?'

'The nature God has given you,' replied Isabel, 'will tell you that, if you are not too foolish to understand it.'

'No, it won't, Bell,' said her aunt—'however hard you listen. Only being in love can teach you that—if not with one man, then with another. And you have known Alan Ainsworth long enough, and surely you have known him well enough, to have understood all about the necessity of your complete love before you gave your promise to George?'

'I did understand,' said she humbly. 'But I thought he did not care for me. He was only holding back because of my wretched money, and because he wanted to make a position of his own first!—Why are you so hard, aunt? Why do you make it so difficult for me to tell you about it?'

'Hard, Bell? You talk like a silly girl! If I am hard, it is because I am a woman and can understand! I do not blame you for having fallen in love with Mr Ainsworth; I blame you for getting yourself engaged to my son, while you were really in love with the other man! It is for that I blame you!'

'I am to blame. I do not seek to excuse myself. But I cannot help thinking, aunt, that if George and I had got engaged to each other a year ago, you would have been very glad to hear we had broken the engagement off as quickly as now!'

Her aunt looked at her angrily; but Isabel endured the look, and it fell.

'You are a wicked girl to think so!—much more, to say so!' said her aunt.

'And why, aunt,' said Isabel, 'is it wicked to speak the truth? It is not always kind or right to speak the truth, but you have driven me now to speak it!'

'Driven you? Because I have said you were to blame for engaging yourself to my son when you cared for another man? Because I feel for my son when you have bruised him when he's already crushed?'

'No, aunt! It is not that!—it is not that!—It is none of these things! You know it is not! It is that you are hard and unsympathetic! You are a woman, and a mother; you feel for your son, but you feel nothing for me!—you do not care what may become of me!—And do I not feel for George? The pain of the pain I must give him has been upon me for days and days!—But you do not understand! You do not care to understand!—You are not interested in me! You never were! You never loved me, aunt! Never!'

'You were always a rebellious child, Bell!—And now you wag an ungrateful and wicked tongue!'

But Isabel was now stricken with distress. Her strained feelings had given way and produced these jangling plaints, and she trembled with the excitement of them.

'Forgive me, aunt!' said she. 'It is indeed wicked and ungrateful to talk to you like that!—I don't know what has come to me!—But, oh, you do not know what I have endured for days!—Forgive me, dear!'

She impulsively embraced her aunt, who leaned her head on her shoulder and wept.

'Oh, wicked, wicked creature that I am!' cried Isabel.—'But why, dear, why were you so hard with me? Why would you not understand how it had come about?'

And these two women embraced and kissed each other, and understood each other better in that hour than they had all their lives before.

'I must see Uncle George,' said Isabel, when the emotions of both had been assuaged somewhat. 'I wonder if he is come in?'

Her aunt made inquiry; found he had returned, and told Isabel he was waiting for her in the library.

'Well, my lass,' said he, when she had entered the library and he had closed the door.

Her self-control gave way utterly, and she threw herself sobbing into her uncle's arms.

'There, my lass!—there!' he murmured, patting her shoulder. 'Thou'rt wi' thy owd uncle, and he cannot find it in his heart to blame tha!—Though 'twould ha' saved a lot o' trouble and cryin' if things had gone straight for'ard, instead o' comin' right in this hind-foremost kind o' way. But it's come right now, and we mun be as good friends as ever. Ainsworth's a good lad; and if you love him and he loves you, you're both set in th' right way.—And George, of course—well, George has got to open a new account all round: that's only right, after all.—Well now, my lass, about this money. Sit tha down, and let's ha' it out.'

'You must take it, uncle!' said Isabel, drying

her eyes. 'Please! If you want me to live happily, you must take it!'

'Suppose,' said Suffield, 'I take the money over and pay thee a percentage?'

'No, no, uncle!' she cried. 'It must be yours wholly and entirely!—I never want to see any thing of it again, or to hear of it!'

'It's queer,' meditated he, 'how thou dost hate that money! I wonder now if there was anything odd about th' way Harry got it?—However, thou sayst a percentage won't do. No.—But what, lass, if this money should be as unlucky to me as it has been to thee?'

'It won't be, uncle!' said she. 'It cannot be! You are a good man, and you will use it well and wisely!'

'I don't know,' said he, 'that that'll make any difference. Nevertheless, I suppose I must risk it.—But what the dickens,' he demanded, 'art tha going to do without it?'

'I suppose,' said she with a deep blush, 'we shall be married soon.'

'Of course, of course,' said her uncle. 'And he wants tha to g'v'e this money up?'

'He does, of course,' answered Isabel.

'Ah, he's young yet,' said he—'he's young.—But what about thy father's keep at that place?'

'We hope he needn't stay longer than the year; but in any case Alan wishes to pay it.'

'And thy Aged?'

'Among us we will manage that too—Alan and others.'

'Seems to me,' said her uncle, 'that's rather hard on Alan. A man might as well start wi' a family. Howsoever, these things'll get his hand into th' way o' extra expense: they'll be o' use to him that way.—Well, I suppose, thou must ha' thy way wi' thy owd uncle, as thou always did.'

'Dear uncle,' said she, 'how kind and indulgent you have always been!'

'Well, lass, I'll take this over for two or three years. By the end o' that time thou'll ha' learned th' value o' money better, wi' one thing and another, and may be glad to ha' it back.'

'Never, uncle—never!' she protested. 'You must take it for good and all, for better or worse.'

'Well, Isabel, my lass, I never was so unwilling to do anything for tha. But thou wilt ha' thy way.—I'll tak' and use th' money till thou dost ask for it back.'

'If I am wilful, uncle,' said Isabel with a smile, 'you are obstinate. But let us leave it as you say—leave it till I ask for it back.—I am really very grateful to you, uncle! You have done me a great favour! You have taken a terrible load off me!—Just then, a beam of the afternoon sun passing by the lofty and supercilious lords of Paliham, shed its gentle, wintry radiance on these two.—'It is a good omen!' exclaimed Isabel. 'Say, uncle dear, that it is!—Forgive me all the wrong I have done!'

Suffield was moved. He said nothing; but he put his kindly hand on his niece's head; and there was blessing in the act.

'How is it you two always get on so well together?' said Mrs Suffield, who entered at that moment.

'Tha knows, Bell,' said Suffield, taking his

wife's hand, 'I believe she begins to be jealous in her old age.'

'Old age!' exclaimed his wife. 'Speak for yourself, George!'

Isabel went to her aunt and embraced her. 'You forgive me, then?' she murmured.—Her aunt's answer was a caress and a kiss.—'I will come again before you go,' added Isabel—'to see Phemy.'

And thus in mutual forgiveness and reconciliation ended the stress and storm which with minds less just and generous and hearts less tender and true might have resulted in estrangement and hatred.

BUNHILL FIELDS.

NEXT to Westminster Abbey, there is perhaps no place of sepulture of such historic interest in the British Isles as Bunhill Fields; for there lie two men who in their writings have appealed as widely to English hearts as any who rest within the great Abbey—John Bunyan and Daniel Defoe. If John Milton lay with them, whom, as an Independent, we should expect to find in this the 'Campo Santo of the Dissenters,' the spot would indeed be very sacred. He rests, however, not far off, in the little church of St Giles, Cripplegate. Yet the locality of Bunhill Fields is indissolubly linked with the closing years of the poet, and it will therefore do no violence to the fitness of things to start on a pilgrimage to the burial-ground, as the writer did, from the spot first associated with Milton, namely, Bread Street.

Bread Street is now a narrow thoroughfare of warehouses running from Cheapside into Queen Victoria Street, crossing in its course Watling Street and Cannon Street. Bread Street 'is thrice blessed' with literary associations. Here Milton was born; from this street the 'Mermaid Tavern,' haunt of Shakespeare and Ben Jonson and of many others, had its chief entrance; and in St Mildred's Church, still standing at that corner where it meets Cannon Street, Shelley married Mary Godwin. The Great Fire swept away birthplace and church (All-Hallows) of Milton's baptism; but it is known that the 'Spread Eagle,' the house of his nativity, once occupied the site of the present row of warehouses known as '58 to 63 Bread Street.' The firm who are now in possession have placed a bust and inscription in an upper room. Th' house is two or three doors down the left side of Bread Street from the Cheapside end.

Crossing Cheapside, we make our way up Wood Street, a street opening almost opposite to Bread Street. This, too, is classic ground. Here that curious compound of worldliness and otherworldliness, Robert Herrick, poet and divine, was born; and this long and somewhat uninteresting street Wordsworth has made musical for ever with the song of the thrush which he heard 'at the corner of Wood Street.' Long though it is, it has an end, and its end is in Fore Street.

A few steps and the name Milton Street recalls our starting-point, but only by its name. It is the modern disguise for Grub Street, the miserable warren where the pamphleteers of the seventeenth and eighteenth centuries had their

burrows. Fox, probably the most respectable literary dweller ever in that unsavoury region, wrote his 'Book of Martyrs' here—but that was before its notorious days; he lies with Milton in St Giles, the church of which he was incumbent for a short time, where, as Aubrey says, 'I ghesse Jo Speed and he lie together.' The new name was obviously suggested by its proximity to the street into which we now pass, so hallowed by memories of Milton, Bunhill Row.

The familiar Artillery Walk, Bunhill Fields, last earthly home of the poet, we look for in vain; but careful search has very reasonably identified a spot not far from this southern end of the street, and on our left hand, as the former site of Milton's house. Here 'Paradise Lost,' 'Paradise Regained,' and 'Samson Agonistes,' were dictated to the three suffering and rebellious daughters; and here 'an ancient clergyman of Dorsetshire found the poet, dressed neatly in black; pale, but not cadaverous; his hands and fingers gouty and with chalk stones.'

Bunhill Fields Cemetery, when Milton was led, blind, through the Row, had hardly become the recognised burial-place of the Nonconformists; for we cannot but think the poet would have willed that his bones should lie with those of his brethren, had he known that within a few years the bodies of the blessed dead, of John Bunyan, of John Owen, of Daniel Defoe, of General Fleetwood, and of some fifteen of the Cromwell family, would be laid to rest here. The ground, which we enter from Bunhill Row, is well planted with trees, and is neatly kept by the beadle who guards the sacred enclosure—a straight causeway, paved with broad gravestones, leading across the Fields to City Road; little gateways in the iron fence allowing the curious and the wearied to wander or rest among the tombs. The graves lie close, so close, indeed, that there is little room for flower-beds, and yet the stones commemorate only six thousand of the one hundred and twenty-four thousand bodies crowded within this little space of barely four acres. Close by was the Great Plague Pit which Defoe describes in his semi-apocryphal History. At a rough calculation, bodies must lie in strata to a depth of some ten or fifteen feet beneath the surface; for the tombs of Fleetwood and of Henry Cromwell were discovered seven feet below the surface. The history of the preservation of the Cemetery from the irreverent encroachments of warehouses and the desolating hand of 'improvement' is almost romantic. Too long to relate here, suffice it to say that the loving care of faithful Nonconformists, with the co-operation of the Corporation of London, secured in 1868, by special Act of Parliament, the guardianship of the historical spot to a Committee of the latter for ever. Closed as a burial-ground in 1852, it then completed the roll of its mighty dead; its doomsday book now lies in twenty-seven volumes upon the shelves of Somerset House, among the Nonconformist Registers. The earliest date on any stone is on that of Debora Warr, Nov. 10, 1623; but as it is possible that this may be but an instance of re-interment from a neighbouring ground, the year 1665 is probably the earliest date of a burial.

When we pass into this God's-acre, the first tombs we instinctively seek for are those of

Bunyan, and of that other great idealist, Defoe. Defoe's monument is modern; Bunyan's, the restored form of the original; Defoe's, a granite obelisk, erected in 1870 'By the Boys and Girls of England to the Memory of the Author of "Robinson Crusoe";' Bunyan's, a somewhat elaborate sarcophagus tomb, upon which rests an effigy of the 'inspired tinker'; on either side a medallion, one representing Christian escaping from the Slough of Despond, the other, the falling-off of the burden from the shoulders of the Pilgrim, and at one end the inscription, 'JOHN BUNYAN, Author of "Pilgrim's Progress," ob. 31st Aug. 1688, æt. 60. Restored by public subscription, under the Presidency of the Right Hon. the Earl of Shaftesbury, May 1862.' Both inscriptions pleasing in their simplicity, and in their contrast to the fulsome legends on many a surrounding tombstone. In Bunyan's grave is buried a Mr Strudwick, in whose house, on Snow Hill, the great writer reached the goal towards which, as a pilgrim, he had been journeying during his sixty years.

Perhaps in popular interest, if not in literary, the grave of Isaac Watts would rank next. Watts lived from 1713 to 1748 with a Sir Thomas and Lady Abney at Theobalds, in Hertfordshire; and afterwards at Stoke Newington, where he died in the latter year. Like that of Dr Johnson in the house of Mr and Mrs Thrale at Streatham, the presence of this good man was never deemed burdensome by his host, though his visit extended over thirty-five years! Here he probably wrote many of his familiar 'Hymns,' although it is known, from his own statement, that he published poems in 1705. Another popular hymn-writer, Joseph Hart, who died in 1768, also rests in Bunhill Fields.

The family most numerous represented in this burying-ground is that of Cromwell. The appearance of the names, upon two plain altar tombs, of Richard and of Henry Cromwell, at first sight would seem historically more suggestive than afterwards proves to be the case. For this Major Henry Cromwell was but the grandson of the Lord Protector, son of that Henry who was Lord-lieutenant of Ireland, and who died in 1673, and lies buried somewhere in Cambridgeshire. It is hard to say what relationship this Richard Cromwell bore to the leader of the New Model Army; at all events, he was not the Richard who succeeded the Protector. No fewer than eleven, perhaps twelve, of the family are buried beneath this one tombstone. Not far from the Cromwells' tomb is buried a more interesting connection of the family, General Fleetwood, who married the eldest daughter of Oliver Cromwell. By this marriage, as is well known, he doubly bound himself to the fortunes of the Independents, for Dame Bridget Fleetwood was Dame Ireton before her second marriage, being the widow of Cromwell's trusted colleague, Lord-deputy Ireton. Another of Cromwell's officers, Lieutenant-colonel Kiffin, lies here in an unidentified grave, whose daughter was the wife of that Major Henry Cromwell whose family vault we have just visited. So the Cromwells and their connections fill no small space in this City burial-ground.

Amongst the names of the many Nonconformist divines, perhaps those of John Owen, D.D.,

Nathaniel Lardner, D.D., and George Burder, are most familiar. Owen, as a sentence in the long Latin inscription declares, with some obscurity as to its exact meaning, 'in divinity, practical, polemical, and casuistical, excelled others, and was in all equal to himself.' He died in 1683. Lardner's two chief works, 'The Credibility of Gospel History,' and 'Ancient Jewish and Heathen Testimonies to the Truth of the Christian Religion,' are named upon his tombstone; and as appropriate to his Christian name, the inscription closes with the exclamation, 'An Israelite indeed, in whom is no guile.' Born the year after Owen's death, he departed this life in 1768. The familiar collocation of the words 'Burder's Village Sermons' is perhaps all that now perpetuates the memory of the divine who, born so far back as 1752, lived well into the year of Lord John Russell and the Reform Bill.

The surname of Thomas Doolittle, M.A., preserved amongst the twenty-seven volumes in Somerset House—for his grave is unidentified—certainly belies the man; for his sermons were of appalling length, one alone filling two hundred and fourteen pages of a good-sized volume, and in delivery demanding the attention of an audience for the space of some three hours and a half!

Of Thomas Bradbury, another divine, an amusing story is quoted in the admirable little guide-book printed by the City Lands Committee of the Corporation of London. He claimed to have been the first man in the kingdom to have announced publicly, as he did from his pulpit, 'Queen Anne is dead;' and under the following circumstances. Bradbury was a keen anti-Jacobite, was constantly dreading a return of persecuting days, and counted with somewhat indecent impatience the moments until the Protestant succession was secured to the throne of England. Crossing Smithfield on the morning of that Sunday in August 1, 1714, when Queen Anne breathed her last, ruminating sadly on the thought that he might be called upon at no distant date to prove his resolution and constancy, as the noble company of martyrs had done on that very spot, he met the Bishop of Salisbury, Gilbert Burnet, the well-known author of the 'History of his Own Time.' The Bishop, whose sympathies, as far as the House of Hanover was concerned, were quite in accord with Bradbury's, cheered the despondent Nonconformist with the intelligence that the queen had been given over by her physicians, and that he, Burnet, was on his way to court to ascertain all particulars. The Bishop seems to have been quite as anxious that Bradbury should have possession of the latest bulletin, as Bradbury was himself, and the following ingenious plan was proposed. Fearing lest Bradbury should be in the middle of his sermon when the messenger whom the Bishop promised to despatch should arrive, it was arranged that if the news was as they both hoped, a handkerchief should be dropped from the gallery by the messenger. Sure enough, when Mr Bradbury was preaching, the signal was seen fluttering down upon the head of some perchance slumbering member of the congregation; and so led to the announcement. Bradbury finished his sermon; in his closing prayer returning thanks for the deliverance of these kingdoms from the evil counsels

and designs of their enemies, and imploring a divine blessing upon 'His Majesty King George and the House of Hanover.'

The Preservation Committee have had inscribed upon the gate-pillars of the City Road entrance the names of the most distinguished who rest within. A singular clerical error occurs in the case of one familiar name, 'Samuel Wesley' appearing in mistake for 'Susannah Wesley.' The mother of John, Charles, and Samuel Wesley, and of sixteen other children, does indeed lie here, but Samuel does not. The inscription, on a very plain tombstone, records how that 'here lies the Body of MRS SUSANNAH WESLEY (widow of the Rev. Samuel Wesley, M.A., late Rector of Epworth, in Lincolnshire, who died July 23d, 1742, aged 73 years. She was the youngest daughter of the Rev. Samuel Annesley, D.D., ejected by the Act of Uniformity from the Rectory of St Giles's Cripplegate, August 24th, 1662.' Close by, across the City Road, stands the house (No. 47) in which John Wesley lived when incumbent of the City Road Chapel, of which he laid the foundation stone in 1777. He died in the same house, and his grave is in the little burial-ground behind the Chapel. It is not commonly known that under a flagstone in the cloisters of Westminster Abbey four children of Samuel Wesley, described as 'brother to John Wesley,' rest.

But the time would fail to tell of the many whose names we recognise as we wander through the grounds: of John Eames, F.R.S., personal friend of Sir Isaac Newton and Isaac Watts: of Lady Erskine, sister to Lord Chancellor Erskine: of Thomas Hardy, enlightened patriot, who suffered imprisonment in 1794 as a promoter of Radical Parliamentary Reform, but who lived to see his principles become law in the Reform Bill of 1832: of Joseph Hughes, founder of the British and Foreign Bible Society: of John Morley, whose 'high honour and inflexible integrity' were perpetuated in his son, the late Samuel Morley, M.P. for Bristol: of Hugh Pugh, the famous Welsh Harpist: of Thomas Stothard, R.A., the painter, whose illustrations of 'Robinson Crusoe' are dear to children and adults: and of many another. Two famous names we read upon the pillars, whose graves are unidentified: those of Joseph Ritson, F.S.A., the notable antiquary; and of William Blake, poet and painter. There is something in keeping with the life-history of this eccentric but inspired genius that oblivion should have closed over the exact spot of Blake's grave, one whom the world called mad.

Finally, Bunhill Fields is not without its quaintly worded inscriptions and examples of extravagant panegyric. Of the latter class, we commend the reader to the legend on the stone of a Dr Henry Hunter, for thirty-one years pastor of the Scots Church, London, as an admirable specimen. In it occurs the following remarkably modest statement: 'His best eulogium and his most durable memorial will be found in his writings, which the revolutions of years cannot efface; and when the nettle shall skirt the base of this monument, and the moss obliterate this feeble testimonial of affection—when, finally sinking under the pressure of years, this Pillar shall tumble and fall over the dust it covers, his name

shall be perpetuated to generations yet unborn.' Curiously enough, the Henry Hunter who is thus panegyricised was a native of Culross, on the Firth of Forth, and at one time minister of the parish of South Leith, before going to London. He died in 1802. The 'Sacred Biographies' and 'Sermons' published by him are probably now quite forgotten; and of his numerous volumes of translations, perhaps the only ones now known to book-hunters are the five which contain the text, with eight hundred engravings, of Lavater's 'Physiognomy,' published 1789-98, the original price of which was thirty pounds sterling.

As belonging to the quaint species of epitaph, the monument to a certain Lady Page may be cited. It contains the following extraordinary piece of information:

Here lies DAME MARY PAGE,
Relict of Sir Gregory Page, Bart.
She departed this life March 11, 1728,
In the 56 year of her age.
In 67 months she was tap'd 66 times,
Had taken away 240 gallons of water
Without ever repining at her case,
Or ever fearing the operation.

A TALE OF THE KARROO.

ACROSS the red, sandy karroo came 'trekking' a huge, lumbering Cape wagon, drawn by a span of sixteen oxen, which were continually urged on by the 'vorloopers,' two Kaffir lads. At the front of the wagon, beside the Kaffir driver, sat James Rockhurst, a big, black-bearded fellow of thirty-five or forty, whose once handsome face was sadly disfigured with the marks of many a scrimmage, for he had lived and fought in almost every rough corner of the globe. He had been a cowboy in Texas, a gold-seeker on the Pacific slope, a stock-rider in the Australian Bush, and goodness knows what beside; but, like the rolling stone that he was, he had gathered no moss. He had been drifted by the tide of circumstances to South Africa, and was now crossing the Great Karroo in the hope of getting a job on the ostrich farm of a distant relative.

By the side of the wagon rode another Englishman, on horseback. The rider, who was roughly dressed, was young—not much over thirty—and was an average specimen of the Cape colonist, with skin bronzed to a deep hue. He was singularly reticent about his personal affairs; and although the two men had now travelled in company for a couple of days, Rockhurst knew practically nothing about his companion save that his name was David Grant, and that he was last from the Transvaal. But although silent on one subject, Grant was by no means a bad companion. Occasionally he would gaze thoughtfully over the great rolling 'veldt,' and a wistful look of yearning anticipation would come into his eyes; but on the whole he was a pleasant fellow, and as mile after mile of the rough track was steadily covered, his laugh grew cheerier, his spirits rose higher, and, unconsciously, his fingers sought oftener than before the leathern belt strapped round his waist under his vest. This nervous action betrayed him, for Rockhurst's lynx-like eye took in his every movement.

'Diamonds!' quoth Rockhurst to himself, and his eyes glistened at the thought. All that fore-

noon as they trekked beneath the blazing sun; at noon, too, when they 'outspanned' for a couple of hours by the dams of a farmstead, the word was uppermost in his mind. Mr James Rockhurst's moral code was not of the highest, and his notions of right and wrong were peculiarly convenient.

That evening, the travellers halted for the night by the side of a 'sluit,' down which trickled a tiny stream. The Kaffirs made a fire, and over it the rude supper was cooked. Then the two white men, having smoked their last pipes, stretched themselves upon the 'kartel,' or hanging bedstead, inside the wagon; while the blacks got hopelessly drunk on a bottle of 'Cape smoke' they had procured at the farm where they had outspanned at mid-day.

About midnight, Rockhurst raised himself cautiously to a sitting posture and listened intently. His companion's regular breathing told him he was sleeping that sound sleep which follows a day in the saddle; and the loud discordant snores that came up through the floor of the wagon assured him that there was nothing to fear from the Kaffirs who lay beneath, stupefied by the vile stuff they had debauched themselves with. With as little movement as possible he drew the curtain of the wagon aside. Outside, the great full moon had turned the veldt into a plain of frosted silver. The glorious Southern Cross, too, looked down upon the tranquil scene, that was strangely out of harmony with the wicked thoughts that thronged the watcher's mind. The oxen lay contentedly near, and Grant's horse stood motionless, silhouetted against the fairy background, tethered to the stump of a prickly-pear. A moonbeam strayed in through the parted curtain and played softly on the sleeper's smiling features, as Rockhurst bent over him, his hands fingering the belt that encircled the prostrate figure. To one side of the girdle was fastened a small pouch. This the marauder detached and slipped into his own pocket. As he did so his unconscious victim stirred a little in his sleep and murmured 'Maggie;' but he did not wake.

'The fool is dreaming of his sweetheart,' muttered Rockhurst *sotto voce*, as he swung himself gently from the 'kartel,' and picking up the saddle from the floor, quietly left the wagon. Stopping for a moment outside to open the pouch and make sure that it contained what he expected—a few rough pebbles, diamonds in their 'gang'—he unhitched the horse, led him carefully a little distance beyond the wagon, saddled him, and springing upon his back, quickly disappeared over the moonlit plain. All that night the guilty man urged on his beast, keeping to the track as best he could. All the next day, too, he pushed on, stopping twice at lonely farmsteads to bait the horse and procure food for himself. He was no connoisseur of diamonds, and could not form any idea of the value of his plunder, but he judged that it must be worth some hundreds of pounds. He had got a good start, and he meant to keep it. The programme that evolved itself in his brain was this: He would make direct for Graaff Reynet, at which place he expected to arrive at least a couple of days before any information of the robbery, for news travels slowly over the veldt. There he

would take the train for Port Elizabeth, leave the cars before they got to their destination, and make the best of his way across country to East London, where he could ship to any distant port whither a vessel might be on the point of sailing.

Full of this determination, he spared neither himself nor his steed, and that night drew rein at a solitary farmhouse from one of the windows of which shone the light of a candle. The appearance of the homestead did not give one the idea that the tenant was blessed with a superfluity of this world's riches. The squat, mud-built dwelling-place was small and ugly, and the kraals and outbuildings were few and scanty. Nevertheless, Rockhurst determined to stop and beg for a night's quarters. Dismounting, he approached the house, and peered anxiously into the lighted room through the uncurtained window; but the sight he saw was far from the comfortable scene he expected. On a low settle, which had been transformed into a bed, a sick child—a little girl—of three or four years of age moaned wearily as she tossed restlessly in her feverish slumber; while in a chair in front of the dying embers in the grate a pale wan woman, haggard and hollow-eyed with long watching, sat lost in that deep oblivion which only overwrought nature can give.

'Smallpox!' exclaimed Rockhurst, recognising the symptoms of the loathsome disease on the face of the little sufferer. 'Bad, too! I'm getting out of this as sharp as I can—even if I have to camp out on the veldt all night;' and springing once more into the saddle, he urged on the jaded beast. But however much he tried, he could not rid himself of the sight of that little face disfigured with the fatal blotches. Suddenly he turned his horse's head. Something drew him back to the farm. A second time he approached the lighted window and peeped in. The sash was open at the top, and as he stood watching the pathetic scene, the parched lips of the tiny patient moved and faintly lisped: 'Mammy, want a drink!'

A jug and a cup stood upon the little table; but the woman in the chair was deaf to the plaintive voice. For four days and nights she had watched unremittingly by the sick couch; now her strength had failed; sleep had overcome even a mother's devotion; and it is doubtful whether anything short of an earthquake would have aroused her just then.

'Mammy, want a drink—want a drink, mammy—inam-my!' came again, still more faintly, from the settle.

In the moonlight, something suspiciously like a tear glistened in the corner of the hardened scamp's eye as he hitched his horse to a ring in the wall of one of the outhouses and turned to the door. No bolts stopped him, and, raising the latch, he stepped straight into the little room. With clumsy fingers, trembling with a strange emotion, he poured out the cooling drink and held the cup to the discoloured lips of the little sufferer. The child swallowed the draught eagerly, and then lay motionless for a few minutes before beginning to toss and moan as before. Next Rockhurst raked together the glowing embers, heaped on more fuel, and snuffed the candle with his fingers. Then he gazed round

the small apartment, and spying a box under the table, he drew it up to the hearth and set it opposite to the sleeping woman. Wrapping up the child in a blanket, he lifted her from the settle, and with his precious burden in his arms sat down on the box. As he swayed gently to and fro, the moaning grew fainter and less frequent, and finally ceased as the little one, without opening her eyes, turned her face towards him and snuggled closer to his rough breast. The crisis was past; and, thanks to Rockhurst's timely attentions, a peaceful, health-giving slumber had come to the child.

On and on through the long dreary watches of the night the woman slept soundly; and no less securely did the child rest cradled in the arms of her rough-handed nurse. The candle burnt down into the socket and went out with a splutter, and still the man sat motionless in the flickering firelight, for fear lest he should awake his charge. The moon sank beneath the western horizon, the stars faded and the dawn appeared, and just as the rim of the rising sun became visible above the veldt, the woman stirred in her chair and awoke with a start. 'Oh, my child—my poor darling!' she exclaimed in an agony of alarm. Then her eyes fell upon the stranger, and a look of helpless bewilderment came into them.

'Hush!' said Rockhurst; 'the kid's all right. See! she's sleeping soundly.'

'Thank God!' cried the woman, as the tears rolled down her cheeks. 'I must have fallen asleep. I—Oh! how could I ever forgive myself if any harm had come to my little one—my precious Lisbeth? But you, sir—how did you come here? Are you a man or an angel in disguise?'

At this, Rockhurst smiled grimly, the woman's surmise was so *very* wide of the mark. Nevertheless, it made him feel decidedly uncomfortable. 'No; I ain't no angel, marm, as I know on,' he replied; 'I'm only a poor traveller, who saw your light, and came to beg a night's shelter. I peeped in at the window and heard the kid ask for a drink; so I just stepped in and gave it one, and thought as how I might as well stop till you woke up. So, you see, it's only by chance I happen to be here.'

'No, don't say that,' cried the woman; 'say, rather, that God sent you. Oh, how can I ever thank you and Him? If it had not been for your coming, my poor little Lisbeth might have died!'

'Now, don't you take on so, marm—don't say nothing about it,' replied Rockhurst huskily, as he handed her his burden. 'I don't want your thanks; but I'd be much obliged to you if you'd give me a mouthful of something to eat and a feed for my horse, and then we must be jogging again.'

The mother laid her sleeping child tenderly upon the couch, and then bustled out intent on hospitable matters. Soon she returned with food, and placed it before the hungry man, who fell to with ravenous appetite, while his hostess went off to rouse one of the Kaffirs to attend to the horse. While she was absent, the man's eye fell upon a book which lay open upon the table. He drew it towards him, and mechanically turned over the pages until he came to the fly-leaf, upon which

was written in a bold hand the name 'David Grant.' The cake he was conveying to his mouth with the other hand fell untasted from his lips. Good heavens! could it be possible? Was he eating the bread of the man he had robbed? Could this be?— There was not time for further conjecture, for at that moment the woman re-entered. Her maternal anxiety led her first to the couch to make sure that her child was all right. This gave the man a little time in which to recover himself; and when she turned round, he asked, with assumed carelessness, as he pointed to the name on the fly-leaf: 'That your husband, marm?'

'Yes; that is my husband—my David,' she replied, with a smile that spoke volumes. 'I am expecting him home every day. Won't you stay until he comes and can help me to thank you for what you have done for our only child?'

'No; I must be on the move directly,' Rockhurst replied. Then he added, quite casually: 'Husband been away long, marm?'

'Twelve months—twelve long, weary months,' she said, with a sigh. 'You see, it was like this. Things were bad on the farm. We had made little or nothing for three or four years. Then came the dreadful drought. The water in the dams ran short; the well gave out, and we lost nearly all our stock. That decided David. He gave up all hope of making money at farming, and determined to try his luck at the Diamond Fields. It is just a year since he left for Kimberley, leaving me and old Grierson, the overseer, to look after what little stock we had during his absence. I didn't try to stay him, although the parting well-nigh broke my heart, for I knew that his mind was set upon it. His letters, sometimes hopeful, sometimes desponding, have been my comfort during his absence. At first, things went against him; but at last the luck changed, and now all the weary waiting is over, and I shall soon have him at home again. He doesn't know his child is ill—he doesn't know how I have sat hour after hour by her side, watching the flickering spark of life, and not daring to think—afraid even to hope. But now the worst is past; little Lisbeth will soon be well and strong again; David—my David will be with us; and we shall all go to England, to settle down in the old country on the results of his labours at the Diamond Fields. Now, do stay—do, I beg of you. David will be so vexed when he learns what you have done for us—how, probably, you have saved our darling's life—if he cannot thank you. He will be home, perhaps to-morrow—to-day.'

Great beads of sweat stood on Rockhurst's brow as he listened to Maggie Grant's words. When she had finished speaking, he rose and paced thoughtfully to and fro across the little room, while the woman looked on wonderingly. Suddenly he stopped, faced about, and drawing the leather pouch from his pocket, flung it upon the table. 'Dash it! marm,' he cried; 'I can't stand this no longer. When your husband comes home, tell him I brought on his horse and his diamonds and delivered 'em safe;' and with these words he snatched up his hat and strode out of the door.

A faint glimmer of the truth broke in upon the astonished woman. Still, what were all the

diamonds in the world compared to the life of her child? 'Come back!—come back!' she cried, hastening after him. But Rockhurst only quickened his steps. And murmuring 'God bless you! Heaven will reward you!' she stood and watched him out of sight.

But he never reached Graaff Reynet. The fatal sickness, caught from little Lisbeth Grant, was already insidiously at work within him, and the hand of Death was even then upon him. After two or three days' weary plodding, his strength gave out, and he laid himself down upon the veldt to die. It was here that David Grant found him, and took him back in a wagon to his farm. It was Maggie Grant who spoke the soothing words of comfort that sank into the dying man's heart like the welcome rain into the parched veldt; and it was David Grant's hands that closed the glazed eyes when the Angel of Death had borne away the erring soul.

SEAL-HUNTING ON THE PACIFIC COAST.

THE greater part of the sealskins sent to the London market are obtained by schooners which sail from Victoria, British Columbia, in the spring of each year, provided with many boats and hunters, and cruise during the summer and early autumn in the Behring and Arctic seas, where the seals are killed in large numbers, often in the 'rookeries' or gathering-places on some of the islands, where they crawl up on terra-firma, and are easily slaughtered. There are, however, quite a number of skins obtained, a few at a time, along the west coast of Vancouver Island and the north-west shores of British Columbia, chiefly by the Siwash Indians; and it is one of the latter expeditions we propose to describe.

The north and western portion of Vancouver Island is about as wild a country as any in the world, consisting entirely of huge rocky mountains, some of the higher peaks crested with eternal snow, and dense forests of fir, cedar, and hemlock. It is a land of great lonely lakes, of rapid rivers, and almost impenetrable forest jungles, through which even the foot of the Siwash rarely penetrates, and inhabited only by elk, black bear, wolf, and eagle. The coast is, however, wonderfully beautiful; here and there a great mountain slopes almost perpendicularly into the sea, clothed with the dark green of fir and pine right down to the water-line; while between are to be found lovely bays, stretches of golden sand; and occasionally, in some deep rock-bound fiord, the mouth of a river issuing from the unknown interior wilderness of impassable forest and rocky peak.

The Siwash or coast Indians of the Pacific are a very different race from the Indians of the plains, and are, generally speaking, cleanly and industrious. While they do not engage in any regular labour, such as road-making, logging, or mining, they are expert hunters and fishermen; and by seal-hunting, catching salmon for the large canneries, and hop-picking, frequently enjoy what is for them quite a considerable income, and are often better customers at the stores in the small villages than the white settlers. The

Siwash villages or 'rancheries' on the coast very much resemble one another, so that the description of the one we sailed from would apply fairly accurately to them all.

The reader must imagine two high mountains running for some distance into the sea, covered to their feet with huge fir-trees; between them a deep narrow valley, almost impenetrable from the thick timber, through which a river of perfect clearness runs to the sea; and on the north bank, two or three very large one-storeyed houses, built of boards roughly split out of fir-logs, in which many families of the Siwash live, each having its own particular portion of the floor, on which the bedding of skins and blankets is spread. From the roof hang long strings of smoked salmon; and in the corners are large jars and empty coal oil tins, filled with seal oil, on which, with the smoked salmon, they occasionally live for weeks together without any other food. The men are short and broad-shouldered, with by no means a dark skin; and some of the women or 'klootchmen' might compare not unfavourably with European ladies in appearance, at all events when young. They are generally good-humoured, and always seem to be pleased with the company of white people.

Looking seaward, the Pacific stretches away into the infinite distance; while along the shore at all times there is a fringe of snowy surf. Great glassy swells come rolling in, some of them nearly a mile in length, round and smooth until they reach the shoal water of the beach, when they range themselves up into great green walls, partly transparent where the bright sunlight strikes through them, and crested with a comb of pure white foam, till, rushing onward, they curl over and break on the sand or shingle with a shock like an earthquake, and pour back again down the slope a broken mass of sparkling green streaked with purest white, accompanied by the grinding and rattling of the shingle and stones that are whirled along with the backwash. All day and all night the thunder of the surf fills the air, although a gale of wind is almost unknown on this coast, where even a fresh breeze is rarely seen.

During the spring, summer, and autumn, at least the northern coast of the Pacific, with its soft warm winds and almost changeless blue sky, certainly seems to approach the ideal of an earthly paradise. Owing, however, to the great breakers rolling in, it is impossible to make a landing except in a river-mouth or under the lee of an island or reef. Early in the morning we launched our canoe, a Siwash sea-canoe, twenty-six feet long, with about four feet beam, and some twenty-six inches deep inside. These canoes are chopped solid out of a large cedar log, and show very fine workmanship. They have a beautiful shear-line, fine hollow bow flaring above water, and surmounted by a projecting beak, which, besides being ornamental, serves to lift the boat in a seaway and to take her through without shipping any water. They are always propelled by paddles, and carry two small spritsails; but being nearly flat-bottomed, are not good under canvas except with a fair wind, when they can run very fast, and will go dry through a surf that would swamp most ships' boats.

There were four of our party—a white man,

myself, and two Siwash. For stores we took a bag of flour and a tin of yeast powder, some pork, tea, sugar, and a bundle of smoked and salted salmon. A large double-bitted axe and our rifles, three 44-70 Winchester repeaters, were carefully piled on top. Each, of course, had also the inevitable couple of brown or green blankets. We soon dropped down the river, and had the usual anxious time going through the surf, which, for some unknown cause, was rather bad that morning. Right across the mouth we could see three great green ridges curling up one behind another, and the chance of getting through looked a poor one. Two of us paddled on each side, the two whites, one on either side amidships, and a Siwash at bow and stern.

The first roller was a small one, and before we knew it, we felt ourselves high on its crest, and apparently carried along backwards, stern first, with the speed of an express. All the four paddles were worked like mad, and drawing away from the summit of the breaker, we flew down its steep side until we met the second, a huge and almost perpendicular wall of glittering green water. The paddles were held in the water to take the way off her, and to keep her head on, and then the writer firmly closed his eyes, quite expecting next moment to be striking out for the surface from beneath a fathom or two. Fortunately, this was not necessary; the canoe seemed to be standing almost upright on her keel, and then all the paddles again being frantically urged, we rushed safe and dry, down the other side, to meet the third comber. Unluckily, she took a shear, and instead of the flaring bow and high beak meeting the sea-end on, the comb struck us slantwise, and poured in over the starboard bow. However, the next was a small one; and not quite washed out, we stretched away into the now smooth rollers and plied the bailing can. Luckily, a bag of flour will stand a good deal of wetting without damage; the water will apparently only penetrate about a quarter of an inch, making a dough with dry flour inside.

Setting the two spritsails and shipping the rudder, we stood away to the northward, sailing all day and all night before a gentle south-west breeze. The climate here is perfect during a great part of the year, and it is hard to say which is the most beautiful, day or night. Under either brilliant starlight or with the almost daylight radiance of the moon, on the one hand the long smooth swell of the Pacific, and on the other the dim and hazy outline of majestic mountain or silent forest, the picture was one that, once seen, is never forgotten, accompanied and driven into the memory as it was by the distant roar of the breakers on the beach. At sunrise in the morning all were on the lookout for a seal; and before noon we saw a dark object motionless on the water, apparent half a mile away. The sail being taken down, the canoe was gently paddled towards the seal, which was asleep on the surface of the water; and the writer and one Siwash, each with a rifle in hand, crouched in the bow. Slowly we were paddled up until, when about one hundred and fifty yards away, the seal moved, and appeared to roll over. At once both of us fired, and our prey disappeared only to again come to the surface, splashing and rolling

about. The Siwash kept on working the 'Magazine,' much to our disgust. We could only hope that he was a bad marksman, and would therefore not plug the skin more than necessary. However, in a minute or two we were alongside, and had the prize safely on board. Then a somewhat unusual fresh breeze sprang up, and after an hour or two turned the smooth rollers into rather nasty crested seas for a deeply loaded canoe; and we were at length glad to step the foremast and run for the shelter of an island, on the lee side of which the canoe was beached in fairly smooth water and launched up.

As so far we had fed on dried salmon alone, we were glad to have a chance of making some bread. A hole two or three feet deep was scraped in the soil, and a big fire of fir-wood chopped out of the all-prevailing forest made over and in it. After the hole had filled up with red embers, and had become hot enough, it was carefully raked out; the flour, at once mixed with yeast powder and water into a dough without kneading, was wrapped up and put in; and in a short time the large loaf was ready, a good many pounds in weight. Primitive as the outfit is, the writer has never seen more wholesome bread turned out by city baker than that made in this manner by many a lonely lake and mountain in the far North-west.

Next day we again launched the canoe, and with a gentle fair wind, stood again to the north. Day after day and night after night passed, always the same soft wind, the ever blue sky, the bright sun overhead by day, and the silver moon at night. All day the shore on our starboard hand rose high and rocky; the lower sides of the hills, covered with dark-green firs, with a dividing line of white surf where the dark foliage met the deep blue of the sea, the only difference between day and night being the softened outlines and grayer colours during the latter. This was very pleasant; but as seven or eight days passed before we killed our second seal, asleep on the surface like the first, it was by no means profitable business; and as the provisions were getting low, we had reluctantly to turn the canoe's head southward with only two skins aboard. A sealskin on the animal is very different from the same made up into a jacket or mantle. In its natural state it is covered with a long and rather coarse hair, which is either cut off or pulled out by the furriers before the soft and glossy appearance of the made-up article can be obtained.

As the wind had drawn round to the south-east, and as the canoes will not turn to windward under sail, we had to take down our masts and settle down to steady hard labour, paddling all day dead to windward, and all night too, unless we could get ashore under the lee of an island. Under these circumstances, the time passed tediously enough, and no one was in the best of tempers, until, when nearly home, and pretty well worn out, one day, when driving the canoe through a little frothy head sea, a seal suddenly came up within fifty yards of her. All of us had been used to quick shooting at deer rushing through the thick bush; and the paddles were tossed into the boat and rifles grasped instead in the course of a second or two, and before the seal had time to see us, two bullets—one in his

head and the other through the body—stretched him out, an ungainly object, close alongside. The wind freshening still, and there being no place where a landing could be made, we had to steadily slave away with the paddle; and after nearly thirty hours of almost uninterrupted labour, we reached the mouth of the river we had left. The wind being partly off the land, and the surf running, of course, with us, we came through quite dry, and were delighted to stretch our aching backs and arms, and to camp at night in the then, to us, luxurious though flea haunted rancherie, instead of on the damp flooring of a rolling canoe.

As the skins are only worth from twelve to fourteen dollars each, it will easily be seen that the trip was not a great financial success; but for any lover of nature, a similar voyage along this beautiful and almost untrodden coast, with the great snow-capped mountain rising over the coast ranges, its lonely, dense forests, and wonderful deep fiords, seen under the almost unchanging blue sky, would form an experience not to be forgotten in a lifetime.

IN HOSPITAL.

In the long night-time, when the ward was chill
And drear with sleeping faces thin and white,
One lay in wakeful silence, wan and still,
And waited for the light.

And as he lay and waited for the morn,
And peered about the dim, familiar room,
The door into that glimmering place forlorn
Opened, and some one entered through the gloom—

A shadowy Shape that filled him with a vast
Vague fear; it came in silence and alone;
Mutely it glanced from bed to bed, and passed,
But paused beside his own—

Paused, and looked down, and all his terrors fled;
He grew as quiet and as restful now
As if his mother stooped beside the bed
And laid her cool hand on his fevered brow.

And looking up into its eyes but seemed
Like looking into hers that loved him so;
He heard old voices speak, as if he dreamed,
Of things of long ago.

And 'What art thou?' he asked the Shadow then,
'Who comest so like memory old and dear,
That I, who feared thy coming, loved thee when
I saw thine eyes and felt thy presence near?'

Then, in the hush, an answering whisper saith—
(His child it was that answered, or his wife,
Loved and long lost)—'This is that Angel, Death,
Whose name in heaven is Life.'

And when the night was gone, and morning shed
A sunny glory into all the place,
They came and put the screen about his bed,
And wondered at the smile upon his face.

A DAY IN ELSINORE.

By CHARLES EDWARDS.

THE chance of travelling in Denmark in a train called 'express' was of itself alone almost enough to tempt me to take the run from Copenhagen to Elsinore. Nothing more terrible as a trial of patience can be imagined for an impetuous man than a long course of railway journeys in Scandinavia. It is much the same in Sweden and Denmark in this respect. If you fail to get into an express train—and there are very few of these—you may spend a whole day in covering less than a hundred dreary miles.

Besides, in my case it was winter. It is all very well in the bright northern summer to have from ten to twenty minutes to loiter at each little railway station. In winter, however, when you may have thirty or forty degrees of frost in the outer air, the constant going and coming of travellers keeps you in a perpetual state of discomfort, and you have no inducement to stretch your legs in these little wayside stations, which have nothing for you except a dull series of advertisements and a succession of keen draughts.

The distance to Elsinore is rather under forty miles. To cover this in a little over an hour is a feat of which the Danish State officials are reasonably proud. In Denmark the bulk of the railways are in the hands of the Government. This has its advantages as well as its disadvantages. A Government is bound, for example, to care for its subjects. Therefore, perhaps, it is that slow but sure travelling is one of the features of Danish railway locomotion, even as also the carriages are in winter kept excellently warmed. On the other hand, the fruits of enterprising competition between rival railway companies are not obtained. As a further comment upon the State influence here, it may be mentioned that the more important trains carry electric light, in the blessing of which even the lowest class of travellers participate.

Elsinore is famous for two or three characteristics. I suppose most of us on this side of the

German Ocean are still fanciful enough to think of it chiefly in connection with Hamlet and his father's ghost. Until about a generation ago, to merchant shippers it was a subject of execration because of the Sound dues, which were here collected. Both these elements of interest may, however, be dismissed from the mind nowadays. To the ordinary person, whether a business man or a seeker after the picturesque, the town appeals most as the ferry port betwixt Denmark and Sweden. There is here only some two and a quarter miles of waterway in the Sound. A man must try very hard if he is to be sea-sick in so brief a crossing, especially with so much beauty and animation around him: the gay villas of Helsingborg on the Swedish side, with their wooded knolls; Kronborg's noble castle by Elsinore; the long line of Danish pleasure resorts north and south; and the myriad of craft of all kinds—from one tonners to five thousand tonners—which adorn the blue waters far as the eye can see up and down the Sound.

As it was winter, however, with the thermometers of Copenhagen sticking at zero, I scarcely expected a surfeit of the beautiful either *en route* or at Elsinore itself. An unkind gray fog hung over the capital when we left it; the same mantle stayed low upon the spew-bound landscape on either hand of us. From out of it, once or twice, several blotches of black stood strongly, telling of the forests around the summer palaces of Denmark's king. But there was too much rime on the window of the car to allow more than a dim glance at these. I had as companion a stout, good-natured man, who entertained me with English conversation. He had been cut to pieces by a railway train years back during a holiday in which he had come from America to his homeland; and, thanks to his amazing constitution and the doctors, his trunk had survived the shock. I did not at first notice how he was mutilated, he looked so hale in the face. He was extremely anxious to be agreeable, poor fellow, and succeeded entirely. 'Now, what,' he asked, after telling about his accident, 'would

you have done if you had been me? Would you have stayed in Denmark or gone back to America?' It was an odd question, since I knew nothing of his circumstances. But on general grounds it seemed to me that for the battle of life in the States at least a pair of hands and legs are necessary; and so I commended him for his own determination. The commendation pleased him.

Near Elsinore, the train hugs the sea-shore; but on this day you would never have dreamed you were by ocean's flowing tide. In fact, there was no water to be seen. All was frozen fast, and buried beneath six or seven inches of new-fallen snow. The fog east cut the horizon short even as it severed it in the west. There was but a white level skirting for the mind to toy with. Here and there men were to be seen fishing. They had dug themselves holes in the ice, and tried for their prey with nets and long-handled tridents. Snow-bound villas with fantastic eaves and gables rose at intervals in the haze, compelled admiration, and were lost to sight. And so at length we sped into Elsinore station, which my companion described, and I think justly, as 'the most beautiful in the world.'

Here the ferry-boat was at hand, ready to plough its way through the ice-floes to Sweden. A bevy of travellers in furs boarded it; and a bevy of disestablished watermen, fisher-folk, and others stood by with blue noses to watch its interesting exodus. For my part, I was not for Sweden to-day. When I had watched the boat begin its crunching against the blue bergs, I put my hands deep in my pocket and went away to see what I could of Elsinore.

The town is a neat little place of about nine thousand inhabitants, and shows very scant traces of the antiquity it may claim to have. Its streets are cobbled and flagged, and its houses mainly of wood, with a certain irregularity of style, though similarity of windowed gables, which has a pleasing effect. The Elsinore children were sliding their way to school with reckless swing of their book-bags and with very rosy cheeks. Save for the children, Elsinore's streets slept tranquilly under the snow which covered them. I soon came to an amiable signpost which told me just what I wished to know. It bore two black, weathered arms. Upon the one was the word 'Kronborg;' and upon the other was written 'Marienlyst.' Thanks to the fog, the Kronborg arm seemed a mere delusion. For whither it pointed could be seen nothing but a fuming and stinking factory of gas and storeyard of coal. Instead of the gracious pinnacles and embellished gables of the mediæval castle, there were chimney shafts, grimed walls, and doors inscribed, 'No admittance except on business.' From one of these last, a trio of black-faced operatives emerged into the purer outer fog as I passed the place.

For the present, however, I left Kronborg to itself. I was for Marienlyst, that sweet strand of villas bowered amid trees, of green meadows bordering the yellow sands laved by the blue sea, with its bosky ridge binding it close on the west, as if to keep the pure air of the ocean diffused through it. The snow was quite tiresome. It must have been a foot deep when I had left the last house of the suburbs behind me. They had gazed at me somewhat inquisitively

from these snug little white houses, as I plodded past their double windows.

Marienlyst was in white mourning. Its houses on the edge of the sand and its radiant crimson and yellow villas were thick in snow and desolate as the Pyramids at midnight. No cheerful threads of azure smoke were visible above the chimney-pots. The very entrances were flanked high with drifts of snow, and icicles of appalling magnitude hung from the gutters of the roofs like portcullises. A belated bird squeaked rather than twittered as it flew over my head; and the thin wail of the telegraph wire was heard through the fog. I saw no one in front; and now that I had gone from Elsinore, I could see no one behind. The white statues in the gardens of the Bath Hotel—empty as a soap-bubble—looked altogether miserable. Can you imagine anything more distressing to a sympathetic person than the discovery of groups of Graces, Venuses, and the like, unclothed, in the open, with snow to their knees and thirty degrees of frost pinching their woe-begone faces?

But I had not come to Marienlyst to see empty houses or the martyrdom of marble ancients. Like the rest of my countrymen, I yearned to see where Hamlet, that wondrous madman, lies interred. For the moment I was content to laugh anachronisms to scorn. Faith should overcome them, as it has overcome so many tougher obstacles. Much, indeed, should I have to reproach myself with, if, being at Elsinore, I failed—no matter what the season—to commune with this brilliant young Dane's disembodied spirit in echoing its own corporeal utterance so many centuries ago, 'To be or not to be,' &c.

I had no very exact idea where to look for the sepulchre. Chance came to my aid. I plunged into one drift worse than the rest, and in scrambling from it saw a mound beyond, overshadowed by trees. A monolith, small and smoothly chiselled, topped the mound. It was as I guessed. This pretty little pile of rockery, a few feet high, covered Hamlet's dust—the trivial remains of the inspirer of an inspired man. Upon the monolith may be read the convincing words, 'Hamlets Grav.' I hope my readers will not misunderstand me, that they will, in short, see that 'My tongue and soul in this be hypocrites.' I could not possibly, though I had strained my hypocrisy to the bursting-point, have shed the tear of sensibility here, so persuaded was I of the unauthenticity of the tombstone. Nevertheless, I was not wholly unmoved. The fancy has its own empire.

Subsequently, I bought a photograph of the grave in a shop in Elsinore. I asked the young woman who sold it to me if she had any doubt of the truth of the thing. 'Was it really Hamlet's grave?' She seemed shocked that I could even hint at scepticism on such a subject, and would have put the photograph aside for a more worthy purchaser, had I not interfered. As if to overwhelm me with evidence, and the more to pique my unbelieving nature, she would fain also have found for me a picture of the brook in which poor Ophelia drowned herself. It was somewhere in the shop, she was sure. I urged her to seek for it; but she sought in vain. 'It is a very little river, sir,' she said, as if to excuse herself for being unable to discover its photograph. I am sorry, truly sorry, I cannot put

poor Ophelia's brook in my album of curiosities side by side with Hamlet's tombstone.

Satisfied with my experiences in Marienlyst, I returned to Elsinore. At the byroad I deviated to Kronborg. The fog still held; but there were scarlet-coated soldiers on the track, and following them as torches, I soon came to the broad moat and drawbridge of the castle. A couple of warriors were in the ditch sweeping a convenient area on its ice for the exercise of the officers and their ladies. Above them loomed the nearer of Kronborg's pinnacles. The castle is a showplace in summer. There is a tariff for admission, which includes an ascent to the telegraph tower, the highest point of the old fortress. The girl who took me in hand, however, positively declined this latter adventure. If I would wait for her father—the orthodox cicerone—it might be compensated. Even then, it seemed a freak of folly in mid-January. But when the man came he showed more regard for a traveller's enthusiasm. Without ado we crossed the courtyard of the castle, its snow studded gaily with knots of gossiping soldiers, and straightway attacked the steps. But of course there was very little to repay us for our toil. The snow on the turret roof was a fathom deep and soft as pepper. The wind howled over the exposed summit. And there was nothing to be seen from it except the castle courtyard much foreshortened, and the piled sand on the seaward side of the castle, with the pallid mist wrapping sand and the frozen Sound with chill impartiality.

The chapel of Kronborg was much more cheerful to behold. Its woodwork pulpit, pews, organ, and royal 'box'—if I may call this so—of minute carving and brilliant colouring, with a predominance of scarlet, gladden the eyes. It is small but dainty. My guide bestowed a string of eulogistic adjectives upon it, and really quite half of them were not much out of place.

There are also pictures in Kronborg—a double suite of low rooms full of them. The pictures are poor things, even the historical ones scarcely sufficiently well done to allow the mind to appreciate them for the drama in them, quite apart from their demerits of workmanship.

Two features only stay in the mind as strong reminiscences of Kronborg. The one is the small octagonal chamber always associated with Caroline Matilda, Christian VII.'s divorced queen, and our George III.'s sister. If she had a soul much alive to the attraction of marine prospects, this room must have given her pleasure at times. Its outlook over the Sound and Sweden is admirable in fair weather. But on this day it sounded grim to hear that the poor lady occupied such an apartment. As well might a man be congratulated on inhabiting a cage suspended from London Bridge during a week of persistent fog. A little after we had viewed this chamber, the guide brought me level with a kind of terrace, on the eastern side of the castle, with banks of dingy sand pressing it, the sand set with trivial guns, pointed seaward. Here the gentleman struck an attitude, and with a flourish of hand that would not have discredited a real life 'cicerone' of Italy, remarked: 'This is where the spirit appeared—Hamlet's father's spectre, the royal ghost! This is the terrace it haunted, and here were the soldiers when it appeared to them.'

The announcement did not come unexpected. Still, I could not welcome it seriously. There was less here to send it home to the mind than I had found by Hamlet's grave. I suppose, however, one must treat most legends with a certain mercy. I did not therefore attempt to cross-examine my guide, but received his statements reverentially, as I gazed at the snow-clad terrace and the forbidding sand with its artillery.

Such are the attractions of Kronborg, which has now fallen from its high estate as a guardian of the Baltic, to become a mere barrack!

The short January day had already begun to wane when I had done with the castle. I returned, therefore, to the railway station, dined in view of the score or two of fast-frozen steamboats and barques in the port, smoked my cigar, and prepared for the evening express back to Copenhagen. My friend of the morning did no more than justice to Elsinore's railway station in talking of its beauty. It is a gem of a railway station—in style more nearly Elizabethan than aught else, though in Denmark they would call it Christian the Fourthian, since that monarch in the sixteenth century introduced it so largely throughout his realm. Externally, it is of red brick and white stone, having a staircase gable in the middle of its façade, flanked by a square tower, capped by a pinnacle on either side. Within, it is altogether pleasing, with its red brick walls, pale-blue iron girders, whence depend electric lamps shaped like ostrich eggs. Its very advertisements are artistically arranged, and none are aggressively prominent. The officials are in keeping with their chaste surroundings: comely men with the courtesy of aristocrats.

I ought to grieve to confess it, but really Elsinore's railway station stays in my mind as the most engaging thing in the district. It is a model. One cannot help being utilitarian. Hence I feel no shame in avowing that all Elsinore's traditions about the royal Hamlet are of weak interest compared to this excellent achievement. The architect's name deserves to go down to posterity.

POMONA.*

CHAPTER XII.

You love: no higher shall you go,
For this is true as Cæsar's text;
Not noble *then* is never so,
Either in this world or the next.

TENNYSON.

WHAT a curiously constituted thing the human heart is! It is no wonder so many novels and love-stories are written, for the variety of effect produced on the puppets when love pulls the strings is infinite, and there is no calculating beforehand what will happen; it can never be reduced to an exact science or argued about; the same causes produce directly contrary effects, and the unexpected is generally what happens, though not invariably so; so we may not even reckon on that.

There is, however, one thing that I think is generally the case, and that is, that anything like opposition strengthens the feeling of love—indeed,

* Copyright reserved in the United States of America.

may sometimes be said to create it. Perhaps this was the case with Maurice Moore. I cannot help feeling that if he had not hastened his departure from Scar in consequence of Owen Ludlow's representations—if Owen Ludlow had held his tongue even at the risk of that last remaining day, allowing opportunities for yet more tender tête-à-têtes, or farewell words, Maurice Moore would have gone away and forgotten all about Sage. I even go further, and think that if he had not had to get up so very early to catch the up-train—if the morning had not been wet and the walk into Shingle muddy and uncomfortable—if his portmanteau even had arrived, as it should, the same evening, instead of visiting about at various stations on the way up, and only reaching its destination at the end of three days, thereby causing much discomfort and irritation to its possessor, if none of these *contre-temps* had happened, he might not have remembered her so constantly. But he felt that he was enduring a good deal for her sake, beginning with his old friend Ludlow rounding on him, and not, he maintained, doing him justice; and this sense of injury rankled, and naturally kept him in mind of the cause of it.

And then, when he got back to Edelstadt, he found the society there uncongenial. The reigning beauty at the Embassy at the time was a girl who had 'a tongue with a tang' to it; and Maurice got into her bad books, and she used her sharp weapon unmercifully on him. She was a good deal cleverer than he was, and she made him look ridiculous before other men, and that is a thing hard to forgive. And there was a new *attaché*, whom the beauty greatly affected, and who was well off, and had expectations in the future, and a possible title; and on every occasion, this 'conceited puppy'—as Maurice, perhaps unjustly, entitled him—was preferred to Maurice, and brought very much to the fore.

At another time, Maurice might have been amused at this petty warfare, and have taken up the cudgels, and paid his enemy back in her own coin; but he had no one to back him up, and laugh over the joke of it with; for one of his special friends out there had gone to India, and another was in very low-water, and too much taken up with his own troubles to enter into other people's jokes. And it is almost impossible to go on feeling amusement at a joke, especially one with a sting in it, unless you have some one to participate in the fun.

And then, too, he was not very well; and it is humiliating to realise how much this may have to do with emotions of the heart. I am afraid sometimes that a blue pill may have a very beneficial effect on a broken heart, and a tonic prevent the worm in the bud from preying on the damask cheek. Anyhow, circumstances within and without him combined to give Maurice a disgust of his present life, of the empty round of inane society, and of the conventional girls he met there, whom he had found tolerable enough before they had begun to worship the rising sun,

and of the empty-headed men who had not two ideas to rub one against another.

So, naturally, his mind reverted to the little, fair girl at Scar, who never said a sharp, cutting word, though it was not for want of brains; for she had twice as much in her as that sneering Miss St Clair, 'who thinks herself so mighty clever.' Sage was not one of those conventional dressed-up dolls of whom you could calculate to a nicety beforehand what she would say on any subject. Sage's conversation was full of simple little surprises, always pleasant ones too; her opinions were not second-hand; they might be often girlish and illogical, but they had a quaint originality about them, and at any rate were real, and not merely for effect.

Owen Ludlow thought so much of her, too. Maurice felt that since that last evening at Scar, his old friend was not quite the same to him; he fancied his letters were cooler in tone and less frequent; and there was never a word about the Merridews, though Maurice felt sure the friendship had not collapsed when Sage left Scar. He amused himself one evening, when he was more than usually out of tune with his surroundings, by imagining what Owen Ludlow would say, if, for love of Sage, he, Maurice, gave up his prospects, which, all said and done, were not so very brilliant, and settled down in some humbler sphere of life, into some government office or bank, or something of that sort, and had a little house in some pretty, unfashionable suburb, where Sage should be surrounded with everything pretty and tasteful, and be perfectly happy. Of that last part of the story he had no doubt at all, conceited fellow!

And after that first indulgence in such a day-dream, he often reverted to it, and filled in details and imagined incidents, till, by Christmas, it had assumed such solid proportions, that when the chance of a few days' leave turned up unexpectedly, it seemed the most natural thing in the world to go right off and find Sage, and lay the matter before her, and to tell Owen Ludlow his plans, and ask his assistance in carrying them out.

His own people up in Yorkshire would no doubt make a bother; but that could not be helped; he was man enough to settle his own affairs, and to know what was best for him; and by this time he was entirely convinced that Sage was the best for him; and he was quite sure that Owen Ludlow would say the same.

His programme was to go straight down to Scar and talk the matter over with Ludlow, and find out from him where Sage lived. But he was saved this long fruitless journey into Dorsetshire by asking at Ludlow's club, where he was told that the painter was in London; and he made his way instead to Regent's Park; and Ludlow found him established there when he reached home after his visit to the Merridews on Christmas Eve.

It cannot be said that at first Ludlow's greeting to his young friend was particularly hearty; but after that prolonged sitting, which lasted far into Christmas morning, Ludlow had been talked into perfect sympathy with Maurice, into romantic enthusiasm which exceeded even Maurice's, into belief in love in a cottage and simple happiness worthy of a girl in her teens, into utter

oblivion of worldly wisdom and hard common-sense, into building castles in the air of an elaborate style of architecture rarely attempted except in extreme youth. He went to bed at last in quite a whirl of pleasant anticipations; it was so delightful to think of the happiness this would bring to his little friend. He had accused himself so often of having been inadvertently the cause of spoiling her life, that it was an infinite satisfaction to have some hand in glorifying it.

The sense of having regained Owen Ludlow's good opinion had a very fortifying effect on Maurice's resolutions, and everything combined to make him well content with the turn affairs were taking. There was something quite providential, Sage felt, in the unusually favourable aspect under which the little house at Dalston first presented itself to Maurice Moore, if it were not profane to attribute such small matters to Providence. First of all, there had been a fall of snow the very morning after Christmas-day, and all the street and houses were clothed in white, which had not yet had time to become smutty. Then Sarah opened the door in a tidy black dress, not gaping at the seams, and disclosing mysterious under garments; and, moreover, she had on a spotless cap and apron, an event almost unparalleled in the domestic history of the family. And Sage, as she gazed shyly at herself in the little looking-glass, was not displeased at what she saw, and was glad her serge dress fitted so well and was nicely made; though at the time of its construction she had had a dreary, little feeling in her heart that it did not matter and nobody cared. But even if she had never seen Maurice again, I do not think she would ever have really felt that it did not matter how she looked; there was always the feeling that the girl he had liked, even a little, ought to look her best.

And it all went so pleasantly, and father was so nice—there never was so nice and kind a father. He took Maurice off into the surgery, where they had a long talk; and when they came in, he was seized with a sudden and, as it seemed to the boys, unseasonable desire to hang the picture of Kitty in his bedroom, an operation which of course required the assistance of the boys and Kitty, and apparently took a wonderfully long time. Kitty described to Sage afterwards how father kept changing his mind as to where the picture should hang and would look best. 'And would you believe it, Sage—Nigel drove in six nails; and after all, father decided on the very first place we put it in, opposite the window. And I told him ever so many times that he ought to come down and talk to Mr Moore, and that I knew you would be awfully angry at being left all alone with him such a long time.'

Was it a long time? Sage wondered. And then they had tea; and then Maurice carried them all off except the doctor, for Owen Ludlow had by some happy accident got a box at Drury Lane for the pantomime, which seemed to the children almost incredible bliss.

It was such exquisite pleasure to have her cloak wrapped round her, and to be taken care of, and no rude crushing allowed to come near her, she who had pushed her way hitherto, and taken rubs and elbowings as a matter of course; and to feel

his hand seek hers, and to hear his voice sink to a tender tone that made the most commonplace remarks sound like poetry; and for Owen Ludlow to take it for granted that Maurice should monopolise her and take care of her; and that she should linger on their return just for a minute to say good-night at the door, while the children rushed in to describe to father all the glories of the pantomime, Dennis and Nigel being anxious to illustrate some of the practical jokes played by the clown on the pantaloons, but neither of them being willing to enact the pantaloons' part.

Sage was obliged to tell Kitty something about her happiness, when she went up to bed, finding Kitty wide awake with the excitement of the theatre. It seemed as if she must impart some of her great joy to some one of the womankind, though it was only a child who could not understand a tenth part of all it meant to her. But to kneel by Kitty's bed with the child's warm arms round her neck, and sob for very happiness, seemed to relieve the heart that was full to bursting with happy love. It seemed next best to laying her head in mother's lap, that dead mother, whom she sometimes conjured up to love and sympathise with her in trouble or joy.

Next day was quite as perfect; for Owen Ludlow had arranged a grand shopping expedition to get Christmas presents; and 'poor Sage,' as Kitty described it, 'was left behind in the studio, and did not go to any of the lovely shops and bazaars; and Mr Ludlow did not buy any present for her. Mr Moore stayed with her; so perhaps she did not mind; Kitty added doubtfully, with a remembrance of Sage's confidences the night before, which were somehow mixed up with harlequin and columbine's adventures.

Mind? It was only too delightful to sit over the studio fire and hear all that was to be in that bright future, painted by Maurice in such glowing colours.

It was his last day; and he would have to return to Edelstadt to-morrow; but the parting would not be for long, he told her. Ludlow was going to make all sorts of inquiries after the employment that was to provide ways and means for that jolly, little house.

'Good old Ludlow is as keen after it as I am, pretty near, and he won't leave a stone unturned. He knows heaps of fellows, you know, and has a lot of interest of an odd, out-of-the-way sort. We must have a room for Ludlow—mustn't we, Sage?—whenever he likes to come up to London. I wish I hadn't to go back at all. I wish I could stop here with my little sweetheart; but I may get a chance of running over again before long; but it won't do to be extravagant, eh, Sage? I shall turn over every sixpence now. Ludlow has been reading me a fine lecture on economy; and he's quite right; and I mean to be as close-fisted as anything.—And look how I have begun! I haven't even got a ring for my little lady-love. Just think of that! Every ploughboy gives his sweetheart a ring nowadays; and I have none for mine. But when I come home I shall bring one. Even if I don't come before, I must come for the private view. I must be among the first to see my little girl's picture in the Academy. Isn't it queer that we should be in one picture before we ever met, just you and me, Sage, with little Kitty to play propriety.'

'And Pomona, Maurice.' Her voice would not keep quite steady yet to say his name.

'Oh, Pomona does not count; she is merely imaginary. Of course, I know it is Ludlow's remembrance of his wife; but I often wonder if it is really a bit like her, whether he has not idealised her out of all reality? And I also wonder, sometimes, looking at it—I have been looking at it a good deal to-day, Sage, not so much, I must confess, at the central figure, but at that right-hand corner where there is something far more interesting—but I wonder sometimes, looking at Pomona, whether in real life one could call her pretty at all, though she looks pretty enough in the picture.—But don't tell Ludlow what I say, for he would regard it as rank heresy.'

'You will not go away without saying good-bye this time, Maurice?'

And then she had to tell him all she felt and suffered that day at Scar; and he pitied and comforted her, and blamed himself, and, in self-excuse, told her all he had gone through, and the dreary start from Scar in the wet and misty morning, and how he had looked up at the window with a drawn blind opposite the 'Black Dog.'

And next day came the parting, and father—that good father, who really felt a little hurt and injured at the entire desertion of him by his former devoted admirer and slave, yet managed to give her twenty minutes alone with Maurice to get through the sweetly painful operation of saying good-bye.

'All my patients will be poisoned in consequence,' he complained; 'for I let Nigel and Dennis make up pills; and when my back was turned, preventing Will and Kitty from demolishing all my lozenges, they put in all sorts of drugs they had no business to. Well, it will be on your head if any mischief comes of it.—Bless you, little Sage!' And he took the little fair head on which the blame was to fall, between his hands and kissed it.

GALL-FLIES AND THEIR WORK.

THE drop of ink which flows from my pen as I write these words is intimately connected with the insects about which I am going to make a few remarks. For to certain of their kind we owe the gall-nuts which form so important an ingredient in its manufacture. Gall-producing insects belong to two different orders. The first, along with bees, wasps, and ants, come under the Hymenoptera; the others, along with the flies, are known as Diptera.

It is their remarkable power of modifying plants to suit their own ends which renders them of special interest. One of them alights on a tree, inserts its ovipositor, and lays its egg in the puncture. Thereupon, the vital energy of the plant is directed to that spot, and throws up around the egg a mass of nutritive tissue. This tissue serves at once as the cradle and food-supply of the grub which is presently hatched, and which remains there until it emerges a perfect insect.

Man, in order to coax the vegetable kingdom to supply his needs, has had to select and cultivate laboriously for many generations: the gall-fly with a touch, so to speak, of its ovipositor calls

forth the required result at once. Had it appeared at the wave of the magician's wand, it would scarcely have appeared more wonderful.

One of the most remarkable facts in the history of the gall-fly is, that different species acting on the same tree produce totally different results. Thus, one of them puncturing the wild rose gives rise to one of those pretty moss-like tufts which so frequently adorn it. Another on the same plant produces round growths resembling currants in size and form. A much greater variety of form is produced on the oak-tree. No fewer than fifty species of gall-fly, indeed, are said to produce their particular forms of growth upon it. One of the most common is that which produces the marble gall. This gall is produced on the twigs in the form of round bodies, soft and green at first, afterwards brown and woody. The familiar oak-apple is of more irregular shape, and prettily coloured red and yellow like a fruit. Of a similar shape to the marble gall, but softer, and of a pretty red colour where exposed to the sun, is the cherry gall. Another fruit-like gall, small, round, and often appearing in clusters on the male catkins of the oak, is known as the currant gall. Still more remarkable, perhaps, is the artichoke gall. In this case the gall-fly has laid its egg in the centre of a bud, and the vegetative growth, though disturbed, has asserted itself in a symmetrical manner. The oval body in the centre, containing the egg or grub, is covered with a series of imbricating or overlapping scales, so that the whole bears a striking resemblance to the involucre of a thistle.

Of quite another class are a number of small galls which appear studding the leaves in considerable numbers, and are known as 'spangles.' They occur in the form of little disc-like bodies, each attached to the under side of the leaf by a tiny stalk. These spangles are of different shapes according to the different species of fly forming them.

The cause of this variety in the vegetative response to what seem to us such similar stimuli, is somewhat of a mystery. When it has been said that differences in the shape of the original wound, in that of the egg and grub, in the nature of the irritant fluid injected with the egg, in the position of the wound on the tree, probably all contribute, there is perhaps nothing more to add. Or we may shelter our ignorance by speaking of the influence of the vital force of the egg. And what makes the thing more remarkable still is the fact that other insects can puncture the leaves of plants and lay their eggs without causing any abnormal vegetable growth. This is the case, for example, with the whole class of leaf-miners.

The oak responds with overflowing generosity to the appeal made to it by the gall-fly, and provides nourishment far in excess of the wants of its guest; and so it happens that the cradle and larder of one particular gall-fly are made use of by others. We have here one example among many of the curious mixture of reckless extravagance and strict economy to be found in nature. Flitting about among the branches of the oak-tree are countless myriads of flies on maternal thoughts intent, which have nevertheless no power of inducing the oak to provide galls for them. But here are the marble galls produced by another species forming a ready-made supply

of nourishment of the right sort. Piercing the excrescences with their ovipositors, they deposit therein their eggs and depart. The young are hatched, and feed on the substance of the gall without damage to the rightful owner—there is food sufficient and to spare for all. The rightful owner is indeed fortunate if nothing further happens to him than this feeding on his preserves without doing him bodily injury or starving him. For there are other and more dangerous flies flitting about the oak-tree. Glittering in green and gold array, and armed with long ovipositors, they also are looking out for places to deposit their eggs; and the only place that will do is the *body* of the fat grub lying in the centre of the marble gall. Hence it is woe to the original possessor when one of these gay hoverers chooses its gall. With its long ovipositor, the fly pierces the gall, and places its egg *within* the body of the grub inside. An exceedingly common tragedy in nature is played out within the narrow stage of the oak-gall. The second comers to the gall—the harmless ones—are likewise subject to their own proper parasites, and may be made the unwilling receptacles of their eggs. And then the nutritious mass of the gall proves acceptable to caterpillars of various small moths, while beetles, bees, and wasps may avail themselves of it as a shelter. Thus many species of insects may be found in an old oak gall. An enthusiastic naturalist once counted the different species in one of them, and they amounted to forty-three! These included six species of small moths, seven beetles, and the rest saw-flies, gall-flies, ichneumon flies, mason wasps, bees, &c.

The marble gall is properly inhabited, as we have seen, by a single grub; but the fly which causes the growth of the oak-apple lays several eggs. These are contained in a group of hard woody cells near the centre of the gall, the rest of which is soft. The soft part is frequently eaten by insects, or torn away by birds in search of the grubs; and the hard cells remain on the tree, where, along with the hard brown marble galls, they may be seen during the winter months.

The life-history of the insects inhabiting the spangles on the oak-tree leaves is of peculiar interest. It furnishes us with an example of what is known to naturalists as alternation of generations, and of parthenogenesis. Two distinct forms of gall-fly were formerly described as different species—they were even placed in different genera. One of them is found inhabiting the currant galls, and the other in one form of the spangles. Some fifteen years ago it was shown by Dr Adler that they were two different stages of the same species of gall-fly; and the discovery has since been confirmed by others. These two forms, so distinct as to be ascribed by naturalists to different genera, proceed the one from the other by direct generation: the children are totally different from their parents, but the grandchildren resemble them. This is termed alternation of generations. In May a little gall-fly lays its eggs on the leaves or male catkins of the oak, and the currant gall is produced. Development is rapid; and from this gall issue male and female flies. After mating, the females pierce the oak-leaves and lay their eggs. But

instead of a second crop of currant galls, there appear spangles. This takes place in the autumn. After a while the spangles become detached from the leaves and fall to the ground; there they swell, and the further development of the larva takes place. In the spring, there issues a fly perfectly distinct from the one which laid the eggs on the leaf and produced the spangles; and, strange to say, they are all females: no males appear among them. Yet these females puncture the oak-tree, and lay their eggs to produce another crop of currant galls, as their grandparents did, but not their parents, which produced spangles. From these currant galls issue male and female flies as before.

Other trees and plants are liable to the attacks of gall-flies. In late summer and autumn, the willow bushes are often seen covered with pretty red fruit-like bodies adhering to the backs of the leaves. These are also galls. Less symmetrical and beautiful are the effects of gall-flies on more lowly plants like wild thyme and speedwell, on which they take the form of irregular swellings and distortions of the stems and leaves. Probably, indeed, the possession of a peculiar gall fly or flies is the rule rather than the exception among plants.

The influence of man on vegetation has been deep and far-reaching: nature has responsively ministered liberally to his needs and his sense of beauty. Yet the wild rose, yielding to his prolonged efforts the 'Gloire de Dijon' and the 'Baroness Rothschild,' is less of a wonder than the same bush bursting out into mossy tufts and round berries under the influence of insects; the Chinese oak, a hundred years old, growing in a small pot, has less of the marvillous than that one in the hedgerow responding to the punctures of thousands of its tiny guests, and covering itself with oak-apples, marble galls, spangles, &c., to supply them with food.

THE BURDEN OF ISABEL.*

CHAPTER XLII.—DISSOLVING VIEWS.

THUS Isabel stepped from her proud position as the courted heiress, and divested herself of her 'gold and jewels,' her 'silver and pearls.' When her aunt took her departure for Lancashire—Mr Suffield having still to remain in town for a day or two—Isabel met her at the station with a small box, which she enjoined her aunt to take great care of and not to open till she was in her own North. That box contained the jewellery of rare foreign workmanship which Uncle Harry had left: so resolved was she to be rid of all she could be rid of that had belonged to Uncle Harry. She tried to be rid also of the furniture and other things that had been bought with Uncle Harry's money; but Ainsworth had thought it was a pity that her pretty home should be broken up, and he had suggested a compromise. He had gone to Mr Suffield and proposed himself to pay for the things. But Suffield had been so angry at the suggestion, and had so obstinately declared that if he heard any

more of it he would have nothing to do with the money at all, that the matter was allowed to drop. Then Isabel sweetly asked Ainsworth why the flat should be given up: would it not do as a dwelling for both of them?

'And then,' said she, 'then I shall feel as if I had brought you something—a very little something!—besides myself and the cares I took upon myself.'

And then Ainsworth, greatly daring, asked, since the dwelling was ready and since she was now—or soon would be—a mere spinster without an income, why they should not prepare to join hands and purses as soon as possible?

So it came to pass that an early day in spring was fixed for their wedding. Isabel went to see her father with the uncertain design of asking him to perform the usual office of a father on such an occasion, and 'give her away;' but his sequestered life on the Surrey hills seemed so serene, he was so occupied with his 'Defence of Transcendentalism,' and he showed so remote an interest in what she told him of herself, that she thought it was a pity to disturb his equable leisure.

'I am delighted to hear it, my child,' said he. 'Marriage, with love, is the completing of a woman; so she fulfils the law of her being. You should read Luther on marriage, my dear. He has given the most beautiful picture of the nature and ends and duties of the wedded life you are ever likely to read.'

That was all he said; and so he turned again to his 'Defence of Transcendentalism.' Isabel, therefore, turned to her uncle: who but he—the kind and indulgent nourisher of her youth and friend of her maturer years—her all but father—should give her away? He was asked, and at once agreed, to perform the paternal office; and so Isabel went down to Lancashire to fulfil the time before her wedding, for she desired to be married from her uncle's house.

Meanwhile Mr Suffield had been getting through the business for which he stayed behind in London. He had arranged with the whip of his party to pair for the session and then to resign his seat. One important division he could not be paired for, and he remained a day or two longer than he had intended, to perform his duty to his party. There was another debate on Indian affairs—it concerned Opium this time—and his secretary, the Tame Philosopher, had prevailed on him to make a speech. He had written for him a most learned discourse, packed with words of the peculiarly Tame-Philosophic kind. Suffield sat down for a little in the Library of the House of Commons and wrinkled his brows over the sheets, but his thoughts would wander after his family and his affairs into Lancashire.

'I can make nought o' this!' he said, and rose, folding the sheets away in his pocket.

He went down into the House, and promising himself that he would not miss the night-train home, he sat and listened in a half-dazed condition to the droning and the buzzing, and grew weary of it all. One of the whips of his party came to him and asked him if he meant to carry out the desire he had expressed to speak on the question.

'Nay,' said he; 'I ha' nought to say. But I'll vote.'

Still he sat, and still the debate drawled and mumbled on—with an occasional screech or two—till eleven o'clock struck. There was no sign that the division was at hand; and he went to the whip and begged that he might be paired for the division, because he must hurry down to Lancashire on business. The whip looked coldly on him, but acceded to his request; and Suffield walked out of the House never to enter it again.

In the lobby he encountered the Tame Philosopher, hanging about in expectation of hearing his own rhapsodical and bombastical periods delivered by his patron.

'You are not going away!' he exclaimed in dismay.

'I am,' answered Suffield, cramming his oration into his hands. 'Thou'rt th' only man that can fitly deliver that fine composition. Keep it, my friend. This question, if I'm not mistaken, 'll come up again, and then thou mayst be in th' House thyself, and canst deliver it!'

He drove away to the station—he had brought his travelling bag to the House—and caught his train to the North. He entered a sleeping-carriage, and quickly put himself to bed. And as the train rolled away through the soft night, charged with premonitory whiffs and whispers of spring, the unbidden refrain kept rolling through and through his mind:

O the oak, and the ash, and the bonny birken tree,
They're all growing green in my ain countrie.

And at length he went to sleep, to awake in his own Lancashire.

And so the interest of our story fades from London; for the Tame Philosopher soon followed his patron back to the North—he could not live, he declared, 'without the solace of seeing my dear George Suffield, a true man's-a-man-for-a'-that'—and Doughty's existence was regularly merged now in Ainsworth's, the interest of whose life was now in Lancashire. Gorgonio was heard of no more; and as for Tanderjee and the blameless Daniel they had fitting punishments meted out to them at the Lancashire spring assizes for felony and for obtaining money on false pretences.

But before we say adieu to the excellent family that has largely figured in this story, let us see how they were affected by the revolution in their circumstances. They dwelt no longer in the noble old Holdsworth Hall: that had been let to a Dutch-German-French Jew who gambled successfully on the Stock Exchange. They lived in a modest, old-fashioned house on the border of the village which Suffield had built, George having rooms of his own in town, to be always in supervision of the City part of the business.

Isabel—who lived in her uncle's house till her marriage—could not but note with delight how he and her aunt renewed their youth. Both might have been held somewhat excused if they had expressed or shown regret for their lost wealth and position, and resentment against the necessity for returning to work, when they had thought that work was over, according to the doleful habit of people who have been 'reduced;' but neither of them behaved as the foolish people behave. They were busy, cheery, and harmonious by day, and by night they were wrapped

in the peaceful and profound sleep of the just and merciful. Suffield was up and into the works as early in the morning as his work-people; and Mrs Suffield was up not much later, and with her daughter and her maid-of-all-work setting her house in order and preparing breakfast. It was to Isabel a delightful and stimulating lesson in life to see how her aunt, the courageous, vigorous-minded woman who had held her own with duchesses and female politicians in 'the gilded saloons of greatness,' shone with all the virtues of the house-mother in the little Lancashire home, and was evidently at peace with herself and with the world.

'Of such,' thought Isabel, 'must be the women who have made Englishmen great with their peculiar quality of greatness!'

And it was not at home only that her aunt was active and helpful; she was also helpful and active in the village among her husband's people; for Suffield was not one of those employers who consider that their responsibility for their workers is at an end with the payment of their weekly wages. There were particularly gaffers and gammers upon whom the cold of Death was gradually creeping while yet they lived, who needed such comfort and encouragement as a wise woman can best impart: cheering words, and comforting food and drink. Isabel knew these pensioners from of old, who had so long benefited by the Suffield bounty that they had come to think they had a prescriptive right to the care of 'th' mester,' as most people think they have a right to the regard of Providence. Isabel went among these ancient, quaint creatures, alone sometimes, and then she heard how her uncle and aunt were regarded by them.

'Aw'm real glad,' said one gray gaffer to her, who was ancient enough to wear knee-breeches and coarse stockings, 'th' missus ha' come back—though they do say as how it's because th' mester ha' lost lots o' brass. Brass or no brass, hoo [she] is a rare un to mak' broth.—I set on my lass and owd Betsy to try to mak' th' broth; but, bless thee! they conna mak' it nohow.—Aw reckon th' missus has a special kind o' barley.'

Of 'th' mester' she heard more sympathetic commendation still. She visited an old woman supposed to be dying, who had in her time worked very hard and borne a large family of great sons, and who had known 'th' mester's' mother.

'Ay, aw knowed th' mester's mother,' said she to Isabel, while an attentive neighbour sat by—'as clean and nate a woman as could be, and as bonny and free-handed as th' mester himsen. When aw sit down i' th' Kingdom o' Heaven, aw'll ha' a good look round for th' mester's mother, to tell her how well th' mester's going on. Happen, aw'll clap e'en on her sitting right again' me; for we're fro' th' same village.'

'Happen,' said her neighbour, almost as old and quaint a creature as herself—'happen thou'll gi'e a look round and find out my owd John and tell him about Betsy.'

'Nay,' said the other; 'aw'll do nought o' th' sort!—Trapesing round to look for thy owd John! When aw get to th' Kingdom, aw'll just put me on a clean apron, and sit me down in th' first cheer, and rest me!—But aw'll look out for th' mester's mother!'

Thus work, peace, and contentment reigned in the Suffield home and throughout the village which Suffield had created and which depended on him. The only person who seemed at all sad and who occasionally sighed was Euphemia. And it presently became evident what was troubling her: not reduced circumstances, not the necessity of putting on an apron and performing the duties of a parlour-maid, but because her 'Beast' seemed to have ridden away, and because since she had not seen him her mind turned him into a Prince. When her father had to announce to Lord Clitheroe their contracted circumstances, she bravely—but with no terrible pang of heart—offered Clitheroe his liberty. He refused to accept it, although he anticipated that his father and mother would strongly object to his carrying out his engagement; he declared, however, he would wait and 'lie low'—by which he meant 'bide his time'—until the not very distant day when his invalid old father must slip out of the title and estates. From that day, Pheny had not seen or heard from her 'Beast,' and she began to think he must have ridden away indeed. Then, since she had not seen him dancing attendance on her, she had begun to long for his presence, and at length to be convinced that she loved him and was going to lose him—such being the wayward fashion of love with maidens of Euphemia's character.

But on a certain day a tall horseman with a big flaming-red beard, and a piece of crape on his arm, rode up to the Suffield door and alighted. It was the 'Beast-Prince' come to claim his bride: his old father was dead, and he had stepped into the empty shoes and inherited the empty title, and by right of his freedom now to do as he pleased, he had come to his lady-love. Euphemia welcomed him with more demurrance and at the same time with more fervour than she had ever before shown.

'Well, little one,' said he, 'you see I've come, now that I am free to do as I like.'

'I see you have come,' said she, with something of her old sauciness: 'you are a very noticeable fact;' but she refrained from calling him 'Beast' or 'Goose.'

'Come now,' said he; 'have you missed me at all? Tell me.'

'A little,' she answered: 'not much.' But her look was better than her words.

They were closeted together for a little, and then they came forth radiant. The new Earl of Padiham congratulated Isabel on her approaching marriage—of which, he said, he had just heard—and regretted that his own could not be celebrated at the same time. And so he rode away, and left Pheny as merry as a bird in the waking of dawn.

So almost before Isabel was aware—with these events and with preparations for the wedding—her marriage day was at hand. It seemed to suddenly leap out of the future into the present! Three days before it seemed still very distant; two days before it seemed only one day nearer than it had been the day before; then the gulf seemed to contract and disappear, and lo! they were at the morning of the very day, and Ainsworth was by her side!

George was absent: he had gone for a holiday; but he wrote a manly letter to Isabel, begging her

to believe that he stayed away from her wedding because of no feeling of estrangement, but only because he thought that his presence might embarrass the whole party. And with that he wished her and her husband—about to be—'happiness and prosperity.' The letter was simple and honest, and strove hard to be rid of all trace of self-pity or wounded vanity.

Suffield had declared a holiday at the works on the wedding day; and there was a great concourse in the church on that August morning, when the worthy man with tears in his eyes gave his niece away, and anon greeted her as 'Mrs Ainsworth.' But the most notable fact in connection with the wedding is that Mrs Suffield's wedding present to her niece was that very box, containing Uncle Harry's jewels and trinkets, which Isabel had turned over to her aunt not many weeks before.

And then—and then the married pair drove away into the new life which lay before them—the life of husband and wife, with its new cares and new burdens, its new duties and new responsibilities.

THE END.

OUTPOST DUTY AND 'SECRET SERVICE' IN WAR.

On the 19th of October, 1886, Lord Wolseley, by direction of the Commander-in-chief, issued a Memorandum to the general officers commanding military districts, in which it was pointed out that the Duke of Cambridge had recently noticed that 'many officers of all ranks evinced a considerable lack of information in those field-duties, such as outpost and reconnaissance work, a thorough and practical knowledge of which is vitally important to all military efficiency.' The Memorandum recalls that the yearly course of military training prescribed by the Queen's regulations was laid down with the object of affording officers sufficient opportunities of practising these duties and teaching them to their men; and that the Commander-in-chief had been disappointed to find that little progress had been made in this respect. The general officers addressed were ordered to impress upon officers commanding regiments or battalions that the Commander-in-chief held them personally responsible for the efficiency of their corps in every particular. The necessity of devoting a great deal more time and attention to the instruction of troops, especially in field-duties—'upon the proper and intelligent performance of which, in time of war, the credit of corps and the lives of men must in no small measure depend'—is very strongly insisted upon. Finally, the officers commanding the districts are requested themselves to see that corps under their command were frequently practised in outpost and reconnaissance duties.

The gravity of this severe rebuke will be understood when we consider the nature and duties of outposts. They act as the *feelers* of an army, it being their office to guard it from every danger, and keep it constantly informed of everything that can add to its safety or assist its move-

ments. It is their business to screen the movements of the army in their rear, and prevent any intelligence of its movements from reaching the enemy. The outposts thrown out to the front, to the flanks, and, when necessary, in the rear of a force in the field for its protection, are known in our service as 'outlying piquets;' whilst for reconnaissance duties we use patrols, varying in strength according to circumstances. All outposts should be as far in advance of the force they are thrown out from as they can be with safety; that is, without exposing them to be cut off or overpowered before assistance can reach them. A great military authority says that, 'as a general rule, five-sixths of a force should be able to rest in peace and quiet, whilst to the remaining one-sixth is allotted the outpost work. It is essential that they should be sufficiently far to the front to enable the Commander-in-chief, when he receives the report from them that the enemy is advancing in force, to make up his mind whether he will or will not fight; and if he decides upon fighting, to enable him to occupy the position he had previously selected to fight in, before the enemy could disturb him in the movements necessary for that purpose.'

Ignorance of outpost duty was a distinguishing feature of our officers in the Crimean War. It accounts for the blindness and feebleness with which Lord Raglan groped his way forward towards Sebastopol after the battle of the Alma. It is now known that he might have marched into the practically unfortified northern side, in the September of 1854, instead of besieging it, at an immense cost of blood and treasure, from the south side during two long and trying winters. The greatest possible attention is given to the efficient performance of outpost duty in the armies of Germany, Austria, and France, every officer, whether of cavalry or infantry, being made to study General de Brack's 'Light Cavalry Outposts,' which, although the work of one of Murat's old officers, is still accounted the best authority on the subject.

The most reliable method of obtaining information of an enemy's movements is by reconnaissances, which may be divided into four classes: (1) Reconnaissances in force, always conducted under or by order of the Commander-in-chief. (2) Those made by a detachment of all arms, of sufficient strength to protect themselves and secure their retreat. (3) Those made by staff officers, accompanied by small cavalry detachments; and (4) and last, those which are continually made by individual officers from the outposts.

One of the admirable light-cavalry officers of Napoleon, who distinguished himself in the third of these divisions, was Curély—Sous-lieutenant in 1807, and General in 1813—whose name I have not succeeded in finding in any civil or military biography. In 1806, says De Brack, Curély, 'being twenty leagues in advance of the army, at the head of twenty of the French 7th Hussars, carried terror into Leipsic, where were three

thousand Prussians. In 1809, when fifteen leagues in front of the division to which he belonged, and at the head of one hundred chasseurs and hussars of the 7th and 9th, he passed unperceived through the Austro-Italian army, which he was engaged in reconnoitring, and penetrated to the centre of the staff of the Archduke, the Commander-in-chief. In 1812, at Solosk, at the head of one hundred chasseurs of the 20th, he carried off twenty-four guns from the enemy, and took prisoner the Commander-in-chief of the Russian army. When services such as these can be rendered by a Sous-lieutenant of cavalry, the reader may understand the significance of the 'Memorandum' issued by Viscount Wolseley.

I think we may match Curly or any of the officers mentioned in General de Brack's work with the celebrated Colquhoun Grant of the Peninsular War. It was of Grant, as an 'exploring officer,' that Wellington said that 'no army in the world ever produced the like.' When Marmont came down on Beira in 1812, and was supposed to contemplate a *coup de main* against Ciudad Rodrigo, Wellington sent Grant to watch him. Attended by Leon, a Spanish peasant of fidelity and quickness of apprehension, who had been his companion on many occasions of the same nature, he arrived in the Salamancan district, passed the Tormes in the night, and remained in uniform—for he never assumed any disguise—three days in the midst of the French camp. He obtained exact information of Marmont's object, and more especially of his preparation of provisions and scaling-ladders, notes of which he sent to headquarters from hour to hour by Spanish agents. On the third night some peasants brought him a general order addressed to the French regiments, saying the notorious Grant being within the circle of their cantonments, the soldiers must use their utmost exertions to secure him, for which purpose also guards were placed in a circle round the army. Nothing daunted, he consulted with the peasants, and before daylight next morning entered the village of Huerta, close to a ford on the Tormes, and six miles from Salamanca. A battalion was in Huerta; and beyond the river, cavalry videttes were posted, two of which constantly patrolled backward and forward for the space of three hundred yards, meeting always at the ford. When day broke, the French assembled on their alarm post, and at that moment Grant was secretly brought opposite the ford, he and his horse being hidden by the gable of a house from the infantry, while the peasants standing on loose stones and spreading their large cloaks covered him from the cavalry. There he calmly waited until the videttes were separated the full extent of their beat, when he dashed through the ford between them, and receiving their fire without damage, reached a wood, where the pursuit was baffled. Leon being in his native dress, met with no interruption, and soon rejoined him.

He had before this ascertained that means to storm Rodrigo were prepared, and the French officers openly talked of that operation; but to test that project, to ascertain Marmont's real force, and to discover if he was not really going by Perales to the Tagus, Grant now placed himself on a wooded hill near Tamames where the road branched off to Perales and to Rodrigo. There lying perdue until the French passed by in

march, he noted every battalion and gun; and finding all moved towards Rodrigo, he entered Tamames, and discovered they had left the greatest part of their scaling-ladders behind, thus showing the intention to storm was not real. This it was which allayed Wellington's fears for that fortress.

As a purveyor of intelligence, Colquhoun Grant was of more use to the British army in the Peninsula than all the cavalry officers under Sir Vincent Cotton, Lord Uxbridge, and Lord Edward Somerset put together. His unrivalled mastery of French and Spanish, both of which he spoke 'like a native,' enabled him to penetrate wherever he pleased. Scorning to wear any disguise, he would often spend days in the French camp wearing the British uniform, which his unsuspecting comrades supposed he had picked up on the battle-field and substituted for his own. His adventures were extraordinary; but it would be manifestly out of place to follow them in the present paper.

In the Austrian wars of Napoleon, the French bivouacs were sometimes visited by Jews, who asked leave to purchase the skins of animals slaughtered for the soldiers' food. These men were spies, a 'secret service' which renders invaluable assistance to the general in time of war. Wellington had numerous spies within the French lines, even at the headquarters of Marshal Victor. The greater number were Spanish gentlemen, alcaldes, and poor men who disdained rewards, disregarded danger, and were distinguished by their boldness, their talent, and their integrity.

But the spies I have especially in my 'mind's eye' were officers—English and French—of singular boldness and sagacity—such as John Grant, Major in the Portuguese service, often confounded by the French—especially by Marmont—with Colquhoun Grant, already alluded to. It is to be regretted that the adventures of this ill-requited officer, who was allowed by the English War Office to die in sordid poverty and neglect, were never preserved, for they must have been indeed extraordinary. Men of this sort carry their lives in their hand, for, by the laws of war among all civilised nations, a proved spy is summarily put to death.

As a fitting conclusion to this subject, I give the following on the authority of the late General Cavalié Mercer, Royal Artillery, 9th Brigade, at that time captain of a troop of horse artillery. It occurs in his 'Journal of the Waterloo Campaign': 'It was on the evening of the 15th of June (1815), and about sunset, or a little later, that an officer of hussars rode into the little village of Yseringen, Leathes [an officer of horse artillery] being at the time at dinner with me at our château. He was dressed as our hussars usually were when riding about the country—blue frock, scarlet waistcoat laced with gold, pantaloons, and forage-cap of the 7th hussars. He was mounted on a smart pony, with plain saddle and bridle; was without sword or sash, and carried a small whip—in short, his costume and appearance were correct in every particular. Moreover, he aped to the very life that "devil-may-care" nonchalant air so frequently characterising our young men of fashion. Seeing some of our gunners standing at the door of a house, he desired them to go for their officer, as

he wished to see him. They called the sergeant, who told him that the officer was not in the village. In an authoritative tone he then demanded how many men and horses were quartered there, whose troop they belonged to, where the remainder of the troop was quartered, and of what they consisted. When all these questions were answered, he told the sergeant that he had been sent by Lord Uxbridge to order accommodation to be provided for two hundred horses, and that ours must consequently be put up as close as possible. The sergeant replied that there was not room in the village for a single additional horse. "Oh, we'll soon see to that," said he, pointing to one of the men who stood by. "Do you go and tell the *maire* to come instantly to me." The *maire* came, and confirmed the sergeant's statement; upon which our friend, flying into a passion, commenced in excellent French to abuse the poor functionary like a pickpocket, threatening to send a whole regiment into the village; and then, after a little conversation with the sergeant, he mounted his pony and rode off just as Leathes returned to the village. Upon reporting the circumstance to the officer, the sergeant stated that he thought the man had appeared anxious to avoid him, having ridden off rather in a hurry when he appeared, which, together with a slight foreign accent, then for the first time excited a suspicion of his being a spy, which had not occurred to the sergeant before, as he knew there were several foreign officers in our hussars, and that the 10th was actually then commanded by one, Colonel Quentin. The suspicion was afterwards confirmed; for, upon inquiry, I found that no officer had been sent by Lord Uxbridge on any such mission. Our friend deserved to escape, for he was a bold and clever fellow.'

PHYLLIS MARSDEN'S LOVE-POEM.

By LOUIS HAMILTON.

IN THREE CHAPTERS.—CHAP. I.

THE Marsdens had lived in the same house a long time, a very long time. About that there could be no dispute, seeing that three generations of Marsdens had been born and had died there. It was preposterous, the fourth Phyllis argued within herself, as she stood flattening her pretty nose against the window of her own sitting-room, on which the rain beat so thickly as almost to obscure the pleasant view of an old-fashioned garden below—it was nothing short of ridiculous folly to suppose that a house which was good enough for the Marsdens in 1780, when, as all the world knows, they first set up their great pottery in Stockwell, could be a suitable dwelling-place for that same family when a hundred years of prosperity had brought distinction to it in a dozen different ways.

It was roomy enough, of course! 'Bless me!' reflected Phyllis, with a shrug of impatience, 'that is not the drawback! There are half-a-dozen rooms, I daresay, that I have not entered since I was a child—damp, nasty, dusty places. If I had my way, I should pull down half the house; and cut all the living-rooms in two by building walls

across them. Then we might be comfortable. At least we should have one room, one climate; and not change torrid heat for Siberian winter every time we get up from our chairs to fetch a reel of cotton.'

She drummed on the glass with her fingers, and in a few minutes broke out again.

'There are Kate and Evelyn at the Deanery, as comfortable and jolly as possible, always going out to balls and tennis parties, and—and—things. And Georgie's life just makes me rampant when I think of it, with half her father's regiment always sending her flowers, and teasing her for dances, and making picnics. And here am I, the third family of cousins, with no brothers or sisters to cheer me up, left in this dreary place, without a single nice family in the neighbourhood.'

There were drops of water on both sides of the glass as Phyllis reached this point in her reflections, but she brushed them away defiantly. 'I don't care!' she said. 'I will be cheerful in spite of them all. I'll do something pleasant. What shall it be?'

She mused a little longer, and then turning away from the window, she began to pace up and down her spacious room.

'If I don't cease looking out of window, I shall be cross very soon,' she said fretfully. 'That constant splashing and dripping is enough to wear out any one's nerves. I don't suppose Papa minds it? Does he, I wonder? I'll go and see!'

The idea seemed to amuse her. She laughed a little laugh, patted her hair before the glass, and drawing herself up to the full height of her little figure, she walked with stately steps out of her room, and down the winding staircase, stopping with affected carelessness to look out of the tall window half-way down the flight. As she crossed the hall, she hesitated, and looked a trifle frightened; but recovered herself almost immediately, knocked at the door before her, and went in without waiting for an answer.

A man past middle life was sitting at a writing-table, littered all over with books and manuscripts. He looked up as Phyllis entered, and a frown was on his face. 'I did not say "Come in,"' he said sternly.

'Did you not?' rejoined Phyllis, with a fine air of surprise. 'Oh, how sorry I am! Well, but I could not suppose you would wish to be alone on such a miserable day.'

Then, finding no further rebuff forthcoming, she drew a stool near her father's chair, and rested her head against the arm.

'It really is weather in which people ought to stand by each other; don't you think so, daddy?' and Phyllis looked wistfully up at her father. 'For I couldn't bear to sit down comfortably in my pretty room up-stairs, and think that you were dull and worried by yourself down here. So I came to see how my daddy was getting on.'

Mr Marsden moved uneasily in his chair. Above all things, he disliked being interrupted

in his work; and probably on any other day he would have had no scruple in telling his daughter he wished to be alone. But to-day the ceaseless rain and dreary outlook had not been without its influence on his spirits; and that, combined with the pleading look on Phyllis's face, made him answer almost amiably: 'Well, well! perhaps it is!' And with a sigh he pushed aside a large pile of manuscripts that lay on the table before him.

'Why, daddy, you get busier every day!' said Phyllis, noting the movement. 'How I do envy you your writing on a day like this! Let me see what you're doing.' She picked up a tattered, old, leather-bound book which lay at her father's elbow. The characters were strange to her; and she knitted her pretty brows and pursed up her lips as she turned the book first one side up and then the other. 'What a queer old book, daddy! And what funny writing—all curls and dashes and dots! What language is it?'

'Persian,' replied Mr Marsden, wheeling round his chair. 'That queer old book is exceedingly rare, and contains the love-poems of a writer whose name would tell you nothing if I repeated it.'

'That means that he has forgotten it,' observed Phyllis to herself. 'But love-poems, daddy—that really is interesting! Are you going to translate them?' And she patted the old book with quite a loving gesture.

'I am going to try,' replied Mr Marsden, modestly. 'Indeed, I have already finished several; and as you seem tired of your own society, perhaps you would like to stay here a little, and I will read some to you. Possibly your observations on them may be of use to me.'

'Oh, yes! I am sure they will!' exclaimed Phyllis. 'Because I know so much about such things.'

'Do you indeed?' said her father sharply. 'Pray, how and where did you acquire this fund of information?'

'Oh, well, not really, you know! I didn't mean actually, of course,' explained Phyllis in a great hurry. 'Books you know, and stories, and things tell one such a lot.'

'Umph!' said her father, only half satisfied. Then he drew out his sheets of manuscript, turned to the light, and began to read, while Phyllis, with an air of demure propriety, seated herself on a stool before him.

'My beloved is fairer than the white rose of morning. Softer than the antelope's is her eye when she gazes on me. I rose in the night and stood beside her tower.'

'Oh!' cried Phyllis, with a little gasp of shocked astonishment.

Her father bent his brows at her, but went on reading. 'The night was cheered by stars, but in my heart is deepest blackness. Bitter are the waters of thy spring, oh Zoar-Azra! They are sour and bitter in the mouth, and the heart rejecteth them. But affection spurned is sourer still; and beside it Zoar-Azra is as honey mixed with sweet oil.'

'How very nasty!' murmured Phyllis, but her father did not hear her.

'Spurn me not! oh daughter of the mountains!' he read, raising his voice as he came to the loftiest portion of the composition. 'Thou

whose voice is as the enchanting murmur of soft waters heard at evening amid the breath of roses, which light winds carry from the distant walks of winding gardens, heard in silence, broken by no footfall, nor the gentlest rustling of the softest leaf which buds in spring-time on the juniper tree, thou whose hair is'—

'Oh! Ugh! Augh!' yawned Phyllis. 'Papa, I beg your pardon. You know I do think your Persian love-songs disappointing. Poor girl, she would never have stayed to hear all that. Now, when you want to make love to a girl'—

'Thank you!' said Mr Marsden grimly, as he replaced his manuscript in a drawer and locked it up. 'I will not trouble you to tell me what I should do in that very improbable event.—Go away, Phyllis; you are evidently not interested.'

'Indeed, I am afraid not!' sighed poor Phyllis. 'But oh! I am so afraid I have vexed you! Is there nothing more interesting in your funny old book?'

'Nothing that would appear so to you.—Be good enough to leave me now! Robins will let me know when lunch is ready.'

'Oh dear!' sighed Phyllis as she ran across the hall. 'How very hard it is to amuse people when they are old. And I did try so hard not to yawn. Poor daddy, I think he was rather hurt. Shall I come to that when I am old, I wonder? Oh, I do hope not. But I must be very careful not to let the taste for Persian love-poems grow upon me.'

By this time Phyllis had reached her own room, and had thrown herself into a large deep chair beside her fire. 'Love-poems,' she mused—'love-poems are not necessarily Persian. English love-poems would be much nicer.' Not all about roses, and bitter springs, and winding walks. No, not at all! Nice, sensible, straightforward love-poems, just like what a nice man would say! But what would he say? What should I say, if I were a man, and wanted to talk poetry?

She lay considering for some time; and then, with a pencil and paper, endeavoured to write some of the nice love-songs she had imagined. But at first the words would not come; and when they did come, they would not arrange themselves. So in a little while Phyllis threw her pencil down, went to her piano, and played waltzes, with a secret hope that the luscious harmonies might be heard in the study downstairs, and infuse a little warmth into the ancient Persian verses.

When the luncheon bell rang, she went down humming to herself one of the airs she had been playing, and took her seat opposite her father with a pretty unconsciousness of the frowns he cast towards her.

'Papa,' she said at length, having failed in several efforts to draw him into conversation, 'I think of going to see Kitty this afternoon'—then she added, hesitatingly—'if you do not particularly want me.'

'Mrs Huxtable!' said Mr Marsden, interested at once. 'Is her brother at home yet?'

'No; I think he is in Scotland. Shall I remind Kitty that you want to see him?'

'Pray, do no such thing! I presume my acquaintance is of as much value to him as his can be to me. If he comes to call upon me, I

can put him right about several theories he seems to have formed, and direct him to a course of inquiry which may be profitable to him when he returns to Persia. If he does not care to seek that advantage, that is his own affair.'

Phyllis made a mow, under the shelter of a decanter, but said no more. Only, when she rose to leave the room, she stopped by her father's chair and threw her arms round his neck. 'Don't be cross with me, daddy,' she said—'don't be cross with me. I can't help not being clever, you know; and I do love my old daddy, though I plague him so.'

'I'm not cross!' said Mr Marsden, softening—'that is, not very cross.—Well, well; not at all cross. There, get along, little plague! Leave me to finish my claret.'

'But I want you to show you're not cross,' said Phyllis, still hanging round his neck. 'Let me copy your poems out nicely for you. You know I can write a nice clear hand, much better than yours! Let me copy them. Ah! do—then I shall know I'm not in disgrace.'

'Foolish child!' said her father, pinching her cheek. 'You shall have the poems. But be very careful of them. If anything were to happen to them, nearly six months' work would be lost.'

'I'll take the greatest care possible! Oh! you dear old daddy.' And Phyllis ran off radiant.

Half an hour later, she was in a hansom, being whirled rapidly across the river to a quiet square in Kensington, where she was dropped on the steps of a roomy old house, which looked as if all its life it had sheltered dowagers of irreproachable family. The servant who let her in smiled as if he knew her; and Phyllis, nodding and smiling in return, ran lightly up the stairs.

As she laid her hand upon the drawing-room door she paused, for at that moment there issued from within the sound of a deep, man's voice raised in a kind of croon, which sounded inexpressibly odd:

There was an old woman all skin and bone,
Such an old woman was never known.

These words the voice chanted, wofully out of tune; when the further adventures of the old woman were cut short by a much more youthful voice which interrupted, saying with decision: 'I don't like people all 'kin an' bone. Sing "Wing, wang, waddle oh!"'

'Pon my word, Dickie,' said the older voice, 'I'm afraid I don't know that song.'

Phyllis listened with a laughing face, turned as if to go, blushed, hesitated, and then suddenly opened the door and went in. She found a tall, fair-haired man sitting with a little boy astraddle on his knee, looking the picture of discomfort and embarrassment. A younger boy was sitting on the ground between his legs, nursing a green parrot, and causing no trouble to anybody, except when he tried to swallow it, or to wedge his head between the bars of the chair. The moment they saw Phyllis, they started off to meet her, and while the younger one clung to her skirts, the elder boy leapt straight at her, crying out: 'Oh! Auntie Phyllis, he can't sing one bit!'

'Sh! Dickie!' said Phyllis as she kissed him. 'You mustn't be rude.'

'Indeed, Miss Marsden, Dickie is quite right,'

said the young man.—'And permit me to say I am very glad to see you.'

'You look glad, certainly,' Phyllis admitted. 'May I ask where Kitty is, and why you are left in charge of these little people, who seem to be quite too much for you?'

'Too much indeed! I've never spent such an anxious afternoon in my life. The nurse is ill, or dead, or gone to the pantomime—I don't remember what exactly; and Kitty's gone to lie down with a headache. I believe she did it on purpose to see what I should do.'

'Very possible, I should say,' observed Phyllis. 'That corresponds also with my idea of Kitty's character. I should not wonder if you were right. And what *did* you do?'

But before this question could be answered, Dickie interposed. He had climbed on a chair, and jumped down to the ground ten times in succession; and being somewhat exhausted by this feat of agility, he came over to Phyllis, put his knees on her lap, and said in a pleading voice: 'Please, Auntie Phyllis, sing "Wing, wang, waddle oh!"'

'Not now, Dickie,' said Phyllis, trying to put him off. 'Another time, dear.'

'No, now!' pleaded the boy.

And Captain Benson, with an anxious face, added: 'Indeed, Miss Marsden, I think you had better, if you can, and don't mind very much; for Dickie will never be satisfied until you do.'

'But I am not going to stay! I am going home!'

'For mercy's sake, do no such thing!' cried her companion. 'If you are naturally cruel, remember that you may be in need of help yourself some day, and don't leave me in this emergency.'

'Upon my word!' said Phyllis, shrugging her shoulders, 'what helpless creatures men are!—Yes, Dickie, I'll sing to you, my birdie, as long as ever you like.'

So she sang:

Wing, wang, waddle oh!
Sing, sang, saddle oh!
Fly away, pretty boy!
Over the moon,

to the huge delight of the children, who laughed, and clapped their hands.

Then Dickie said, nodding over towards Captain Benson: 'You listen, and see how she does it!'

'All serene, Dickie,' was the reply; but Phyllis looked annoyed.

'Wouldn't you like to go and smoke, Captain Benson?' she asked.

'I want to learn the art of entertaining children,' he said. 'Pray, go on.'

So Phyllis sang another song, and then another; and then, espying a box of bricks in a far corner of the room, she led the children over there and set them to work to build a temple. Leaving them immersed in this labour, she returned towards the fireplace, and sank into the chair which Captain Benson set for her.

'I thought you were in Scotland still,' she observed, after a pause.

'I did go to one or two places after leaving Dunveith; but they were all very dull. I sup-

pose it was having such a jolly time there that made the other houses seem dull.

'Perhaps,' Phyllis assented. Then she added: 'Alice Markham told me she had never in her life been so bored as she was at Dunveth.'

'How very strange! I thought it such a delightful time. Didn't you?'

Phyllis hesitated. Just at that moment there came a crash, a scream from the children, and the sound of breaking china.

'Goodness gracious me!' cried Phyllis.

'What on earth have the little wretches done!' exclaimed Captain Benson; and they hurried over to the scene of the wreck.

A FAITHFUL TRAITOR.

THE 25th of March 182— was marked by a thaw succeeding a severe frost of three weeks' duration. At Lenham Court, a mansion situated fifteen miles or so from London, on the west side, great inconvenience and some damage had been caused by the bursting of a water-pipe during the day. In especial, one room was rendered so damp that its usual occupant 'Spencer'—Lady Brown-Salter's lady's-maid—was compelled to change her sleeping-place. Instead of sharing one of the housemaids' beds, she chose, with her Ladyship's permission, to make up a bed for herself in the small room, or large cupboard, situated at the end of the corridor which runs through the whole breadth of Lenham Court on the first storey. It was a room used to store trunks and boxes in, and Spencer placed some of these as a foundation for her couch. Many of these trunks had made the voyage to India and back, for Colonel Sir William Brown-Salter had distinguished himself not a little in John Company's service. There had been much extra work for all the servants at Lenham Court that day, and it was late before Spencer retired to her cupboard.

On getting into her bed she found her novel couch by no means so comfortable as it looked. It had to be rearranged; but on extinguishing her candle a second time, she found herself as far from sleep as ever. While she twisted and turned, she heard the stable clock strike two; and immediately afterwards she became conscious of a subdued sound outside her door. Remembering the jokes at her expense at the supper-table about the size of her bed-chamber, it occurred to Spencer that her fellow-servants might be going to play her a trick, or indulge in some practical joke. So she slid from her uneasy couch, and removing the key from the lock—she had locked herself in on coming to bed—she applied her eye to the keyhole. The door, as we have said, faced directly the whole length of the corridor; about two yards from her stood a man, but not one of her fellow-servants; he held a lighted candle in one hand, shading it with the other so as to cast the light now here, now there. His face was concealed by a mask of black crape, and he was listening intently. A breathless minute or two passed, and, as if by magic, there

were either two or three other men in the corridor, all masked in crape, behind which their eyes shone in the candle gleams. They went and came and consulted, noiseless as so many spectres. In and out of the rooms, locking doors softly behind them, now ascending to the third storey, now descending to the basement; now the one holding and shadowing the candle was left alone again.

Spencer drew back from the keyhole a moment, trying to think if there was anything she could do. Sir William's room gave on to the corridor—he must be murdered, thought poor Spencer, or surely she would have heard some sound, for he often sat late reading, and it was round his door that the thieves were clustered. He was a passionate man and a powerful, beloved by his servants for his bounty, though feared on account of his temper. Surely he would have made a fight for it, if he had not been taken at some cruel disadvantage. What could she do? The alarm-bell, even if she could muster courage to try and get to it, was quite at the other end of the house. Applying her eye once more to the keyhole, she was terrified to find not only darkness, but in the darkness, some one breathing close to the door. Then the handle brushed her cheek as it was softly turned, and lock and hinges were strained by the silent pressure brought to bear on them to such a degree that instinctively she drew back, expecting the door to be forced in upon her. The door creaked as the pressure relaxed, and just then the stable clock struck three.

As the minutes passed and silence was unbroken, Spencer gathered courage to look from her spying-place. The watchman stood alone, candle in hand, in his former place. She became stiff and cold at her post; nothing moved that she could hear or see, except that the man trimmed his candle now and then with his fingers, and turned his head watchfully from side to side, his eyes gleaming behind his mask, and seeming now and again to fix themselves on her lurking-place. At a low whistle from the basement, he and his light vanished together. Taking the precaution to stop up the keyhole, Spencer struck flint and steel till she obtained a light, then huddled on a few clothes, inserted the key, turned it, stood one minute outside, in silence and darkness, then snatching up her candle, made a rush for the only open door in the corridor—it was her master's.

Bound hand and foot to a chair, and gagged, was Sir William. The room was in the wildest confusion—boxes, caskets, chests, all turned upside down, and their contents scattered indiscriminately on the floor. Her Ladyship was in bed, bound and gagged too. With nimble fingers Spencer set to work to free her master. No sooner was this accomplished, than, speechless and foaming at the mouth, Sir William staggered out of the room, and, to her dismay, she heard him descend the stairs. Having released her mistress, the lady's-maid next hurried to the rooms of her fellow-servants, on all of whom the keys had been turned after they had been threatened with instant death if they uttered a sound. They were

soon released ; and the men-servants descended in a body to the ground-floor in search of their master. Here everything was in disorder. On the dining-room table were the remains of the thieves' supper ; but Sir William as well as the depredators had vanished. The groom returned from the stables with the news that his master's favourite hunter was missing. There was no doubt now that he had gone single-handed in pursuit of the thieves—as was indeed the case.

Concluding that they were from London and were returning thither, Sir William had saddled his hunter and started without an instant's delay, save to arm himself with a couple of pistols from the stand of arms in the hall. When he reached the head of the avenue, three-quarters of a mile from the house, he dismounted to open the heavy gates. Then he perceived, in the dawning light of the chill March morning, a strange dog sitting shivering inside the gates, unable either to surmount or pass under them. He concluded at once that the cur belonged to his late visitors, and that, having stayed behind, either for his supper or in search of game, his retreat had been cut off by the closing of the gates. He resolved to follow the clue thus given him, and was confirmed in his resolution when, the gates being opened, the animal scoured away, with his nose to the ground, in the direction of London. Away went the dog, and away galloped Sir William, keeping an eye upon him always. It was broad daylight when the three reached the outskirts of London, and Sir William was hailed by a voice he knew well. It was that of the Major of his late regiment.

'Hullo ! Colonel, where are you off to so early ?' Major Higgins was on his way home after a night's play at Brooks's.

'Turn your horse's head and I'll tell you,' returned Sir William through his set teeth. The idea of communicating his losses and the indignity, he, an old soldier, had suffered, sufficed to make the blood, which his swift ride had kept at fever heat, boil again.

Major Higgins did as desired ; and putting his horse to the gallop, received, in as few words as possible, the news of the night's occurrences at Lenham Court, as he and his old Colonel made their way side by side through Oxford Street and the Strand, never once losing sight of the mongrel that was, he fancied, to be the clue to the recovery of his property. Dodging and winding his way among market carts and huckney-coaches, the dog, never once relaxing his speed, diverged into by-streets and lanes, until he disappeared up a court in Leather Lane.

Dismounting, and giving their horses in charge to a lad, and having impressed a watchman into their service, they advanced up the court in single file. Sir William led the way, a cocked pistol in either hand ; Major Higgins, who came next, was unarmed ; the watchman brought up the rear in a leisurely way, that showed him by no means thirsting for the fray. Doorway after doorway was examined, but the cur seemed literally to have vanished. In an angle of the *cul-de-sac* into which they had entered, Sir William at last discovered an outside wooden staircase. Despite the remonstrances of his companions, he persisted in creeping cautiously up the crazy stairs. There, curled up at a door, and apparently

fast asleep, lay the clue who had so faithfully but unconsciously guided him to his master's lair.

A summons to open the door met with no response. Sir William, to whom anger and excitement gave additional energy, put his knee to the door, and bidding Major Higgins 'Duck !' as he did so. The door yielded with a crash ; a shot passed over the lowered heads of the two officers, and took effect in the cocked-hat of the watchman. A short scuffle, and the thieves saved their lives by surrendering at discretion to Sir William's pistols. On a table in their midst was spread out the whole of the 'swag ;' not an article was missing. A presentation sword of Sir William's, the hilt of which was thickly crusted with gems, was the only part of the booty that had met with ill usage ; but every diamond, ruby, or emerald that had been knocked from its socket still lay on the worm-eaten table, and was, before many days were past, restored to its accustomed bed. A few bruises and dints in the metal-work of the hilt remained, and these Sir William would show with great glee in after-days, telling how the good sword was lost and won ; while, as to the dints and notches on the blade, gained in a more legitimate warfare, the good Colonel could scarce ever be got to speak a word.

GHOSTS.

WHEN the brilliant hues of the sunset fade
Into amber and paly gold ;
When the wren and the robin sleep in the glade,
And the shepherd shuts his fold ;
When the lamps are lit in the deep, blue skies,
And the toil of the day is done—
Pale, haunting ghosts of the past arise
From the shadows one by one.

The ghost of the words we did not say
In the days for ever fled,
Comes out of the shadows dim and gray ;
And the ghost of the words we said,
Of the cruel word, of the bitter word,
Of the word of blame or scorn,
That was keen as the point of a warrior's sword
On a fateful battle morn.

The ghosts of the woes of age and youth,
That we passed unheeding by ;
Of the griefs we did not ask to soothe,
Of the tears we did not dry ;
Of the ills of which we took no heed ;
Of the grievous wrongs unfought—
Come with that of many a churlish deed,
Or of good deed left unwrought.

They cluster round us, these phantom shades,
These ghosts of the days of old,
As the cheerful glow of the daylight fades,
In the twilight dim and cold ;
And in vain we moan, and in vain we weep,
And we may not from them hide ;
Closer and closer these shadows creep
In the twilights to our side.

ON ANXIETY.

ALL who survive childhood feel the grip of Anxiety at some time and under some form; for, if a man be not anxious from care and business, he will be anxious about his pleasures and indulgences. Anxiety is as searching as the east wind; it pierces into the marrow of our bones, finds out a weak spot, and chills it only to inflame it into a fever—an intermittent fever, however. Intense anxiety is hardly consistent with a persistent ill-fortune: resignation—a mild despair—comes to the relief of the man constantly cast down by ill-luck, and he ceases to kick against the pricks. Hoping nothing, expecting nothing, he fears little. The essence of anxiety is a feverish hope; its quintessence, a sickening fear. The atmosphere of anxiety is uncertainty; its food, suspense. It carries a keen chisel, and carves men's countenances into more wrinkles than all the greater passions put together; while its acid bites into their minds, leaving channels into which fear will run so long as their lives last.

Though a man be so fenced about that for himself he need entertain no anxiety, yet if he be of any magnanimity of soul, anxiety will creep into it for the sake of others. In vain does man strive to forecast the object of his doubt: while watching the east, in all probability his dread will be stealing upon him from the west; if he looks to the north, behold! his fear has found him out, creeping upon him from the south. Or he may teach a cause for anxiety to appear by dreading it; for courage to overcome a devouring fear of the future is as necessary as putting on a bold front in the presence of a wild beast. This is one reason why it should be as much as possible repressed. Another and stronger one why it should be zealously guarded against is, that it clouds and dims the mind, as fasting or ill food subdues the body. And so we become open to an infection, capable of ill thoughts, weak enough to entertain sick suspicions, which would gain no admittance in a healthier state of being.

An anxious night—who has not passed it? For anxieties, like bats, fly best by night. As the twilight falls, how insidiously an anxiety flits into the mind, scarcely troubling us at first—still, it is there. By-and-by, as the gloaming deepens into darkness, the creature brushes past our face, and rouses us with a start to a sense of its presence, filling us with a nameless dread. We coax ourselves into a doze, only to be awakened to a consciousness that the vampire has settled and is sucking our lifeblood. No more sleep for us: we toss and tumble from side to side; the flitting bat-wings of the trouble, and our sighs, the only sounds disturbing the darkness. Now is the time for an exorcism: we try it, and listen fearfully. All is still. Has the enemy departed? For ten panting seconds we believe it has; till a sudden sinking of the heart—a sudden inrush of thoughts and fears that kindle fears, 'an indistinguishable throng'—warns us to put aside all vain notions of reprieve, all hope of release for this one while. We have compared troubles to bats; and when bats have once entered a room, they are difficult of dislodgment; despite drivings to and fro, beatings up and down, they swoop silently and uninjured from wall to wall, just managing to elude their pursuer. An open window and a light outside is a better remedy than all the buffetings within the house; so, to open the window of our mind and let our anxiety flit out into the light of another man's understanding, to tell our fearful anticipations to a friend, is more likely to bring relief than the battering of it up and down in our dark and ruffled minds.

A man may be anxious by habit, or by temperament, or, still oftener, by ignorance; and all these things, like mist, by confusing the outline of an object, magnify it. When a man has suffered anxiety silently and, as the event proves, needlessly, he draws a long breath, and dismisses it wholly from his mind: he was mistaken, that was all. But should his anxiety have been aroused by another needlessly, he feels himself at liberty to despise his prognostications hence-

forth—without, however, suffering his opinion of his own wisdom to be impaired by a perhaps similar error of judgment. But then, no one but himself knew of *his* mistake, and we live so much in what we think to be other people's opinion of us, that what they do not know is comparatively easy for us to forget. Many nourish a secret dread of naming a fear, lest a whispered word may bring it—like an avalanche, unsettled by a breath—down upon their heads. Others, impatient of suspense, unable to wait with steady nerves to pay their debt in due season, hurry the toll into the reluctant hand of the grim collector: of these are suicides. It is not despair—certainty—that unnerves a man, so much as a prolonged uncertainty; events inclining now this way and now that, until the balance of the strained and anxious mind is lost.

Yet it is exactly the mingling of hope and fear that forms the most powerful stimulant to energy and exertion of which human nature is capable. Under its influence men are goaded to excel themselves. Nay, more, without it, the joys of life would be robbed of half their poignancy. Who is it, think you, that relishes the desire fulfilled, like the man who has experienced hope deferred? There is no one object on which our minds are greatly set, from which all spice of anxiety can be completely banished. The Indian shooting the rapids in his frail canoe feels it, and it adds a thrill of pleasure to his sense of the audacity of his venture; the statesman perorating to the House on a question by which his Cabinet is prepared to stand or fall, feels it running tingling through his veins, adding fire to his imagination, lending eloquence to his tongue. The gambler is so enamoured of its power to brace up his relaxed and over-stimulated nerves, that to its delirious enjoyment he will sacrifice state and station, mankind's and his own esteem, and think the madness cheaply purchased.

Life without the joy of mingled hope and fear, without anxiety, would be a stagnant pool deprived of the spring that keeps the waters running and sweet, and relegating this 'pleasing anxious being' of the Western world to the Oriental calm of fatalism. When the current of life runs slow, when weeds gather on the surface and crowd the depths, we are in danger of yielding to the strongest temptation that besets a life free from fear, unflavoured by hope—namely, the danger of yielding ourselves to the power of the *vis inertiae*; shut up in ourselves, our fancies, our ailments, our own affairs, lost to all use, like Merlin in the forest under Vivien's spell, sunk in sloth, and the 'sweet reasonableness' of doing nothing when nothing apparently needs to be done.

There is a story told of a respectable tradesman, who, having attained the dignity of the *dolce far niente*, confessed to a friend of his that the happiest month in the year to him was the month in which his fit of the gout came on: it gave him something to think about. Let the man—himself on the rack of anxiety and envying the ease of another man's leisure, perhaps—remember, when enduring his own pangs, that a state of mind which entertains neither hope nor fear, which holds out no inducement to activity, is a state bordering on the greatest misery. Moreover, if a man be possessed of a strong mind, he

recognises the fact that this anxiety, so painful to endure, this hoping for the best and preparing for the worst, is the very process by which he may attain the cautious sagacity necessary for the conduct of affairs; his fear has taught him prudence, hope has been productive of patience, both have nourished activity, and the doubt, distrust, and dread of the future, implanted by nature or circumstances, he has learned to moderate by cultivating courage, patience, and cheerfulness; his reward being that feeling of calm, dignified pleasure, which has made it so well worth his while to labour for their attainment.

We have spoken of the Oriental calm of fatalism, such as that which 'Eöthen' attributes to old Shereef, sitting by the bivouac fire, 'unknowing where he was, or whither he might go, unknowing of all geography, but trusting in the goodness of God, and the clenching power of fate, and the good star of the Englishman.' But Oriental ignorance and fatalism, though coupled with trust in God, are not so impressive as that trust in God which is coupled with an absence of superstition, with knowledge, and with courage and self-reliance.

POMONA.*

CHAPTER XIII.

And the blossoms that bask in the sunshine
So wanton and fair,
For the apples which wait on their beauty
Have never a care.

EMMA RHODES.

It was the private view day at the Royal Academy, and such a lovely day too, as if Nature wanted to show that there was no flattery in all the beautiful landscapes that adorned the walls. Spring was early that year, and April had been in her kindest mood, and had smiled her sweetest with the soft tears in her eyes, and little balmy breaths of west wind that had opened the fragrant hearts of the wild-flowers to her, and made the young lambs leap with sheer happiness.

Pomona had begun her reign in the Kentish orchards quite a fortnight earlier than usual, and only morbid people prophesied frosts yet to come, and told of little blighted apples falling like hail, under its cruel touch, from trees that had been full of promise in blossoming time.

What troublesome things some people's memories are, on which are indelibly printed all the bad, unfortunate things in life!—snow on the Derby day, frosts in June, chilblains at midsummer, wet hay-making, drenched harvest fields; and there is no mark made by the much more frequent beautiful springs, sunny haytime, and plentiful harvests.

Sage had no such misgivings. The winter had sped away so pleasantly with that private view day to look forward to, which was to bring Maurice back to her, and it was further shortened by the letters from him that came every few days, and the almost equal delight of writing to him. His letters were not so long as hers; but that she did not expect; indeed, she hardly wished it. Men never wrote so much as girls, and, long or

* Copyright reserved in the United States of America.

short, his letters were just what they should be. Neither did they always come as regularly as her anxious little heart would have desired, a heart that kept her awake all the night before the post by which one of those missives might arrive, and leapt into her mouth when the postman's knock sounded on the door. But even this irregularity, she stoutly maintained to herself, she preferred, that he should not feel bound to write if it were inconvenient, or he was busy, for he knew that she was not exacting or unreasonable, like some girls, who fretted and took offence at the slightest delay. She would even persuade herself that she should be quite satisfied if he never wrote at all; and that she should quite like to prove to him in this way her entire trust in his love and constancy.

Owen Ludlow had been in London off and on all the winter, and his presence had done much to make the time pass pleasantly and quickly. But just a day or two before the private view, he was called away down to Sear, where good, puritanical Stock lay a-dying, and his kind, little, cheery wife badly wanted a friend. I am afraid happiness is apt to make us selfish, for Sage felt a little petulant vexation that this should have befallen just now, when Maurice was coming back, and when Owen Ludlow's presence at the studio would have made it available for so many pleasant meetings.

I am not sure that Owen Ludlow was not a little glad to be away at the private view. He had got used to his picture being seen, and had not the same shrinking from exposing it that he had felt when he first showed it to Sage and Kitty. Many of his fellow-artists had seen and criticised it, and it had been described in one of the society papers in 'A Visit to the Studios.' But there still lingered in his mind a dread of the gaze of the general public, and a sense that Pomona was his no longer, now that any one might look at her and pass their ignorant comments on her.

Maurice Moore had kept his promise, and had come home for it; and, as Sage told herself over and over again, had come home for good, having resigned his appointment. Not that he had at present any other occupation in view, though Owen Ludlow had done all he could, and Maurice had not been idle. But he thought it would be easier to find a berth if he were on the spot. He did not leave Edelstadt with quite as much satisfaction as he would have done at Christmas. Things had gone decidedly more pleasantly since then; the reigning beauty had deigned to be more gracious to him, having been disappointed in the new attaché, who was not nearly so agreeable as he appeared at first, and had, moreover, a *fiancée* in England, who detracted very much from his excellence. Miss St Clair was certainly very good-looking, and could be very agreeable when she chose; and she had it in her power to make society much pleasanter. He did not a bit waver in his preference for Sage; and he told himself constantly—a little too constantly—that he never regretted for a moment the sacrifice he was going to make for her; but he indulged in a good deal of harmless flirtation with Miss St Clair, and was conscious of a certain amount of regret in saying good-bye to her and the empty society life, which did not impress him as quite

as hollow and unsatisfactory as it had seemed before Christmas. But he was rather glad of this, he told himself, as it made the sacrifice on love's shrine more worthy.

That grimy, old monster London puts on a very pleasing appearance early in the season, at any rate at the West End. The flowers in the parks are a sight to see with the brilliant colours of tulips and hyacinths, and the window-boxes in fashionable houses are marvels of taste and sweetness. The drive is full of elegant carriages, with fair and graceful occupants; and in the Row the horses and the pretty faces and the well-turned-out young Englishmen make one proud of one's country, for there is not another capital in Europe, or, for that matter, in the world, that can show the like. Up above, the sky is blue, as if it was never obscured by fog or smoke; and the pavements look quite dazzlingly white, in contrast with the newly watered roads. Maurice Moore was much struck by the look of this much-abused London, that first day of his return; and perhaps it was in contrast with the brightness and trimness and air of stir and fashion in the West End that Dalston impressed him less favourably.

There was a dustiness already beginning to pervade the neighbourhood, and a tendency for bits of paper to blow about and whirl round corners; and the watering was done in a more rough-and-ready way than in the west, splashing on the pavements, and catching unwary foot-passengers across the legs. Providence had not been so kind in arranging circumstances pleasantly for Maurice Moore's return to Sage. Sarah opened the door in her least presentable condition. Cook had chosen this very inopportune moment to wash down the passage, and, in her agitation at Maurice's arrival, upset the pail, the contents of which rushed hospitably to meet him. There were two of Dr Merriew's patients waiting for cook's washing operations to be ended to pass into the surgery, patients whose very much enlarged cheeks made it easy to diagnose their case as one of mumps.

As he had arrived before he was expected, Sage was not ready to receive him; but Will, with a furiously bad cold in the head, was; and he engaged his services at once in his absorbing occupation of mending his white mouse's cage, proposing that Maurice should hold the occupant of the cage, while Will executed some repair with the glue-pot, which was emitting fearful smells from the fireplace.

It was better when Sage appeared, with a pretty little flush of haste on her cheeks, and her eyes shining with delighted welcome and love. He felt he could tolerate even the white mouse and the glue-pot for her sake. And she was looking greatly to advantage in a pretty fresh new dress, that she had bestowed much thought and pains upon, having begun to plan what it should be soon after Christmas. She had been awfully extravagant, she felt, in the matter of boots and gloves; and she had great qualms of conscience over the price of that little bonnet, though Dr Merriew paid the bill without the slightest remark. But she knew that the general effect was good; and though she blushed up to the roots of her hair under Maurice's smiling scrutiny, she felt he would have no need to be

ashamed of her, if he met any of his fashionable friends at the private view.

He could not quite conceal his haste to be off and clear of white mice and upset pails and mumps; and Sage felt a little bit sorry, as she hoped Dr Merridew would have come in before they went; and there were several things she would like to show Maurice—some sketches of Scar she had worked up; and a sketch of herself that Owen Ludlow had taken in crayons, and which she had had framed, on the chance of some one liking to have it. And besides, she felt a little remorseful at leaving Will alone, poor Will, who really had a very bad cold, and was in difficulties with the white mouse, known in the family as the Pink un, knowing that the servants would decline all assistance, as they regarded white mice as 'orrid things.'

But all these regrets were forgotten when they were once off in the sunny streets side by side. She gave herself over to perfect satisfaction; there was not a cloud to dim the sunshine, no care or anxiety or doubt to disturb the entire content. Let what would come after, the present was all that heart could desire, and why should it not always be the same, since it was Maurice's presence that made the happiness?

She made no expostulations on the score of economy, when he called a hansom; they would be wise another day, and she would preach prudence and advocate omnibuses and third-class tickets. She did not demur, either, at an elegant, little lunch that he ordered at a restaurant, though she guessed that it must have cost more than most of the meals of the entire Merridew family, servants included. Just for that one day they would be extravagant and enjoy themselves; and after that, be prudent, and go in for two-penny 'buses and buns for lunch, and enjoy themselves just the same.

Now they were at Burlington House. What splendid carriages were turning in; what gorgeous flunkeys were opening carriage doors; and what wondrous toilets issued therefrom, and swept or rustled up the broad steps! Every moment Maurice touched her arm to notice some celebrity passing, some society beauty whose photograph was in all the shops—an archbishop's glittered legs—some statesman who had come from affairs of vital importance to the country for a few minutes' relaxation with art—there a poet—here a millionaire—now a duchess—then an actor. Sage would have been content to stand all the afternoon and see this brilliant company pass by, with Maurice to tell her who each one was. But Maurice would not linger; and they went on up the stairs and passed straight on to the third room, where hung No. 540.

It looked wonderfully small. That was the first effect. Sage could hardly believe at first that it had not been cut down, or in some marvellous way diminished in size. In the studio at Scar it had seemed such a large picture; and, in her mind's eye, when she had fancied how it would look at the Academy, she had imagined it as among the more important canvases. It was on the line, and showed to great advantage, though Mr Ludlow had declared it was entirely killed and crushed by the big full-length portrait of an alderman's lady in crimson velvet just above it; but perhaps it was the

portrait that suffered, for Pomona showed out in comparison, fair and pure and refined in her white dress with the apple blossom shadow dappling it.

If Kitty had been there, she would have been greatly astonished that every one was not crowding round this picture; and even Sage, who realised that there were other pictures that would attract more attention, was a little surprised that, when they first came up to it, there was no one else looking at it.

'I wonder if any one will recognise you from the picture, Sage?' Maurice said. 'I never thought that Ludlow did you half justice. I don't fancy my portrait will be recognisable, though you declare that you knew me as Vertumnus at the first glance. It is rather humiliating to appear for the first time before the British public in the character of an old woman.'

There was a sort of fascination about the picture to them, though they knew every line and shade of it by heart; and it was interesting, too, to hear the remarks people made on it; but at last they were preparing to go on to the other pictures, when a clear, fresh, young voice behind them caught their ears, and they involuntarily stopped to listen.

'You really must show me this wonderful likeness of mine, Sir Robert. At least half-a-dozen people have been at me since I came in, talking about my portrait. I assure you it is the first I have heard of it.'

'But indeed, Miss Lester, if the likeness is accidental, it is the most marvellous thing I ever heard of. But you will see for yourself. Ludlow is the name of the painter, Owen Ludlow—surely you must know him.—Excuse me'—

This to a broad-shouldered lady, who was consulting her catalogue just in front of No. 540.

Maurice and Sage were standing too close to the speakers to allow of turning to look at them; but they were conscious that a tall girl was standing beside them, with a gentleman behind her, and, when the stout lady had moved away, the man's voice said: 'Now, you will confess'—

And then came a low, rippling laugh, and, after a pause: 'Well, I suppose there is a likeness; but it is a most curious accident, for I never even heard of Mr Ludlow before.'

'He must have seen you—there can be no doubt about that.—By Jove! it seems to me a piece of impertinence to introduce any one into a picture without asking permission. If I were Lady Lester'—

'Well, really, he has drawn a very complimentary portrait of me. I don't see that I have any reason to complain.'

A sputtering attempt at a compliment from the gentleman followed, during which Sage moved away, and Maurice following her, was able, without rudeness, to turn and look at the speakers. A little, fussy, middle-aged, military-looking man, with an eyeglass; and beside him a tall girl—Pomona herself, with the same smiling, sunny face and radiant blue eyes, and apple-blossom tints of complexion; the same bright, soft hair, crowned, curiously enough, with a little bonnet of apple blossom.

The conversation, of which Maurice Moore had heard every word, had only partly reached Sage's

ears; so she did not look with such lively curiosity as he did at the speaker, and did not get such a full view of her as he did, for the gallery was fuller than when they came in, and other people came in the way.

'Did you see, Sage? What an extraordinary thing!'

'She was rather like Pomona, wasn't she?'

'Rather? She might have stepped straight out of the canvas.'

'What odd things likenesses are!' Sage said absently.—'But oh! Maurice, look at that lovely landscape of Leader's!'

But Maurice could not appreciate the pictures. His mind was distracted by the living Pomona; and his eye kept straying from the pictures that so engrossed Sage, and from the catalogue, which he marked almost at random, seeking among the changing crowd the sweet, bright face that was so familiar to him from Ludlow's picture, that it seemed as if it were the face of an old friend.

Once they came across her again; and Maurice felt almost irritated with Sage's raptures over one of Alma Tadema's masterpieces, which entirely prevented her from looking up in time to see the smile with which Pomona received her catalogue, which some hasty passer-by had knocked out of her hold, and which Maurice restored to the little hand in a pearl-gray glove.

That second look made the likeness appear more bewildering than before; and he was so full of it, that he quite started when Sage's voice said, 'Are you tired, Maurice?' and he found her eyes looking at him with tender anxiety.

'Not a bit, dear,' he answered, with a laugh.—'But if you have had enough of the pictures, I want you to come to the Burlington Arcade. I have a fancy that I would like to give you a really good pair of gloves. Pearl gray, shall they be?'

And Sage agreed, with a little sigh of regret for those she had on, which she had been rather proud of, but which he was looking at now with a decidedly depreciating expression.

TRADES-UNION TRAMPS.

THE regular, unmitigated tramp's pet horror are the men who trudge from town to town in search of work—'travelling tradesmen,' as he calls them. Numerous and constantly changing, these are of two classes. There are non-unionists, who live principally by 'calling their trade,' or obtaining assistance from fellow-workmen in situations; and there are unionists, who are allowed by their organisations so much a mile or so much a day. These Society men, again, may be divided into those who voluntarily go on tramp, and those who are obliged to do so by the rules to which they subscribe. Some trades-unions do not compel any member to travel; while others—the Amalgamated Engineers is a case in point—exercise a discretionary power in the matter. The Typographical Society pursues a middle course. To induce its members to search for work, or, rather, to relieve the congestion of labour in large towns, it allows each man

a certain amount when he leaves a branch. A Society printer who has been in Manchester for some little time is given two pounds when he starts on tramp; but he cannot receive this allowance more than once in three years. Always, however, a trades-unionist who leaves a town in search of employment is supplied with a travelling card or certificate, on which is entered by branch secretaries the relief he receives on his journey.

The amount of assistance afforded varies greatly. Carpenters and joiners—and in this, as in all other cases, we of course speak of unionists only—are entitled to one shilling and fourpence a day, unless they be on strike, when they can demand two shillings and fourpence a day for six days in each week. Few, however, take a travelling card. Tailors receive a similar allowance on the road for only forty days in each year, between the months of August and April. During the summer, the busy season in the clothing trade, there is considered to be plenty of work for all. To plasterers the relief is one shilling and sixpence per district; but when they arrive in large provincial centres they are paid three shillings, two days' 'prov.;' and everywhere alike they are allowed one shilling and sixpence extra for Sunday.

Members of the Amalgamated Society of Engineers get when on travel the usual out-of-work pay, from six to ten shillings a week, according to the time they have been unemployed, and eightpence a day for bed and breakfast. Iron and tinplate workers, braziers, mounting forgers, tinnerns, stampers, and galvanisers, are relieved in accordance with the following rule of their Society: 'A member shall be entitled to one shilling a day for not more than thirty days in each statute year. Before being entitled to travelling relief for any one day, he must travel at least fifteen miles from one town towards another, except in the Birmingham district, which is to be comprised within a sixteen-mile radius of Wolverhampton, in which district eight miles from one town to another is to be considered to be one day's journey. In continuous travelling, the relief is still to be one shilling per day where sixteen miles or more are travelled.'

Some trade organisations give relief on another principle—that of distance, not time. The National Amalgamated Society of Operative House and Ship Painters and Decorators used to pay its members three-farthings a mile, and so much for a bed each night; but now it gives them only seven shillings per week for eight weeks in the winter; and if they choose to travel, they have to depend for relief on painters and decorators whom they may be able to find working. At present, the principal Society which pays 'mileage' is the Typographical Association. Last year, its expenditure in this direction was more than twenty-two thousand pounds—an enormous sum, considering that a printer on tramp is entitled

to only one penny per mile, that he cannot receive more than eleven shillings and eightpence (including an allowance of one shilling and eightpence for Sunday) in any one week, and that the maximum sum he can draw at this rate is eight pounds. Should he not then have obtained work, however, he is entitled to 'second-class mileage'—that is, a halfpenny a mile.

Many Societies, besides those mentioned as doing so, allow a certain sum for Sunday, and the generality of 'travelling tradesmen' can easily obtain something in addition to official relief. When a man makes an unsuccessful application for work at an office or 'shop' where he is known, a collection is often made among the journeymen for him; and the same thing is done almost invariably when a workman on tramp drops in at a lodge meeting of his Society. Sometimes, too, he is presented with a small grant from the Incidental Fund.

The income of a man on tramp, therefore, largely depends on the route he takes—a matter as to which he is not often allowed freedom of choice. Printers may go where they like. Attached to their card is a map of routes, by the aid of which they can find their way all over the country. But, as a rule, the traveller is directed by the branch secretaries on whom he calls, and they guide him according to strikes, the state of trade in particular districts, and other circumstances.

His journey, let him go where he will, is too often a degrading and disheartening experience. Live on the cheapest and commonest of food he must; generally, he is also contaminated by the vile associations of the common lodging-house. There are trades-unions—such, for example, as the Amalgamated Engineers—which provide good beds for members on travel; but, as a general thing, the amateur tramp must get the best lodgings he can. For cheapness he goes to 'four-penny doss houses,' and in those objectionable 'travellers' hotels' all his indoor life for weeks, perhaps months, is spent.

One man, an iron-turner by trade, has thrice been on the road—for two months, ten weeks, and thirteen weeks respectively—and every time he was unsuccessful in his quest for work. Another—a printer—started off from Manchester and tramped all over England, visiting towns as far apart as Newcastle, Birmingham, York, Oxford, Plymouth, Taunton, Cardiff, Lewes, Winchester, St Albans, Hull, Leamington, Hereford, and Hanley. He walked, in fact, through nearly every county in England, and was away altogether seven months, during which he obtained casual labour representing only three weeks' work. Similar instances might be cited in abundance. It is, indeed, a common thing for a man to reach the limit of the official travelling allowance when he is many miles from home and friends, and to have to work his way back, as the non-unionist 'tramping tradesman' lives regularly, by 'calling his trade.'

This is a custom greatly abused. Should a navvy apply for work on an engineering undertaking, and not be started, the men who are on the job give him a shilling to help him on the
